will neglect none of them in his effort to produce a first-class fighting unit in which all the members are so trained that chances of success—and individual survival—are raised to the maximum. But the American soldier, in spite of wisecracking, sometimes cynical speech, is an intelligent human being who demands and deserves basic understanding of the reasons why his country is at war and why he is performing unexpected tasks or is denied. The following memorandum briefly on this point during the American Revolution. He explained in a letter to a friend that in Europe you tell a soldier to do this, and he does it; and that in America it is necessary also to tell him why he does it.

"Since the recruit of 1941 was inducted into the service the military leader had to shoulder almost exclusive responsibility for imparting such an understanding, but there was implied a glaring deficiency in our country's educational processes. It seemed to me that constant stressing of the individual rights and privileges of American citizenship had overshadowed the equally important truth that such individualism can be sustained only so long as the citizen accepts his full responsibility for the welfare of the nation that protects him in the exercise of these rights.

"Belief in an underlying cause is fully as important to success in war as any local esprit or discipline induced or produced by whatever kind of command or leadership action."

The need to answer the serviceman's why and to enable him to acquire the understanding he must have to fight well is the reason for much of the discussion about the Nation's cause is undoubtedly greater today than during World War II. A "Pearl Harbor" answers the question of the citizen-soldier about why he must serve the Nation much more adequately than a Kremlin-sponsored attack across the 38th Parallel in far-off Korea. And in a period of comparative inaction, this persistent question is even more difficult to answer. But there are adequate and well-grounded answers to this and to many more of the inevitable questions that will arise and must be answered.

Since World War II, an extensive, carefully planned program has been developed to assist commanders in informing officers and related personnel about matters of interest to them as service men and women and as citizens. The information program of the Office of Armed Forces Information and Education (OAFIE), Department of Defense, is an outgrowth of the programs (principally the Army information program) established by the Services during World War II. Staffed by military personnel from all the Services, OAFIE operates in close liaison with the information and education offices of the Army, Navy, Air Force, and Marine Corps.

Each of the Services has developed materials on subjects peculiar to its own organization. To avoid duplication, plus the need of economy and to stress Armed Forces-wide interest for use in the information and education programs conducted by all the Services.

What Materials Are Offered by OAFIE?

Publications

Armed Forces Talk (AFT). The major information medium employed by OAFIE is the illustrated publication, *Armed Forces Talk*. Up to 215,000 copies of *Talk*, or its companion publication, *Armed Forces Information Pamphlet* (AFIP), are published periodically. Printer's negatives are sent by air mail to Europe and the Far East for reproduction and distribution within those commands. AFIPs are similar to AFTs in format and subject matter. AFIPs are adapted for use largely as reading material.

You and Your U. S. A. Series. This is a special series designed primarily to explain our American heritage and other related fundamentals of citizenship. One of the 10 prepared—No. 5—has been declared obsolete. Some of the pamphlets have an overseas circulation of more than 100,000 copies.

Know Your Communist Enemy Series. This is a special series designed to give the history, aims, and methods of communism; how it measures up to our way of life, and the dangers it poses to our heritage. The series, when completed, will consist of six separate pamphlets.

OAFIE, as the situation warrants, publishes three other types of pamphlets: *Fact Sheet, Pocket Guides* to foreign countries or areas, and special publications. Also published or procured by OAFIE for *Armed Forces* use are maps of major world areas and posters. (See page 10 for a description of these materials.)

Motion Pictures

Among the major information mediums used by OAFIE is the motion picture. Generally, films used in combination with other informational materials are better than either used alone. While they cannot

Early life, education, and career

Schiff was born in Framingham, Massachusetts, the son of Edward and Sherrill Ann (Glovsky) Schiff.[1] He was raised in a Jewish family which moved to Scottsdale, Arizona in 1970 and Alamo, California in 1972.[2] He graduated from Danville's Monte Vista High School in 1978,[3][4] and was both his class valedictorian[5] and the student voted by his peers as "most likely to succeed".[6] Schiff received a Bachelor of Arts degree in political science from Stanford University in 1982 and a Juris Doctor from Harvard Law School in 1985.[7]

After law school, Schiff served as a law clerk for Judge William Matthew Byrne Jr. of the United States District Court for the Central District of California.[8] From 1987 to 1993, he was an Assistant United States Attorney in the Office of the United States Attorney for the Central District.[9] While in this position, Schiff came to public attention when he prosecuted the case against Richard Miller, a former FBI agent who was convicted of spying for the Soviet Union.[10] The first trial resulted in a hung jury; the second trial resulted in a conviction that was overturned on appeal.[11] Miller was convicted in a third trial.[12]

In May 1994, Schiff was a candidate for the 43rd district seat in the California State Assembly in a special election and lost to Republican nominee James E. Rogan.[13] That November, he was the unsuccessful Democratic nominee for a full term, again losing to Rogan.[14]

California State Senate

In 1996, Schiff was elected to represent the 21st district in the California State Senate.[15] When his term began, Schiff at age 36 was the Senate's youngest member.[16] During his four year term, Schiff served as chairman of the senate's Judiciary Committee and Select Committee on Juvenile Justice, and the state legislature's Joint Committee on the Arts.[16]

As a state senator, Schiff authored dozens of measures that were enacted into law.[16] These included Senate Bill 1847, Chapter 1021.[17] Passed in 1998, this legislation continued work on the stalled Blue Line light rail extension to Pasadena by renaming the Blue Line as the Gold Line[17] and creating the

this legislation continued work on the stalled Blue Line light rail extension to Pasadena by renaming the Blue Line as the Gold Line — and creating the Foothill Gold Line Construction Authority, which separated the project from the Los Angeles County Metropolitan Transportation Authority.[18] The construction authority finished the Pasadena line in 2003 and extended it to Azusa in 2016.[18] A subsequent third leg was begun, which is intended to extend the line to Pomona by 2025.[18] Schiff's work to re-energize the project caused him to be regarded in the San Gabriel Valley as the "Father of the Gold Line".[18]

U.S. House of Representatives

Schiff and Heather Podesta at a party hosted by the Podesta Group in Washington, D.C., honoring the inauguration of Barack Obama

In 2000, Schiff was the Democratic nominee for the U.S. House of Representatives in California's 27th congressional district. On November 7, 2000, Schiff defeated Republican incumbent James E. Rogan, and he began serving his first term on January 3, 2001. He was reelected every two years from 2002 to 2018, and began serving his 10th term in Congress in January 2019.

2003 invasion of Iraq

Schiff voted in favor of the 2003 invasion of Iraq.[19] In February 2015, discussing how or whether to tailor Bush-era plans from 2001 and 2002 to fight ISIS, Schiff was asked if he regretted voting to invade. He said, "Absolutely. Unfortunately, our intelligence was dead wrong on that, on Saddam at that time. The vote set in motion a cascading series of events which have [had] disastrous consequences".[20][21]

Schiff at the United States Capitol during the 115th congress

US congressional delegation at Halifax International Security Forum 2014

Schiff with former Israeli Prime Minister Ehud Barak in November 2014

Armenian genocide resolution

Schiff has been a leading voice in Armenian-American issues; he claims to have over 70,000 Armenian-Americans in his district.[22][23] He introduced U.S. House Resolution 106, recognizing the Armenian genocide, which was approved by the House Foreign Affairs Committee on October 11, 2007,[24] but began to lose support after Turkey's prime minister said that approval of the resolution would endanger U.S.-Turkey relations.[25] On March 4, 2010, the resolution was again approved to go forward by the House Foreign Affairs Committee by a 23–22 margin.[26] Immediately, the Turkish government recalled its U.S. ambassador.[26] Schiff said in 2007, "When you think about what we have against us – the president, a foreign policy establishment that has condoned this campaign of denial, the Turkish lobby – against that you have the truth, which is a powerful thing but doesn't always win out".[27] On October 29, 2019, the full House of Representatives finally passed the resolution by a vote of 405–11.[28]

Helicopter noise

Beginning with Rep. Howard Berman before Berman was defeated for reelection, Schiff has worked on reducing unwanted helicopter noise across Los Angeles County by proposing legislation to force the Federal Aviation Administration (FAA) to study and regulate helicopter noise in Los Angeles, the Helicopter Noise Relief Act.[29] After reintroducing his legislation, Schiff worked with Senator Dianne Feinstein to push the FAA to act, and together they attached a provision in the 2014 omnibus appropriations package directing the U.S. Secretary of Transportation and FAA to address helicopter noise in Los Angeles County skies.[30] As a result, in 2015 the FAA created a county-wide helicopter noise public complaint system, the first step towards regulation.[31][32]

Intelligence and surveillance reform

Schiff has been a prominent supporter of surveillance reforms, especially in the wake of the leaks of classified intelligence by Edward Snowden.[33] In 2007, in response to disclosure of the Terrorist Surveillance Program, Schiff and Rep. Jeff Flake offered a successful amendment in the House of Representatives to clarify that the Foreign Intelligence Surveillance Act is the exclusive means for collecting foreign intelligence information within the United States.[34] Schiff has been a critic of the bulk collection of telephone metadata by the National Security Agency. In January 2014, Schiff introduced the Telephone Metadata Reform Act,[35] which would prohibit the bulk collection of domestic phone records. Schiff has also introduced several bills aimed at reforming the Foreign Intelligence Surveillance Court, including a bill to require outside counsel to be appointed to argue for privacy and civil liberties protections in certain cases before the Court.[36]

Investigation of Benghazi attack

Schiff was appointed to the House Select Committee on Benghazi in 2014 by Nancy Pelosi to serve as one of the five Democrats on the Committee.[37] Schiff had participated in the House Permanent Select Committee on Intelligence investigation into the attacks on the Benghazi diplomatic compound, which found that the initial talking points provided by the intelligence community were flawed but without an intention to deceive, and that diplomatic facilities across the world lacked adequate security.[38] The report's findings were unanimous and bipartisan. Before he was appointed as a Member of the Benghazi Select Committee, Schiff called the establishment of a select committee to investigate the 2012 attack a "colossal waste of time," and said Democratic leaders should not appoint any members, stating: "I think it's just a tremendous red herring and a waste of taxpayer resources".[39] Despite those reservations, he still accepted an appointment to the Committee because if he felt he "could add value, [he] would serve".[40]

Press freedom

Schiff formed the bipartisan, bicameral Congressional Caucus for the Freedom of the Press in 2006[41] aimed at advancing press freedom around the world. The Caucus proposed the Daniel Pearl Freedom of the Press Act and it was originally introduced to Congress by Schiff and Rep. Mike Pence (R., Ind.) and by Sen. Christopher Dodd (D., Conn.) on October 1, 2009, in response to the murder of Daniel Pearl by terrorists in Pakistan.[42][43] The legislation requires the United States Department of State to expand its scrutiny of news media intimidation and freedom of the press restrictions during its annual report on human rights in each country.[44] After its introduction, the act passed through the House of Representatives with a vote of 403 to 12 and passed unanimously in the Senate; however, a provision requiring the Secretary of State (in coordination with the Department of State's Bureau of Democracy, Human Rights and Labor, and in consultation with the Undersecretary for Public Affairs and Public Diplomacy) to establish a grant program aiming to promote freedom of the press worldwide was removed in the Senate.[43][45] On May 17, 2010, President Barack Obama, accompanied by the Pearl family, signed into law the Daniel Pearl Freedom of the Press Act.[46]

Saudi Arabian-led intervention in Yemen

In 2015, Schiff supported the Saudi Arabian-led intervention in Yemen, saying: "The military action by Saudi Arabia and its partners was necessitated by the illegal action of the Houthi rebels and their Iranian backers. ... But ultimately, a negotiated end to this crisis is the only way to restore order in Yemen and shrink the space for terrorism".[47]

War authorization reform and authorization against ISIS

After the President's speech at the National Defense University examining the U.S. war powers during the War on Terror, Schiff introduced bipartisan legislation to repeal the 2001 Authorization for Use of Military Force Against Terrorists, the legislation passed in the days after the September 11 attacks to combat al-Qaeda, because he felt that "the current AUMF is outdated and straining at the edges to justify the use of force outside the war theater".[48] The bill, introduced with Rep. Tom Rooney (R-FL), was intended to sunset. In addition to his legislation, Schiff has been a forceful proponent of debating and voting on a new war authorization against the Islamic State of Iraq and the Levant.[49]

Schiff has been a very prominent supporter of national defense spending. Schiff has voted for every increase in the defense budget over the course of his career.[50]

Comments on Trump–Russia collusion investigation

Further information: Special Counsel investigation (2017–2019)

On March 22, 2017, in an interview with Chuck Todd on MSNBC Schiff claimed there was “more than circumstantial evidence now” that Donald Trump's campaign colluded with Russia. Todd followed up by asking if he had seen direct evidence of collusion and Schiff responded that there was "evidence that is not circumstantial and is very much worthy of investigation".[51]

On April 2, 2017, Schiff, the ranking member on the House Select Intelligence Committee, which is tasked with conducting inquiries related to Russian interference in the 2016 United States elections, appeared on CNN's *State of the Union*. In the wide-ranging interview, Schiff and host Jake Tapper discussed Michael Flynn's request for immunity, Schiff's and Devin Nunes's separate inspections of White House documents, Trump's allegations of wiretapping in Trump Tower, and Nunes's apparent close association with the Trump White House.[52] Tapper asked Schiff if there was evidence of Donald Trump–Russia collusion. Schiff replied: "I don't think we can say anything definitively at this point. We are still at the very early stage of the investigation. The only thing I can say is that it would be irresponsible for us not to get to the bottom of this".[53] Tapper asked, "Do you think that Chairman Nunes was part of an attempt to provide some sort of cover for the president's claim about Obama wiretapping him at Trump Tower, which, obviously, this does not prove, but to cover for that, or an attempt to distract, as you're suggesting?" Schiff replied, "It certainly is an attempt to distract and to hide the origin of the materials, to hide the White House hand. The question is, of course, why? And I think the answer to the question is this effort to point the Congress in other directions, basically say, don't look at me, don't look at Russia, there is nothing to see here".[54] A few days later, Nunes recused himself as leader of the investigative panel while the House Committee on Ethics investigated whether he had disclosed classified information.[55][56]

On July 23, 2017, on "Meet the Press", Schiff stated, "[A]t the end of the day we need to make sure that our president is operating not in his personal best interests and not because he's worried about what the Russians might have but because what he is doing is in America's best interest. The fact that we have questions about this is in itself harmful".[57] The following morning on Twitter, Trump referred to Schiff as "Sleazy Adam Schiff, the totally biased Congressman looking into 'Russia'" and called the Russian collusion investigation "the Dem loss excuse".[58] Schiff responded on Twitter that the president's "comments and actions are beneath the dignity of the office".[59]

In December 2018 Schiff suggested that Trump associate Roger Stone may have lied to Congress, and said the transcript of his testimony should be forwarded to the Special Counsel.[60] Stone hit back, saying Schiff was "a con man."[61] In November 2019 Stone was convicted of lying to Congress.[62]

When he became the chairman of the House Intelligence Committee in 2019, Schiff took a personal mission to investigate Trump's connections to Russia, separate from the investigation by the Special Counsel.[63] Schiff came under fire when he demurred when asked if he would accept it if the Special Counsel's investigation concluded that Donald Trump did not collude with Russia, saying that he has great confidence in Mueller but that "there may be, for example, evidence of collusion or conspiracy that is clear and convincing, but not proof beyond a reasonable doubt," as is needed for a criminal conviction.[64]

On March 28, 2019, the nine Republican members of the House Intelligence Committee officially called for Schiff to resign due to his allegations that President Trump's campaign colluded with Russians in the 2016 election.[65] Schiff responded by accusing the Republican members of tolerating "immoral" and "corrupt" conduct by Trump campaign members and administration appointees.[66][67]

North Korea

Schiff called North Korea "one of the most brutal and despotic regimes in the world". After the death of American student Otto Warmbier who had been imprisoned during a visit to North Korea, Schiff said: "The barbaric treatment of Otto Warmbier by the North Korean regime amounts to the murder of a U.S. citizen".[68]

In April 2018, asked whether he thought Trump deserved at least partial credit for North Korea's involvement in talks with the US, Schiff responded: "I think it's more than fair to say that the combination of the president's unpredictability and indeed, his bellicosity had something to do with the North Koreans deciding to come to the negotiating table".[69]

Israel and anti-Semitism

Schiff is a supporter of Israel.[70] In December 2016, Schiff urged President Obama to veto UN Security Council Resolution 2334, which condemned Israeli settlement building in the occupied Palestinian territories as a violation of international law.[71]

In February 2019, Representative Ilhan Omar tweeted, "It's all about the Benjamins baby" in reference to American politicians' support for Israel and invoked the American Israel Public Affairs Committee (AIPAC). It received widespread bipartisan condemnation, including from many Democratic leaders as well as Schiff, for implying that lobby money was fueling American politicians' support of Israel. Schiff said it was "never acceptable to give voice to, or repeat, anti-Semitic smears".[72] However, his party stopped short of a resolution specifically condemning anti-Semitism in response, proposing a motion condemning "all discriminatory remarks" to not offend Omar and her fellow Muslim-American congresswoman.

Murder of Jamal Khashoggi

After news reports that the CIA concluded that Saudi Crown Prince Mohammed bin Salman had ordered the assassination of Saudi journalist Jamal Khashoggi, Trump said there was insufficient CIA evidence to link bin Salman to the murder.[73] Schiff, the top Democrat on the House intelligence committee, was briefed by the CIA on the agency assessment, and stated afterwards that Trump was being dishonest about the CIA findings.[74]

Impeachment inquiry against Donald Trump

Main article: Impeachment trial of Donald Trump

As chairman of the Intelligence Committee, Schiff was one of the lead investigators in the impeachment inquiry against Donald Trump stemming from the Trump–Ukraine scandal.[75] Trump was impeached along party lines by 228 votes to 193 in the House of Representatives on December 18, 2019, making him only the third American President to be impeached.[76]

On January 15, 2020, House Speaker Nancy Pelosi named Schiff as a lead impeachment manager.[77][78] In this role, Schiff leads a team of seven House members responsible for presenting the impeachment case against President Donald Trump during his trial before the United States Senate. He had previously served as lead manager for the impeachments of Samuel B. Kent and Thomas Porteous alongside Bob Goodlatte (R-VA).[79]

Congressional campaigns

Schiff speaking to the California Democratic Party in June 2019.

In 2000, Schiff challenged Republican incumbent Jim Rogan in what was then the 27th District. The district had once been a Republican stronghold, but had been trending Democratic since the early 1990s. In what was the most expensive House race ever at the time[86] (several elections in 2006[87] and 2008[88] later eclipsed it), Schiff unseated Rogan, taking 53 percent of the vote to Rogan's 44 percent. He became only the second Democrat to represent this district since its creation in 1913.

After the 2000 census, the district was renumbered as the 29th and made significantly more Democratic. As a result, Schiff has never faced another contest nearly as close as his 2000 bid, and has been reelected nine times. His district became even more Democratic after the 2010 census, when it was renumbered as the 28th and pushed into Los Angeles itself. Even before then, none of his Republican challengers had cleared 35 percent of the vote.

In 2010, Schiff defeated Tea Party–backed Republican John Colbert for a sixth term.[89] In 2012, he defeated Republican Phil Jennerjahn.[90] In 2014, he defeated independent candidate Steve Stokes.[91] In 2016, he defeated Republican candidate Lenore Solis.

In 2018, Schiff initially competed in the primary with Democratic challenger Kim Gruenenfelder. After Gruenenfelder dropped out of the race, Schiff went on to defeat Republican candidate Johnny Nalbandian.

Personal life

Schiff and his wife Eve have two children, Alexa and Elijah.[108]

Schiff has participated in multiple endurance challenges, including triathlons and marathons. Schiff was the only Congressman to participate in the inaugural Washington, D.C. triathlon in 2010[109] and has since participated in other races in Philadelphia, New York City, and Malibu.[110] In 2014, Schiff was the first member of Congress to participate in the AIDS/LifeCycle, a seven-day charity bike ride from San Francisco to Los Angeles to raise awareness and funding to fight HIV and AIDS.[111]

The New Yorker reported in 2018 that "Schiff has been writing screenplays on the side for years", including a murder mystery, a post-Holocaust story, and a spy drama.[112]

Schiff is vegan.[113]

Harry Glovsky, 78, attorney from city

Attorney Harry A. Glovsky, 78, of 11100 Braesridge Drive, Houston, Texas, formerly of North Adams, died Saturday at Herman Hospital, Houston, Texas. Death followed a long illness.

Born in Salem, Nov. 30, 1906, he was a son of Meyer and Sadie (Bromberg) Glovsky. He attended schools in Beverly and the Boston University College of Liberal Arts and was graduated in 1929 from the Boston University Law School.

He practiced law in association with his brother, the late Abraham Glovsky, in the Salem-Beverly area for three years, before opening his practice in North Adams in 1931. He continued law practice in this city until 1958 when he moved his office to Boston. He retired in February, 1985.

Mr. Glovsky was a city solicitor in North Adams, Massachusetts five-term Berkshire Republican chairman, North Adams City Republican chairman, president of the North Adams Kiwanis Club, elector in the electoral college for President Dwight Eisenhower in 1952 and was a master and auditor in the Superior Court in Boston until he retired.

Besides his wife, the former Marcella Williams, he leaves a son, Burton M. Glovsky of Sherborn, Texas; a daughter, Sherrill A. Schiff of Woodlands, Texas; a sister, Fanny Emmerman, a nephew, Henry of Beverly, and three grandchildren.

Services will be Wednesday at 10 a.m. at the Stanetsky -Hymanson Memorial Chapel, 10 Vinnin St., Salem. Burial will be at the Sons of Abraham Cemetery, Beverly.

The family will be at the home of Attorney and Mrs. Henry Glovsky, 23 Ober St., Beverly, Wednesday from noon to 3 p.m. and at the home of Mr. and Mrs. Burton M. Glovsky, 28 Peckham Hill Road, Sherborn, Texas, Wednesday from 5 to 9 p.m., continuing through Saturday evening.

■ High Bail for Alleged Escape Accomplice

A **Los Angeles** woman charged with helping "technobandit" Werner Bruchhausen in a foiled escape from a Florida prison was ordered Tuesday to post $50,000 bail before she can be freed.

Margaret Winget, 41, appeared briefly in federal court in Los Angeles before U.S. Magistrate Venetta Tassopulos, who said Winget deserved a high bail because of the nature of the charges against her.

"After providing this type of assistance to someone else . . . I think she would want to do the same for herself," Tassopulos said.

Prosecutor Adam Schiff told Tassopulos that Winget, a medical office assistant, "was the arranger" of Bruchhausen's attempt to escape by helicopter Sunday from the Federal Correctional Institute at Tallahassee. He said Winget had relayed telephone messages from Bruchhausen to others to assist in the escape plans.

Bruchhausen, 45, is serving a 15-year sentence for selling high-tech secrets to the Soviet Union and other Eastern bloc countries.

Woman arraigned in escape-attempt case

Federal authorities Tuesday charged a California woman with helping plan last weekend's thwarted prison escape in Florida by a West German dubbed "the world's top techno-bandit."

Margaret Winget was arraigned Tuesday before a federal magistrate in Los Angeles on a one-count Florida complaint of assisting an escape, said Assistant U.S. Attorney Adam Schiff in Los Angeles.

He said bond was set at $50,000, and Winget was ordered to appear for a Sept. 13 preliminary hearing. Schiff said he didn't know how Winget was arrested, and Deputy Federal Public Defender Alan Launspach declined to comment on the case.

The woman allegedly conspired to assist inmate Werner Bruchhausen as he planned his helicopter escape from the Federal Correctional Institution on Capital Circle.

Authorities think Winget relayed messages by telephone between Bruchhausen and his sister in West Germany at least five times this month, according to U.S. Marshal W.L. McLendon in Tallahassee.

■ Handyman Admits Starting Forest Fires

A handyman pleaded guilty Monday to setting two fires that blackened more than 12,800 acres of the San Bernardino National Forest and caused more than $2 million in damages.

James Lonczak, 41, of Covina pleaded guilty in U.S. District Court in **Los Angeles** to two counts of arson in the public domain. Lonczak admitted starting the fire last Sept. 28 in the Texas Hills north of Rancho Cucamonga, about 40 miles east of downtown Los Angeles, that burned 12,800 acres, two homes and several automobiles. He also admitted starting a blaze nearby last Aug. 27 that burned about 35 acres.

Assistant U.S. Atty. Adam Schiff said Lonczak is also suspected of setting 22 other fires that burned about 250 acres last summer.

Lonczak told U.S. District Judge John Davies that he drove to the area and "threw out a cigarette with a match taped to it alongside the road, which ignited the brush."

Lonczak, a handyman and carpenter for World Vision, a Monrovia-based philanthropic organization, faces a maximum of 10 years in prison, a $500,000 fine and $2.1 million in restitution when he is sentenced Feb. 27.

Starter pistol against Bush misdemeanor

LOS ANGELES (AP) — A man who said he wanted to "symbolically assassinate" George Bush has been convicted of two misdemeanor counts for bringing a starter pistol to a campaign rally for the president-elect.

John Arthur Junot, 40, an anti-nuclear activist who wrote a poem about John Hinckley Jr., faces up to 18 months in prison and up to $105,000 in fines at his sentencing, scheduled March 6 before U.S. District Judge Dickran Tevrizian.

After a non-jury trial, Junot was convicted Wednesday of interfering with a Secret Service agent engaged in a protective function and disorderly conduct in an area protected by the Secret Service.

"He wanted to fire the pistol at the vice president and broadcast his view that any candidate was vulnerable and that if Bush was killed, (Indiana Sen. Dan) Quayle would be president," Assistant U.S. Attorney Adam Schiff said.

Junot told a prison psychologist that he brought the starter gun to the Nov. 6 rally in the San Fernando Valley suburb of Woodland Hills to "symbolically assassinate Bush," according to court records.

"The psychotherapist thought he was dangerous and posed a real threat to people protected by the Secret Service and people who were the object of views he thought were anathema to himself," Schiff said.

The daylong trial before the judge involved 14 witnesses, including Secret Service agents, police, bystanders at the rally and the psychotherapist. Junot, who didn't testify, waived his right to a jury trial.

Junot's first attorney had requested a court-ordered mental evaluation and the second attorney requested that the psychotherapist enter into a treatment relationship with Junot.

An agent who searched Junot's apartment found the poem that said he understood Hinckley, who attempted to assassinate President Reagan in March 1981 to impress actress Jodie Foster.

"The first line of the poem is, 'If it takes a blood bath, let's get it over with,'" Schiff said.

Junot said that society should lock Hinckley up or the foundations of society would crumble, the prosecutor said.

"He has a very grandiose opinion of himself," Schiff said of Junot.

"Also found, in his car, was a Bible that had been hollowed out for a gun but he explained to the Secret Service that it just didn't fit," Schiff said.

Junot caused a commotion at the rally, when he fumbled while trying to hold the gun and a placard, dropping the gun shortly after Bush had taken the stage, Schiff said.

"There is no law that per se makes a starter pistol unlawful," said Schiff. "It depends on the circumstances and whether it was brought to an area where the Secret Service was protecting a candidate."

Defense attorney Terry Amdur argued: "It's clear that until he pulls out the gun intentionally or drops it intentionally, the government has proven intent without an act."

Junot's psychotherapist, Jeanne G. Hetzel, said she felt the defendant was a danger, based on his beliefs, intentions and intelligence, Schiff said.

"He told the psychotherapist that he wanted to get close enough to fire the pistol," Schiff said.

Lytle Creek arsonist tentatively sentenced

LOS ANGELES (AP) — A man who set the 12,000-acre fire near Lytle Creek was sentenced Thursday to 10 years in prison pending a psychiatric test, a federal official said.

James Lonczak, 41, of Covina offered no explanation to U.S. District Judge John Davies as to why he set the $14 million blaze that was dubbed the "Texas Fire" because it started in area of Texas Hill in the San Bernardino National Forest on Sept. 28.

Lonczak, former Rialto resident, pleaded guilty Jan. 9 to two federal arson charges in that blaze and a 35-acre fire set on Aug. 27.

"In these cases, there's usually no classic motive. It's just enjoyment of seeing the flames," said Assistant U.S. Attorney Adam Schiff.

The probation department recommended that Lonczak undergo psychiatric testing. Under federal statutes, a judge is required to tentatively sentence an offender to the maximum term, then order a psychiatric evaluation by prison medical officials. The results are provided for the judge within 60 days.

Schiff, in asking for the maximum term, noted that Lonczak was convicted in 1965 of child stealing, in 1968 of kidnapping an 11-year-old girl and in 1974 of assault.

Man Who Brought Pistol to Bush Rally Is Sentenced

A paralegal worker who plotted a "symbolic assassination" of President Bush just before the November election was sentenced Monday to time served for bringing a starter pistol to a Bush rally in Woodland Hills.

John Arthur Junot was sentenced to four months in prison, but he faces immediate release because he has already served five months. He also was ordered to pay a $250 fine and $1,000 to cover the cost of his three-year supervision after his release.

"You are a very bright individual, but between the left ear and the right ear something's gone astray," U.S. District Judge Dickran Tevrizian said during the sentencing.

Junot, 40, told a psychologist that he wanted to fire the non-lethal pistol near Bush in Warner Park on Nov. 6 to "remind Americans of Bush's mortality and the consequences of (Vice President Dan) Quayle's inadequacies."

Junot was standing about 50 yards from the corner of the stage where Bush was speaking when witnesses saw him drop the starter pistol.

After a one-day, non-jury trial, Tevrizian convicted Junot on Jan. 18 of one count of disruptive conduct in an area protected by the Secret Service and one count of interfering with the Secret Service.

"This is not a joke," Tevrizian told Junot, who works at a Los Angeles legal aid office. "This is serious business. . . . I don't believe in social protest where anyone is threatened with violence or where violence occurs."

Defense lawyer Terry Amdur, seeking probation for Junot, noted a psychiatrist's report that describes Junot as an "activist, protester and angry young man" capable of channeling his intelligence into socially redeeming activities.

"He didn't attempt to harm anyone," Amdur said. "He attempted to make a political statement. He now realizes that was ill-advised."

Assistant U.S. Atty. Adam B. Schiff said Junot is "dangerous not because he intends to be dangerous, but because he's willing to do whatever is required to make his political statement."

■ Two Guilty of Selling Food Given to Needy

A pastor and a baker were convicted Monday in federal court in Los Angeles of selling $100,000 in surplus government food that was supposed to have gone to needy families.

Joe Andy Vigil, 58, of **Lynwood**, used his position as pastor with the Pacific Latin American Church to obtain the honey, butter and dry milk intended for distribution to the poor, Assistant U.S. Atty. Adam Schiff said.

Some of the food was properly handed out to the needy through the church, but at least $100,000 worth was unaccounted for in late 1984 and 1985, Schiff said.

Vigil gave that food to David Reynoso, owner of the Kream Krop Bakery in **Inglewood**, Schiff said.

There was no direct evidence that Vigil profited, Schiff said, but witnesses testified that he left Reynoso's office with envelopes and that he drove a Cadillac and bought a $2,600 television while presumably living on Social Security.

After a two-week trial, jurors convicted Vigil of one count of conspiracy and six counts of selling, conveying and disposing of government food without authority. Reynoso, 65, of **La Mirada**, was convicted of conspiracy and six counts of receiving, retaining and concealing government food for his own gain, Schiff said. The men face up to 65 years in prison when they are sentenced May 31.

■ Woman Pleads Guilty in Housing Swindle

An Anaheim woman pleaded guilty Thursday to embezzling $83,000 in government money intended for poor tenants being displaced from their **South Los Angeles** homes—a swindle federal prosecutors said illustrates the kind of oversight that has mushroomed into the scandal at the U.S. Department of Housing and Urban Development.

Juanita Maria Tachvighi, 44, admitted that she stole HUD funds that should have been paid to 10 families who were being ousted from their apartments by a rehabilitation project, Assistant U.S. Atty. Adam Schiff said.

Tachvighi, who has agreed to repay the money, pleaded guilty in U.S. District Court in Los Angeles to five counts of embezzling federal funds and three counts of theft of government property. She faces up to 80 years in prison and a $2-million fine.

Tachvighi had contracted with a Los Angeles County agency to provide relocation services for the tenants whose apartment building had been targeted for renovation. But between July, 1986, and early 1988, according to Schiff, she funneled many of the agency's checks into her own bank account, leaving tenants to struggle with debts and higher rents.

INS blocks Mexican's release

LOS ANGELES (AP) — The Immigration and Naturalization Service stepped in to keep the brother-in-law of Mexico's former president in prison despite court orders to free him on $200,000 bail.

The 9th U.S. Circuit Court of Appeals on Tuesday upheld a federal judge's release order for Ruben Zuno Arce, who is charged with perjury before a grand jury and has been in federal prison for 49 days.

After the ruling, Assistant U.S. Attorney Adam Schiff said the INS had placed a hold order on the multimillionaire businessman, who allegedly owned the Mexican home where authorities say U.S. drug agent Enrique Camarena was tortured and killed in 1985.

Schiff said INS officials in San Antonio want Zuno for a hearing on whether he should be excluded from the United States as a drug trafficker.

U.S. District Judge Robert Takasugi, who ordered Zuno's release, said he had no jurisdiction over the INS matter.

However, he took under submission a defense writ of habeas corpus seeking Zuno's release.

The defense termed his continued imprisonment outrageous.

Attorney Edward Medvene suggested the government was using the INS proceeding as a subterfuge to hold Zuno in the United States.

Zuno was charged with lying when he said he didn't know two Mexican drug kingpins tied to the 1985 Camarena murder.

Meanwhile, Schiff disclosed in court that Zuno allegedly was involved in the murder of two Mexican policemen in 1978.

However, Zuno's lawyers told Takasugi that their client did not shoot anyone and was never charged.

Medvene said the incident occurred after Zuno's father, then the governor of Jalisco, Mex., was kidnapped.

Way Cleared for Zuno to Return to Mexico

A **Los Angeles** federal judge Tuesday cleared the way for Mexican businessman Ruben Zuno Arce, who faces perjury charges in connection with the murder of a U.S. drug agent, to return to Mexico.

U.S. District Judge Robert M. Takasugi accepted offers by Zuno's lawyers of property and cash to secure $200,000 bail and ordered Zuno's release at 10 a.m. today after Assistant U.S. Atty. Adam Schiff signs off on two pieces of property offered as security.

Unless an unexpected problem arises, Zuno, 59, will be released from the Metropolitan Detention Center, where he has been held since Aug. 9, and placed on a flight to Mexico.

The arrangement for Zuno's departure was approved last week by Immigration Judge Lauren R. Mathon after the INS modified a "hold" placed on Zuno that labeled him a suspected drug trafficker.

"The immigration service will take him to LAX and place him on the next available flight to the interior of Mexico," said INS District Counsel John Bartos.

Zuno, brother-in-law of former Mexican President Luis Echeverria, is due back in federal court on Nov. 7. He faces charges of lying to a grand jury when he denied knowing two drug kingpins who are in jail in Mexico pending charges in the February, 1985, murder of U.S. Drug Enforcement Administration agent Enrique Camarena.

Mexican Businessman Makes Court Date

By SCOTT HARRIS
TIMES STAFF WRITER

A prominent Mexican businessman charged with lying to a grand jury investigating the murder of U.S. drug agent Enrique Camarena defied a prosecutor's prediction Monday simply by showing up in court.

"We're pleasantly surprised," Assistant U.S. Atty. Adam Schiff said after Ruben Zuno Arce arrived as promised in U.S. District Court in Los Angeles. Schiff had earlier argued unsuccessfully against bail for Zuno, saying it was unlikely the wealthy, well-connected businessman would ever return to the United States if given the chance to leave.

During Monday's hearing, U.S. District Judge Robert M. Takasugi ordered that Zuno's perjury trial date be moved from Nov. 7 to Dec. 12 to allow time for a series of pretrial motions to be argued.

Zuno's attorneys are attempting to learn the identity of government informants. Prosecutors have been protective of their identity, Schiff said, because "a number of people" connected with the Camarena case "have ended up dead."

Zuno, the 59-year-old brother-in-law of former Mexican President Luis Echevveria, is suspected by U.S. authorities of being a drug trafficker—an allegation he denies. He was arrested by immigration officers in San Antonio on Aug. 9 and brought to Los Angeles as a material witness in the 1985 murder of Camarena.

Prosecutors say Zuno owned the Guadalajara house in which Camarena was tortured before he was murdered. Zuno was indicted by a federal grand jury on three perjury counts after he denied knowing Mexican drug lords Rafael Caro Quintero and Ernesto Fonesca Carillo. Both men are in Mexican jails pending charges in the Camarena slaying.

Zuno spent two months in federal custody before his release Oct. 11 on a $200,000 bond. Zuno's attorney, Edward Medvene, said he never doubted his client would return to face charges.

Schiff said he still considers Zuno a flight risk. "We're not at the day of trial yet," he said. "I'll believe it when I see it."

CAMARENA: Indictment

Continued from A3

the Guadalajara drug cartel.

Zuno was arrested Saturday night at Los Angeles International Airport when he arrived in the United States for a scheduled hearing on other federal charges pending against him. He and his lawyers appeared to be stunned by the new charges, but declined comment beyond the not-guilty plea.

Judge Rafeedie ordered Zuno held without bail, despite the pleas of his defense lawyer, Edward Medvene, that his client was neither a flight risk nor a threat to the community. He had been free on $200,000 bail on federal perjury charges and has twice returned to the United States from Mexico for hearings on that case.

Prosecutor Medrano asserted that Zuno might flee, that he represented a threat to witnesses who would testify at his trial and that the charges against him were of sufficient gravity to deny him bail. "The complexion of this case is night and day different from the perjury case," Medrano said.

Zuno surfaced as a potentially important figure in the Camarena case in August when immigration authorities in San Antonio arrested him as a suspected drug trafficker and brought him to Los Angeles for questioning as a material witness in the ongoing investigation into Camarena's murder. He denied any involvement in the murder.

He was held without bail for nearly two months by a variety of federal agencies, during which time he testified before a grand jury under a grant of immunity.

On Sept. 7, he was charged with perjuring himself before the grand jury on two occasions. That indictment states that Zuno lied when he denied knowing Rafael Caro Quintero and Ernesto Fonseca Carrillo. A trial on the perjury charges is scheduled to begin in January before U.S. District Judge Robert Takasugi.

Monday marked the first time that federal authorities alleged that Zuno was directly involved in Camarena's murder.

"The charges against Zuno go to the heart of this case," prosecutor Medrano told Judge Rafeedie. He noted that Zuno has been charged with plotting the murder with Caro Quintero and Fonseca Carrillo. "This man rises to that level of [drug] trafficker," Medrano asserted. At another point, Medrano asserted that Zuno had been "part and parcel of the entire planning stage" of the Camarena kidnaping and murder.

Zuno is a member of an influential Mexican family. His father was governor of the state of Jalisco, and his sister is married to Echeverria.

Zuno, his attorneys and his wife have consistently denied that he has had any involvement with drug trafficking.

Camarena was tortured in a Guadalajara house purchased by Caro Quintero in January, 1985, less than a month before the murder.

According to court documents filed in San Antonio in August, Zuno owned the home until Jan. 11, 1985, when he sold it to another man who, in turn, sold it to Caro Quintero.

In all, 16 men have been indicted in Los Angeles in connection with the Camarena murder. Three of them were convicted in a trial held before Judge Rafeedie last year. Raul Lopez Alvarez, a former homicide officer for the Mexican Federal Judicial Police, was sentenced to 240 years in prison; Rene Martin Verdugo Urquidez, a San Felipe land developer, was sentenced to 240 years and an additional life term; and Jesus Felix Gutierrez, former owner of a Los Angeles area seafood company, was sentenced to 10 years.

Eight of the remaining 13 indicted in the case are fugitives, according to prosecutors. Among them are Caro Quintero and Fonseca Carrillo. The Mexican government has refused U.S. requests to extradite them to this country.

Other defendants include Armando Pavon Reyes, a former commander of the Mexican Federal Judicial Police who originally headed the Mexican government investigation into the Camarena murder, and Sergio Espino Verdin, a police officer identified by U.S. officials as one of Camarena's interrogators. Pavon Reyes and Ines Calderone Quintero are fugitives.

Juan Jose Bernabe Ramirez, a former Mexican police officer arrested earlier this year, is scheduled to go on trial in February for his alleged role in the murder.

Camarena's pilot, Alfredo Zavala Avelar, also was kidnaped and murdered. Indictments have been lodged against some of the 16 defendants for their role in that killing, but Zuno was not named in those charges.

Later in the day Monday, Judge Takasugi denied motions filed by Zuno's lawyers that the perjury charges be dropped on grounds of prosecutorial misconduct. The lawyers also objected to the fact that a briefcase belonging to Zuno was seized when he was arrested at Los Angeles International Airport Saturday night.

They asserted that confidential materials were photocopied by government agents. Assistant U.S. Atty. Adam Schiff denied that charge.

Perjury Case Dropped Against Man Accused in Camarena Plot

By HENRY WEINSTEIN
TIMES STAFF WRITER

A federal judge in Los Angeles on Tuesday dismissed perjury charges against a prominent Mexican businessman, who still faces trial on accusations that he helped plan the 1985 murder of U.S. drug agent Enrique Camarena.

U.S. District Judge Robert M. Takasugi dismissed the government's three-count perjury indictment against Ruben Zuno Arce, 59, after a brief hearing.

Takasugi denied a request from Assistant U.S. Atty. Adam B. Schiff for more time to present witnesses who would describe Zuno's alleged motive for perjuring himself before a federal grand jury that investigated the Camarena murder here last summer.

Zuno is the brother-in-law of former Mexican President Luis Echeverria, and his father was once the governor of the Mexican state of Jalisco.

He was indicted last September for perjuring himself when he told the grand jury that he did not know either Rafael Caro Quintero or Ernesto Fonseca Carrillo, two Mexican drug kingpins who were in a Mexican jail on charges of murdering Camarena in Guadalajara in February, 1985. They subsequently were convicted and received long sentences in Mexico while separate charges stemming from the Camarena case are pending against them here.

Zuno's perjury trial was scheduled to begin Jan. 30, but prosecutors wanted to have it postponed until after his Feb. 20 trial on more serious charges. In that case, Zuno is accused of having "organized and put into operation a scheme to kidnap and murder Camarena." If convicted, he faces life in prison.

Schiff said he sought the continuance because he believed witnesses were in danger and so they would not have to come to Los Angeles to testify. Schiff also said that, if Zuno is convicted in the conspiracy case, it is likely prosecutors will not bring the perjury case to trial.

Edward M. Medvene, Zuno's chief defense counsel, was unwilling to agree to a continuance, and the judge would not grant one. Then Schiff said he had been authorized by his superiors to ask Takasugi to dismiss the perjury case without prejudice, meaning that the government could refile the charges later. Takasugi granted that motion.

Zuno's lawyers were pleased with the dismissal.

ZUNO: Perjury Case Dismissed

Continued from B9

"We believe that the government dismissal of the perjury case is a reaffirmation of what we've said since . . . they took him into custody—the government doesn't have a case," Medvene said.

"This is a very important victory for Mr. Zuno," said James J. Blancarte, one of his other defense lawyers. "Simple logic dictates if they don't have the evidence to convict him on perjury charges [that he knew Fonseca and Caro], then they don't have the evidence to convict him on charges that he conspired with Fonseca and Caro to kill Camarena."

Asked if it was possible that prosecutors had dropped the perjury charges so that they would not have to show their hand in advance of the more significant conspiracy case, Blancarte responded: "It's possible, but it stands side by side with the possibility that they don't have a case."

Medvene said that the government attempted to keep Zuno jailed to compel him "to supply information he doesn't have," a reference to the possibility that he could implicate others in Camarena's murder.

The dismissal of perjury charges will have no impact on Zuno's conspiracy trial, according to Assistant U.S. Atty. Manuel Medrano, the lead prosecutor in that case.

Zuno is the 16th person indicted in the Camarena case, a matter of the highest concern to the U.S. Drug Enforcement Administration and recently the subject of an NBC TV miniseries.

DEA agents have said there will be more indictments in the case by Feb. 7, the fifth anniversary of the murder and the last day on which charges can be filed before the federal statute of limitations runs out.

Prosecutors Deny Misconduct Charges in Miller Spy Case

By HENRY WEINSTEIN
TIMES STAFF WRITER

Justice Department lawyers have vigorously denied that they have engaged in any misconduct in prosecuting espionage charges against former FBI Agent Richard Miller.

In January, attorneys for Miller claimed in a motion filed in U.S. District Court in Los Angeles that charges against him should be dismissed because prosecutors intentionally withheld information that could benefit Miller's defense.

But in their response, prosecutors maintain that the defense motion "is wholly without merit." The defense has conveyed "a false sense of conspiracy and wrongdoing on the part of the government," according to the brief filed by Assistant U.S. Attys. Russell Hayman and Adam Schiff.

The defense motion, prosecutors contend, is "a rehashing of . . . old issues with a new face," contentions that were rejected by U.S. District Judge David Kenyon, who presided over Miller's two trials and the trial of Soviet spy Svetlana Ogorodnikova, with whom Miller had an adulterous affair in 1984.

Miller, 52, was tried on espionage charges twice, with the first trial ending in a hung jury in 1985. The next year, a jury convicted him of trading a secret FBI manual to the Soviet Union for sex, money and a Burberry trench coat. It was the first time an FBI agent had been convicted of espionage.

The conviction was overturned by the U.S. 9th Circuit Court of Appeals last April and he was released on bail last October.

Miller says he was not a spy but was attempting to revive his lackluster FBI career with an attempt to infiltrate the KGB.

Kenyon removed himself from the case and U.S. District Judge Robert M. Takasugi took over. Miller's third trial is scheduled to begin July 10.

Much of the government response deals with a July, 1989, letter sent to FBI Director William Sessions by a lawyer for former FBI Agent John Hunt. Hunt was a witness in both of Miller's earlier trials. The letter urged Sessions to investigate possible FBI misconduct in the case. The letter claimed that the FBI omitted from Hunt's investigative reports on the case information that was favorable to Miller.

"All of the issues raised by" Miller's January motion "have been aired" during the earlier trials, the prosecutors retorted. "The defense has long been aware of Mr. Hunt's view" that his report had been inaccurately summarized and "has cross-examined him on this issue in all proceedings."

The prosecutors also maintain that the FBI conducted an in-depth investigation of the case. "The fact that the FBI did not back away from a prosecution of one of its own agents is a clear testament to its objectivity and single-minded pursuit of the criminal actors," the prosecution response states.

Moreover, the prosecution motion maintains that much of the information contained in the letter from Hunt's lawyer, Lynn Sarko of Seattle, tends to incriminate Miller rather than exonerate him. And the prosecutors state that they have turned over to Miller's lawyers all relevant information that could aid his defense.

In reply, Joel Levine, one of Miller's lawyers, asserted that prosecutors have "mischaracterized many of the things we were attempting to say." He said that a number of issues were raised by the July, 1989, letter that the prosecutors did not deal with in their response.

Levine and his co-counsel, Stanley I. Greenberg, said they plan to file a detailed written reply and hope that Judge Takasugi will grant a hearing so that the issues they have raised can be further explored before Miller's trial. Takasugi is scheduled to hear the misconduct motion on June 11.

2 Indicted in Hauling of Toxic Waste to Mexico

■ **Environment:** Charges are the first under a federal law involving smuggling of hazardous material.

By MAURA DOLAN
and LARRY B. STAMMER
TIMES ENVIRONMENTAL WRITERS

Federal, state and Los Angeles County law enforcement officials announced Thursday the first federal felony indictment under an environmental law in a case involving the smuggling of toxic wastes from California into Mexico.

Citing growing trafficking of hazardous garbage from California across the border, the officials also announced the creation of a new multi-agency task force intended to remove jurisdictional problems that have hampered such smuggling investigations in the past.

"There are a lot of types of crime that have gone global—white collar crime, terrorism and drugs, just to name a few," said William Stollhans, assistant special agent in charge of enforcing environmental laws for the FBI. "The indictment today is an example of where environmental crimes have now gone international. They know no international boundaries."

The indictment charges that Raymond Franco, 57, a licensed waste hauler from El Toro, accepted money from California businesses to take their wastes to legal landfills or recycling facilities. But instead of going to the designated sites, the indictment says, Franco and an accomplice, David Torres, 39, of Huntington Park, loaded drums of the dangerous materials into enclosed trucks destined for Mexico, concealing the barrels under cardboard and wood and surrounding them with empty drums.

Much of the dangerous material allegedly was dumped at a Tijuana warehouse owned by Torres, and investigators fear some of the barrels later may have been used by nearby residents to store water. Prosecutors said the government of Mexico cooperated fully in the inquiry.

Among the firms whose waste ended up in Tijuana was Barmet Aluminum Corp. of Torrance, which paid Franco a total of $12,000 in 1988 to haul 57 drums of hazardous material to a treatment facility and a licensed hazardous-waste landfill, according to the indictment.

Had the material actually gone to a legal landfill, the cost would have approached $28,000, more than twice as much as the firm paid Franco, investigators said. The division manager of the Torrance

TOXIC: 2 Waste Haulers Indicted

Continued from A1

facility, which was not charged, said the company trusted Franco to dispose of the material lawfully.

On Wednesday, The Times reported that increasingly strict environmental laws and the escalating costs of legal disposal are prodding more and more hazardous waste generators in Southern California to send their toxic garbage illegally into Mexico, where it is dumped or used in industrial processing.

The indictment announced Thursday marked the first time transporters of hazardous waste have been charged with illegal smuggling under the U.S. Resource and Conservation Recovery Act, which prohibits, among other things, disposing of hazardous waste without a permit.

In a similar case in 1986, three Americans were indicted by a federal grand jury in San Diego for falsifying shipping documents. That case was filed under federal mail fraud statutes.

"This is the first time that California law enforcement officers have in fact witnessed the unlawful smuggling of toxic waste into Mexico and have documented it," said William Carter, a Los Angeles County deputy district attorney who helped investigate the case. "This is just one set of players out of dozens who are out there operating in similar fashion. We just have to take them one set at a time."

In a separate case stemming from the Franco investigation, the federal grand jury also indicted Laminating Co. of America, a Garden Grove firm, accusing it of conspiracy to dispose of and transport hazardous waste and 46 counts of illegal transportation and disposal of toxic waste—all within Orange County.

Rex Scatena, an attorney for Laminating, said the company is "an old, family-run business." He said he had not yet seen the indictment, but he defended the firm.

"They have all the necessary permits to dispose of and handle the materials they use there," Scatena said.

Franco, who authorities said disappeared from his Orange County home a year ago, was arrested in New York on Wednesday. He was arraigned before a federal magistrate in Brooklyn on Thursday and was held pending a bail hearing today. Authorities said they were planning to summon Torres to appear before a federal magistrate in Los Angeles. Torres is believed to be cooperating with investigators.

Franco and Torres could not be reached for comment, but a woman who identified herself as Franco's wife said her husband is innocent.

Reached by telephone at the couple's El Toro home, the sobbing woman said, "He did nothing wrong. . . . He is a good person."

Franco was charged with one count of conspiracy, seven counts of illegal transportation and disposal of hazardous waste and one count of illegal export of hazardous waste to Mexico. Torres was charged with one count of conspiracy, six counts of illegal transportation and disposal of hazardous waste and one count of illegal export of hazardous waste to Mexico.

If convicted, Franco faces a maximum sentence of 32 years in prison and a fine of $250,000 on each count. Torres faces a maximum of 27 years in custody, and a fine of $250,000 for each count.

Investigators said they placed Franco under surveillance in 1988 after he was identified as a possible suspect during routine monitoring by county health department officials of local waste generating companies.

While under surveillance in October, 1988, Franco and Torres met at Laminating Co. of America in Garden Grove and loaded 16 drums of hazardous waste onto two trucks. Torres headed north in his truck but investigators lost track of him before he made any stops.

The other truck, driven by a Mexican national, headed to the border, investigators said. The CHP stopped the vehicle before it reached the border and the driver was arrested and subsequently prosecuted by Orange County authorities for illegally transporting hazardous waste, according to Los Angeles County investigators. The man served jail time and eventually returned to Mexico.

As undercover investigators continued to watch Franco, prosecutors said, they saw repeated illegal activities at Laminating Co. According to the indictment, the firm's employees were seen on several occasions illegally disposing of hazardous wastes in trash bins destined for a municipal landfill in the city of Orange. Franco also was seen dumping hazardous materials into an ordinary trash bin.

The waste, eventually picked up by the municipal garbage company and taken to Santiago Landfill, should have been put into special containers and taken to a licensed hazardous waste facility.

In the meantime, Barmet Aluminum Corp. notified the U.S. Environmental Protection Agency that hazardous waste facilities where Franco and Torres were supposed to have taken Barmet's materials had not, in fact, received them. The corporation, based in Ohio, has aluminum recycling plants across the nation.

"The guy [Franco] did something wrong," said Jorge Eulloqui, division manager of the corporation's Torrance facility. "We trusted him, we hired him under good conscience and he defrauded our company."

Eulloqui, who said his plant budgets about $50,000 a year for the treatment, recycling and disposal of hazardous waste, said the company employee who contracted with Franco is no longer with the firm. Eulloqui said he does not believe that the former employee suspected anything was amiss even though the fees paid to Franco were unusually low for legal disposal.

Los Angeles County and federal prosecutors, who announced the filing of the indictments at a news conference in Los Angeles, said they hope they will deter illegal dumping in the future.

"Companies realize it's cheaper to pollute than to dispose of hazardous material properly," said Assistant U.S. Atty. Adam B. Schiff, who is helping to prosecute the cases. "We hope the announcement of the indictments and the task force will impress individuals that the calculus is changing dramatically, that the costs are going up dramatically."

The new environmental task force will include representatives of the FBI, the EPA, the U.S. Department of Transportation, the California Highway Patrol and the California Department of Health Services.

Officials said halting waste trafficking into Mexico will be a top priority of the task force, which will have jurisdiction over much of Southern California. Previously, law enforcement investigators told The Times that little was being done to stop toxic waste smugglers because of jurisdictional problems and lack of adequate staffing.

"We have to be as diligent at the border in stopping those poisons that are going south as we are in trying to stop the drugs that are coming north," said Los Angeles County Dist. Atty. Ira Reiner.

Reiner said crops imported from Mexico may be contaminated by toxic ground water and poisons that have been dumped in Mexican rivers.

State officials also have worried that toxic waste dumped by Americans in Mexico is contributing to contamination in California. An internal state government memo obtained Thursday by The Times warned a year ago that the illegal disposal of hazardous waste in Mexico posed ground water contamination and air pollution threats not only to Mexico, but also to the United States.

The May 30, 1989, memo to state Health Director Kenneth W. Kizer said the potential for environmental problems "appears to be extreme," both from the illicit trafficking of hazardous waste into Mexico, and from waste generated in Mexico by American-owned factories along the border.

Times staff writer Catherine Gewertz in Orange County contributed to this story.

Miller Loses Bid to Keep Confession Out of New Trial

■ **Spy case:** Former FBI agent says he admitted passing manual to Soviets in order to please his interrogators. 'I did not give anybody any documents,' he says.

By GEORGE RAMOS
TIMES STAFF WRITER

On the eve of his third trial for spying, former FBI agent Richard W. Miller testified Tuesday during a pretrial hearing that he confessed to passing a secret bureau manual to the Soviet Union because he was trying hard to please the fellow agents who were interrogating him.

The five intense days of questioning in the fall of 1984—including talks with two FBI superiors who were members of the Mormon Church, as Miller was—confused issues in his mind and prompted him to confess when, in fact, he had not done anything wrong, he said.

"I want to be so honest that the statements I made were of benefit to the FBI . . . even to the side of error," Miller testified. "I had talked myself into believing that I had [passed secrets to the Soviets]. I thought I was helping out my government."

Some eight months later, Miller said he realized, as he reviewed evidence in preparation for his first trial, that he was innocent.

BILL ROBLES / For The Times

Attorney Stanley Greenberg, with Joel Levine, center, speaks at hearing for Richard Miller, left.

MILLER: Ex-Agent's Trial Starts Today

Continued from B1

"I've told the truth and I always have," he said. "I did not give anybody any documents."

Miller, 53, made his comments to support pretrial defense motions to throw out the 1984 confessions he made to FBI agents. His federal court trial begins today in Los Angeles.

But U.S. District Judge Robert M. Takasugi, who will preside over the trial without a jury, ruled that the confessions can be admitted.

Miller's attorneys, Joel Levine and Stanley Greenberg, had contended that his confession—that he passed the manual to former lover Svetlana Ogorodnikova in exchange for sex, money and an expensive trench coat—should be kept out of this trial because federal prosecutors in the past withheld certain evidence from the defense and U.S. District Judge David V. Kenyon, who presided over the first two trials.

Levine and Greenberg, however, said they would still make prosecutorial misconduct part of their strategy.

An example of that alleged misconduct, they argued, was the prosecution's failure to disclose that at the time he was being grilled by interrogators, Miller, who had been excommunicated from the Church of Jesus Christ of Latter-day Saints for sexual impropriety, had sought the "blessing" of both Richard T. Bretzing, who was head of the FBI's Los Angeles office at the time, and Phillip Christenson, a ranking agent in the office.

The defense lawyers argued that Miller's request should have been disclosed to the defense and to Kenyon during the earlier trials. This has added significance, they said, because Bretzing and Christenson were both bishops of the Mormon Church at the time, and that played a role in Miller confessing to passing the secret FBI handbook.

Assistant U.S. Atty. Adam Schiff, the current prosecutor, countered that recent decisions have allowed confessions to stand despite so-called "religious" issues. He argued that Miller had confessed without discussion from anyone about his religious life.

Christenson was brought into court Tuesday to testify about the incident, and confirmed that Miller, in the midst of tense interrogation by FBI agents, at one point asked for a blessing from him.

"There was a short pause and [Miller] said, 'No, that wouldn't be appropriate,'" Christenson testified.

Miller said he asked for the blessing in part because he looked upon Christenson and Bretzing as spiritual advisers.

Miller's first trial ended in a hung jury in November, 1985. The following year, a Los Angeles federal court jury convicted him, but the conviction was overturned by a three-judge panel of the U.S. 9th Circuit Court of Appeals in April, 1989.

He was released on bail last October after 5½ years in prison and has been working as a private investigator in Manhattan Beach.

Miller has continued to maintain his innocence, admitting in the past that he had an affair with Ogorodnikova to infiltrate the Soviet KGB and to revive his declining career with the FBI.

At one point, his attorneys likened Miller to Ralph Kramden, the well intentioned but blundering bus driver portrayed by Jackie Gleason on the old "Honeymooners" TV show.

With opening statements scheduled to start today, Miller's third trial will be different from the first two in several aspects:

- In addition to a new judge, there is a new prosecuting team. Schiff is the new lead prosecutor. Former U.S. Atty. Robert Bonner, recently confirmed as the head of the Drug Enforcement Administration, and Assistant U.S. Atty. Russell Haymen handled the first two trials.
- The case is being heard without a jury. On the advice of his lawyers, Miller reluctantly agreed to have Takasugi decided the case.
- The trial is expected to last about two months, much shorter than the six-month marathon trials before Kenyon.
- With Miller testifying on the pretrial motions, his lawyers said he may testify on his behalf in this trial. Miller did not take the witness stand in the first two.

BACKGROUND

■ Richard W. Miller, 53, is the first FBI agent to be accused of spying for the Soviet Union. He was arrested in October, 1984, on suspicion of giving a secret FBI manual to Soviet emigre Svetlana Ogorodnikova during an adulterous affair he had with her that year. An FBI agent since 1964, his career had been on the decline before his arrest over job performance and weight problems.

Miller, His Freedom Waning, Proclaims Innocence

By RONALD L. SOBLE
TIMES STAFF WRITER

Richard W. Miller says he tends "to eat more" when under stress, and these days the former Los Angeles FBI agent is under considerable stress.

Miller, 53, was convicted by U.S. District Judge Robert M. Takasugi on Tuesday of espionage—the first FBI agent ever found guilty of spying. His sentencing is set for Jan. 7, and he faces a maximum sentence of two life prison terms plus 50 years.

Until he learns his sentence, "R.W.," as his family calls him, expects to experience the gnawing anxiety which, he said, partially explains why about 300 pounds now hang on his 5-foot, 10½-inch frame.

"I have three months of freedom," he said. "What happens after Jan. 7, I don't know."

Miller's girth belies his personality. He appears more teddy than grizzly. In an interview this week, he betrayed a shyness, a tentativeness, in talking to a reporter. Some of this he attributed to a diagnosed hearing problem.

"It is in such situations as this, that it really clicks in," he said.

The verdict in the nonjury trial was Miller's second conviction for espionage (the first conviction was overturned by a federal appellate panel) and his third trial (the first, in 1984, ended with a hung jury).

In the interview, Miller again proclaimed his innocence.

"I was absolutely not a spy," Miller said quietly. "I never was. I never will be."

Miller served five years in prison before he was given a new trial; it's been about a year since he posted bail and walked out of a Minnesota penitentiary. Since then, he's assisted a private detective, helped set type for a weekly newspaper and honed his skills as an artist, cartoonist and poet.

Miller was interviewed in the small, comfortable Downey home of his sister, Maryann Deem, who sat beside him on a sofa. He spoke of the uncertainty that has pervaded his life since he was first accused,

Please see MILLER, B14

MILLER: Ex-FBI Man Waits Anxiously

Continued from B1

and he seemed haunted by his adulterous affair with convicted Soviet spy Svetlana Ogorodnikova—to whom, the government successfully argued, Miller passed secret documents in exchange for the promise of $65,000.

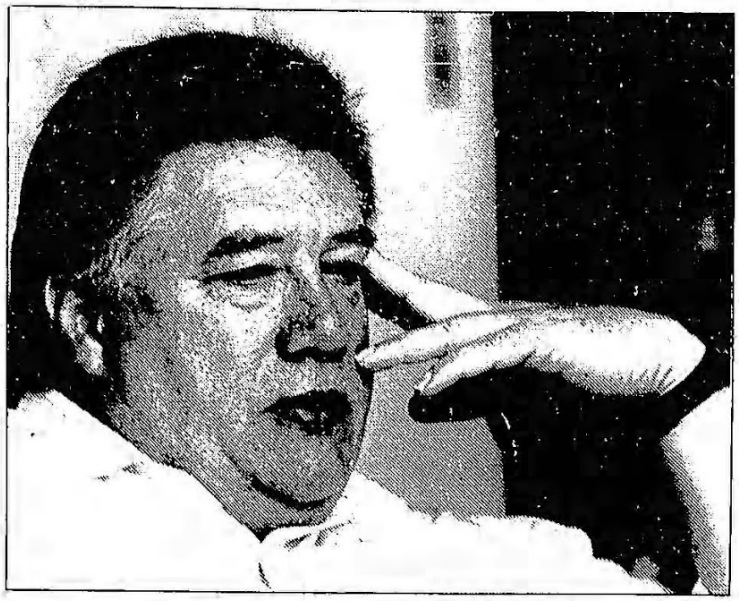
He called the affair with Ogorodnikova, now serving an 18-year prison sentence, a "dumb" thing to do and added, "It seems to get dumber as I go through the court system."

Nonetheless, Miller said he believes a handful of FBI bureaucrats "without scruples" came down on him with a vengeance.

"They know who they are," he said. "I'm not going to name names."

Then Miller's bespectacled face lit up. "I am a very fortunate fellow," he said. "I have so many blessings I can't count them."

Miller explained that he was primarily referring to the fact that Takasugi, over the prosecution's objections, let him remain free on $337,000 bail until his sentencing so he could enjoy the holiday season



ANACLETO RAPPING / Los Angeles Times

Richard W. Miller, looking forward to three more months of freedom, maintains "I was absolutely not a spy. I never was. I never will be."

with his family.

Conscious of a weight problem that got him into serious trouble at the FBI, Miller said he has been riding a bicycle daily and even cycled on occasion about 12 miles to the federal courthouse in downtown Los Angeles during his trial.

But Albert Sayers, a retired FBI agent who hired Miller last year to work at his Manhattan Beach-based detective agency, said Miller sees food as an antidote for stress.

"When he's stressed, he eats," Sayers, the case investigator for Miller's lawyer, said recently. "He'll go out and buy a gallon of ice cream and eat it at one sitting."

In prison, at the Federal Medical Center in Rochester, Minn., Miller developed calligraphy skills. He proudly displayed for his visitor a series of greeting cards he produced for fellow inmates.

"Dearest Becky," began a Miller-designed birthday card, "We have loved, we have cried, we have laughed, we have sighed. And it's nice to recall in the Spring or the Fall, all the times we did share, all the times we did care. . . ."

Miller also is fascinated by cartoon characters. The stars of his comic strip closely resemble the ubiquitous Kilroy character of World War II vintage.

Miller also developed considerable computer skills while in prison. So far, it has allowed him to hold a part-time $8-an-hour job on a weekly newspaper, the Los Angeles Downtown News, where he used a computer to lay out ads.

The newspaper's publisher, Sue Laris-Eastin, said she didn't know when Miller was hired six months ago that "this was the R.W. Miller of this case." Then, one morning before his trial started, Miller asked for a private meeting.

"He told me he was going on trial and that he wanted to keep his job," Laris-Eastin said. "I told him it wasn't my place to decide his innocence or guilt."

So Miller stayed on the job, often being dropped off by Levine at the paper's 1st Street office after his daily court appearance during the seven-week trial.

Laris-Eastin likes Miller's work. "He's very accurate with what he does," she said.

Sayers, one of Miller's former FBI supervisors, made clear he loves Miller like a brother and believes he's absolutely innocent. And Sayers, too, said Miller performed well on the job. "The FBI doesn't hire dummies," Sayers said.

Miller's downfall, Sayers suggested, stemmed from a serious personality defect—naivete.

"He could fall in a barrel of lollipops and come up sucking his thumb," Sayers said.

Sayers described Miller as "a kind of peculiar personality . . . a kind of a loner," Sayers said.

Miller was even uncomfortable carrying a revolver, added Sayers, a former FBI weapons instructor.

"He wouldn't harm a fly," he said. "He hated to carry that gun."

His personality also played a role in Miller's defense. His attorney, Joel Levine, painted a picture of a bumbling agent who, more often than not, tripped over his own feet.

Levine told the court that once, while stationed at the FBI's Riverside office, Miller "even went so far as to be the last one out of the office at night and he left the keys to the office in the door when he left. And when we hear something like that, it doesn't sound like somebody who's an FBI agent."

So it follows, according to Levine's closing argument, that Miller finally got in "over his head" when his James Bond-style mission to use Ogorodnikova to penetrate the KGB backfired.

The government prosecutor, Assistant U.S. Atty. Adam B. Schiff, said the "bumbling agent" theory is his "pet peeve."

"The defense has been pretty successful in packaging Miller in a certain way," Schiff said in an interview after the verdict. But the portrait that emerged from testimony of his fellow agents, he said, was of a capable individual who allowed personal problems to take control of his professional life.

This was a reference to the fact that Miller, a divorced father of eight children, was being hounded with financial and domestic problems, had been the target of disciplinary action for not conforming to the FBI's weight standards and had been excommunicated from the Mormon church for adultery.

Moreover, Miller's dilemma went beyond personal crises, Schiff said.

"Miller had no plan of infiltrating anything," he said. "He was an intelligent, conniving individual who chose to go down in flames because the prospects offered by Svetlana far outweighed the prospects of serving his country."

Miller is a Wilmington native who was recruited by the FBI shortly after graduating from Brigham Young University in Utah. His children, ages 8 to 24 years, live with his ex-wife, who has remarried and resides in Utah.

Miller expressed regret over his dealings with Ogorodnikova. He said he had somehow got it into his head that he could emulate James Bond and single-handedly penetrate Soviet intelligence.

"In the movies it works; in real life it doesn't," he said.

- Eve Schiff was born Eve Sanderson on December 12, 1962 in Burbank, California. She graduated from Torrey Pines High School, San Diego in 1980.
- Eve's mother, Marion Sanderson, was an artist. She passed away in the mid '00s
- Eve studied at the University of California, Santa Barbara. Her major and chosen career are, however, unknown.
- Eve and Adam Schiff Married in 1995
- 1990 was an eventful year in Schiff's career. That year, he had risen to prominence as the prosecutor who secured the first espionage conviction against an FBI agent in the infamous Richard Miller case. That was also the year he met his future wife.
- His friends had arranged a doubles match at a Marina Del Rey tennis court one day in 1990. One of the participants was Eve Sanderson.

Mother - Marion Sanderson

1985 (Jan 17) - Marion Sanderson - artists page

Marion Sanderson

She has exhibited widely in San Francisco and San Diego.

Marion Sanderson came to Del Mar by way of Michigan, where she was raised, and art schools in Chicago, Paris and New York City.

"I was a commercial artist for several years," Sanderson said, "because I felt that I drew better than I painted. But it didn't satisfy me. And I couldn't do both. After working, I didn't have the energy or enthusiasm to paint. So I gave up commercial work."

Although these seven artists represent only a segment of the teeming art scene, their differing works offer a look at art today.

The Felicita Foundation for the Arts will show "Art Today" Friday through March 4 at the Mathes Cultural Center in Escondido. The center, at 3rd Avenue and Kalmia, is open from 10 a.m. to 4 p.m. Monday through Saturday with no admission charge. For more information, call 743-3322.

Battle Creek Enquirer (Battle Creek, Michigan) · 29 Mar 1945,

Ruth Champlin Bride Of Sergt. Sanderson

Miss Ruth Champlin, daughter of Mrs. John Minnick of 48 North Union, became the bride of Staff Sergt. James D. Sanderson, son of Mrs. Alice Sanderson of Big Rapids and of Wilber Sanderson of Grand Rapids, at 4 o'clock Tuesday afternoon at Mr. and Mrs. Minnick's home. The Rev. John Clemens of the Maple Methodist church performed the ceremony.

Miss Marjorie Noble and Roy Champlin, brother of the bride, attended the couple.

The bride wore an afternoon dress of aqua crepe and a corsage of gardenias and red roses. Miss Noble's frock was yellow and her corsage of blue iris.

Out-of-town guests at the wedding were Mr. and Mrs. Wilber Sanderson of Grand Rapids, Mrs. Alice Sanderson of Big Rapids, Miss Frances Curle of Albion and Miss Barbara Shannon and Miss Jane Clark of Kalamazoo.

The couple left after the ceremony for a brief honeymoon in Chicago. Young Mrs. Sanderson will accompany her husband to his new station.

Mrs. Sanderson is a 1943 graduate of Central high school and attended Western Michigan college. Sergeant Sanderson also attended Western Michigan college and entered the marine corps more than a year ago.

Readers feel bond to 'Liberated Male'

Reader response was immediate and enthusiastic to our Aug. 9 tryout of Jim Sanderson's "The Liberated Male."

Scores of letters brought messages of agreement with the veteran journalist's aversion to TV's "assault" on viewers with commercials for feminine hygiene products.

The message, too, was "Give us more Sanderson."

So, starting now, we'll be running his column regularly on Living Today pages. To let readers get to know "The Liberated Male," it will run twice a week, in Thursday and Sunday editions. In a month or so, we'll switch to once-a-week, Sunday.

Subjects you can expect "The Liberated Male" to write on are "Having a Baby is Dad's Business, Too;" "Tears for a Man—Yes, They Are Allowed;" "Men's Lib Group Rejects Idea They Oppress Women;" "To Make a Man Happy Just Ogle His Body;" and "Getting Together—Learning to Grow;"

And in case you're wondering, "Who is this fellow Sanderson?", here's what we know:

—James Dean Sanderson, reared in Muskegon, Mich., ended World War II as a Marine Corps 2nd Lt. attached to Naval Intelligence. He was the youngest officer ever commissioned by the Corps.

Jim Sanderson

—After graduation from Medill School of Journalism at Northwestern University, he went to work for Salt Lake Tribune and, later, for Stars and Stripes as a reporter and copy editor.

—He broke into TV as a stringer for NBC News in the Mideast and Africa. He went on to write and produce his own film documentaries on the Iron Curtain, which were distributed worldwide by the U.S. Information Agency.

—He has written scripts for radio, TV and motion pictures and his reporting and social commentary have appeared in every major magazine in the United States and dozens of foreign publications.

—Among his published books are novels on such themes as the U.S. presidential campaign and the Hungarian revolution.

Frank T. Page

January 1, 1918 - March 20, 2016

Frank T. PageFrank T. Page Jr., 98, of Palm City, FL, passed away peacefully on Sunday, March 20, 2016 in his home at Sandhill Cove Retirement Living.

Born in 1918 in Pittsburgh, PA, he graduated from Central Catholic High School and from the University of Illinois where he was a member of the Kappa Sigma Epsilon fraternity.

During World War II Frank served in the US Army Air Corps attaining the rank of Captain. He was involved in public relations during his army career and managed the Santa Ana Army Air Force Baseball Team working with illustrious professional players including Joe DiMaggio.

Frank started his career in the oil industry with the Mobil Oil Company in North Carolina and later moved with Mobil to Chicago, Illinois. It was there that he met his wife, Catherine "Kay" Kroth. They were married in Paw Paw, Michigan in 1948. He joined The Phillips Petroleum Company in Bartlesville, Oklahoma in 1948. In 1950 he was promoted to Phillips' International Office in New York City where he became a manager and later director. Frank loved the vibrancy of New York City and his work allowed him to travel extensively worldwide, mainly to the Middle East, Europe, Asia and South America. He continued to work there until his retirement in 1977. He was a lifelong, avid golfer and was a member of Morris County Golf Club in Convent Station, NJ for over 60 years. In 2005, Frank and Kay moved from their home in Summit, NJ to Palm City, FL.

Frank and Kay Page were members of St. Teresa Catholic Church in Summit, New Jersey and then Holy Redeemer Catholic Church in Palm City.

Survivors include his son, Dr. Robert Page, MD and his wife Yan Gao, MD of Knoxville, TN; his daughters, Anne Page and her husband Robert Mercer of Mystic, CT; Elizabeth Van Wagener and her husband Vandy of Denver, CO; Karen Page of Stuart, FL; Cindy Sonntag and her husband Randy of Jupiter, FL; and four grandchildren and two great grandchildren. He was preceded in death by his wife of 63 years, Catherine K. Page and all seven of his siblings.

Visitation will be from 9:00 to 10:00 AM on Monday, April 4, 2016 at the Forest Hills Funeral Home, Palm City, FL. A Mass of Christian Burial will be celebrated at 10:30 AM at Holy Redeemer Catholic Church. Interment will follow in Forest Hills Memorial Park with military honors provided by the Patrick Air Force Base Honor Guard.

The 59-year-old can at least count with the support of longtime wife Eve. The two have been married for nearly 25-years. The couple is known for being super supportive of each other.

Eve Schiff was born Eve Sanderson, she used to be a tennis player and was active in the game for most of her youth. In fact, it was on a tennis court in Marina del Rey back in 1990 that she met future husband, Adam.

Jr - (brother of Anna Brach) Kroth

CHICAGO TRIBUNE, THURSDAY, JANUARY 28, 1965

E. J. BRACH, 77, HEAD OF CANDY COMPANY, DIES

Edwin J. Brach, 77, chairman of the board of E. J. Brach & Sons, candy manufacturers, died yesterday at his winter home in Tucson, Ariz.

E. J. Brach

Mr. Brach, who lived at 595 Sheridan rd., Winnetka, was 17 years old when his father, the late Emil J. Brach, founded the candy firm in 1904.

Began as Corner Shop

The business started out as a corner candy shop at North avenue and Towne street, a street that no longer exists. It was known as Brach's Palace of Sweets. Edwin's job then was to sell over the counter, keep records, and cut and pack candy.

Today E. J. Brach & Sons, with general offices and its factory at 4656 Kinzie st., is one of the largest candy makers in the country.

Mr. Edwin Brach was elected a vice president of the firm when it incorporated in 1916. In 1947, after his father's death, he became president, and in 1951 was elected chairman of the board.

Known for Charity

Mr. Brach also was known for his charitable interests, including St. Anne's hospital.

Surviving are his widow, Hazel Shurtleff Brach; a daughter, Mrs. Barbara Sharpe; the brother, Frank, now president of the firm; and a sister, Mrs. Anna V. Kroth. Private services will be held in Tucson.

Chicago Tribune, Sunday, December 28, 1980 Section 3 19

Ann Brach Kroth

Mass for Ann Brach Kroth, 88, daughter of the founder of the E.J. Brach & Sons Candy Co. of Chicago, will be at 11 a.m. Tuesday at St. Mary's Church in Paw Paw, Mich. Mrs. Kroth died Thursday in Lawrenceville, N.J. She was born in Chicago but moved to Paw Paw, where she lived for 48 years. Her father, the late Emil J. Brach, founded the E.J. Brach & Sons Candy Co. in Chicago in 1904. She is survived by four daughters, Joan Lackey, Dorothy Ann O'Neill, Catherine Page, and Marian Sanderson; two sons, Robert and Thomas; 29 grandchildren; and 16 great-grandchildren.

MASTAN CO. FILES FINANCING PLAN. The Mastan Company, Incorporated, 350 Fifth Avenue, New York, filed a registration statement (File 2-19764) with the SEC on February 9th seeking registration of $5,000,000 of 5zt senior notes due 1977 and 170,000 shares of common stock, to be offered for public sale on an all or none basis through underwriters headed by F. Eberstadt & Co., 65 Broadway, New York. The public offering price (maximum 105~ per note and $12 per share*) and underwriting terms are to be supplied by amendment.

An additional 17,000 common shares will be offered to certain company employees and Michael Schimmel, former- ly senior partner of Michael Schimmel & Co., the company's auditors, at the offering price less underwriting discount.

The company (formerly The Mastan Co., Inc.) is engaged in the business of commercial and industrial finance. It makes loans for terms of up to three years secured by first or second mortgages on real estate and by liens on chattels, assignments of contracts and various other collateral; and it also provides work- ing funds to clients by advances made on a revolving basis against the security of current trade accounts receivable, inventory held for sale and other assets. The net proceeds from this financing will be added to general funds and will be available for general corporate purposes. Part of such proceeds may be used temporarily to reduce bank borrowings.

In addition to certain indebtedness, the company has outstanding 1,700,000 shares of Class B common stock, all of which are owned by Master Properties, Inc., of New York. Master Properties is 35~ owned by Nathan Schulman, board chairman and president of the company, 35-2/31 by his wife, and 2~ by Ph. Wechsler &Son, Inc

1973 (Dec. 9) - Mrs. Lenore Barr Schimmel, wife of Michael Schimmel, president of a philanthropic foundation bearing his name, died y

[HN00L2][GDrive]

Mrs. Lenore Barr Schimmel, wife of Michael Schimmel, president of a philanthropic foundation bearing his name, died yesterday at her home, 145 Central Park West. Her age was 74.

Mrs. Schimmel was a vice president of the foundation and a former president of the Hebrew Home for the Aged in Riverdale, the Bronx.

*Surviving, besides her husband, are two sons, **Stuart** and Herbert; a daughter, Mrs. Joan Fisher; three sisters, Mrs. Mae Gould, Mrs. Evelyn Gaines and Mrs. Edith Barr, and eight grandchildren.*

1977 (April 15) - NY Times - Stuart (Barr) Schimmel Weds Caroline F. Hover

[HN00L1][GDrive]

Caroline Fearey Hover, daughter of Mr. and Mrs. John Lawrence Fearey of Chestnut Hill, Philadelphia, was married yesterday to Stuart Barr Schimmel of New York. The bride is executive secretary of the Bibliographical Society of America, of which her husband is president.

Justice Arnold L. Fein of the State Supreme Court performed the ceremony at the bridegroom's home.

The bride, an alumna of the Westover School in Middlebury, Conn., and the University of Pennsylvania, received Master of Science degree in library service from Columbia University. Her father is with Hoppin Watson, a brokerage concern in Philadelphia, and her mother teaches at the Germantown Friends School.

*Mr. Schimmel is a son of Michael Schimmel of New York and the late **Lenore Barr Schimmel**. The bridegroom is an alumnus of Rensselaer Polytechnic Institute and Columbia University and until his retirement was a partner in the firm of **Michael Schimmel** and Company, C.P.A., founded by his father. He is currently a partner in Consolidated Investing Company.*

His father, a philanthropist, recently gave the Schimmel Center for the Performing Arts to Pace University and the Schimmel Auditorium to New York University. The bridegroom's first wife died. Mrs. Schimmel's previous marriage ended in divorce.

1981 (Feb 10) - michael-schimmel-accountant-philanthropist-dead-at-84

[HN00L3][GDrive]

Michael Schimmel, an accountant and philanthropist, died last Wednesday at the Kingsbrook Jewish Medical Center in Brooklyn. He was 84 years old and a resident of Manhattan.

Mr. Schimmel retired in the 1950's from the New York accounting firm bearing his name, and his sons, Stuart and Herbert, took it over. At his death, he was a partner with his sons in the Consolidated Investment Company.

He gave the Schimmel Center for the Performing Arts to Pace University and the Schimmel Auditorium to New York University at its Washington Square campus.

A graduate of N.Y.U.'s School of Commerce, he was director emeritus of the university's Alumni Federation and a former director of its Commerce Alumni Association.

SCHIMMEL--Stuart B. The Council of the Grolier Club is deeply saddened to learn of the death of fellow member and former Councilor Stuart B. Schimmel. A Grolier member since 1961, Stuart served on the Grolier Club Council from 1972 to 1986, chairing committees on Audit, Public Exhibitions, Special Functions, and Finance. Exhibitions from his personal collections of Literary Forgers and Forgeries (1961) and Collectors in Fiction (1994), and his curatorial role in shows of artwork from the New Yorker (1974), and New York in literature (1978), represent just a few of his activities in the world of books, and his knowledge and enthusiastic presence will be sorely missed. We join with his many friends and colleagues in extending heartfelt sympathy to his wife, Caroline. Eugene S. Flamm, President

- e

James Rodney Schlesinger (February 15, 1929 – March 27, 2014) was an American economist and public servant who was best known for serving as Secretary of Defense from 1973 to 1975 under Presidents Richard Nixon and Gerald Ford. Prior to becoming Secretary of Defense, he served as Chair of Atomic Energy Commission (AEC) from 1971 to 1973, and as CIA Director for a few months in 1973. He became America's first Secretary of Energy under Jimmy Carter in 1977, serving until 1979.

While Secretary of Defense, he opposed amnesty for draft resisters and pressed for development of more sophisticated nuclear weapon systems. Additionally, his support for the A-10 and the lightweight fighter program (later the F-16) helped ensure that they were carried to completion.

Early life and career[edit]

James Rodney Schlesinger was born in New York City, the son of Jewish parents, Rhea Lillian (née Rogen) and Julius Schlesinger.[3] His mother was a Lithuanian emigrant from what was then part of the Russian Empire and his father's family was from Austria. He converted to Lutheranism in his early twenties. **Schlesinger was educated at the Horace Mann School** and Harvard University, where he earned a B.A. (1950), M.A. (1952), and Ph.D. (1956) in economics. **Between 1955 and 1963 he taught economics at the University of Virginia** and in 1960 published *The Political Economy of National Security*. **In 1963, he moved to the RAND Corporation, where he worked until 1969**, in the later years as director of strategic studies.[4]

Nixon Administration[edit]

In 1969, Schlesinger joined the Nixon administration as assistant director of the Bureau of the Budget,[5] devoting most of his time to Defense matters. In 1971, President Nixon appointed Schlesinger a member of the Atomic Energy Commission (AEC) and designated him as chairman. Serving in this position for about a year and a half, Schlesinger instituted extensive organizational and management changes in an effort to improve the AEC's regulatory performance.

CIA Director[edit]

Schlesinger was CIA Director from February 2, 1973 to July 2, 1973.[6][7] Schlesinger was extremely unpopular with CIA staff, as he reduced CIA staff by 7%, and was considered a Nixon loyalist seeking to make the agency more obedient to Nixon.[7] He had a CCTV camera installed near his official portrait at the CIA headquarters in Langley, Va., as it was believed that vandalism of the portrait by disgruntled staff was likely.[7]

Secretary of Defense (1973–1975)[edit]

Schlesinger left the CIA to become Secretary of Defense on July 2, aged 44. As a university professor, researcher at Rand, and government official in three agencies, he had acquired an impressive resume in national security affairs.

Nuclear strategy[edit]

Then Chairman Schlesinger with Nixon in September 1971

Shortly after assuming office, Schlesinger outlined the basic objectives that would guide his administration: maintain a "strong defense establishment"; "assure the military balance so necessary to deterrence and a more enduring peace"; obtain for members of the military "the respect, dignity and support that are their due"; assume "an . . . obligation to use our citizens' resources wisely"; and "become increasingly competitive with potential adversaries.... [W]e must not be forced out of the market on land, at sea, or in the air. Eli Whitney belongs to us, not to our competitors." In particular, Schlesinger saw a need in the post-Vietnam era to restore the morale and prestige of the military services; modernize strategic doctrine and programs; step up research and development; and shore up a DoD budget that had been declining since 1968.[8]

Analyzing strategy, Schlesinger maintained that the theory and practice of the 1950s and 1960s had been overtaken by events, particularly the rise of the Soviet Union to virtual nuclear parity with the United States and the effect this development had on the concept of deterrence. Schlesinger believed that "deterrence is not a substitute for defense; defense capabilities, representing the potential for effective counteraction, are the essential condition of deterrence."[*citation needed*] He had grave doubts about the assured destruction strategy, which relied on massive nuclear attacks against an enemy's urban-industrial areas. Credible strategic nuclear deterrence, the secretary felt, depended on fulfilling several conditions: maintaining essential equivalence with the Soviet Union in force effectiveness; maintaining a highly survivable force that could be withheld or targeted against an enemy's economic base in order to deter coercive or desperation attacks against U.S. population or economic targets; establishing a fast-response force that could act to deter additional enemy attacks; and establishing a range of capabilities sufficient to convince all nations that the United States was equal to its strongest competitors.[8]

To meet these needs, Schlesinger built on existing ideas in developing a flexible response nuclear strategy, which, with the President's approval, he made public by early 1974. The United States, Schlesinger said, needed the ability, in the event of a nuclear attack, to respond so as to "limit the chances of uncontrolled escalation" and "hit meaningful targets" without causing widespread collateral damage. The nation's assured destruction force would be withheld in the hope that the enemy would not attack U.S. cities. In rejecting assured destruction, Schlesinger quoted President Nixon: "Should a President, in the event of a nuclear attack, be left with the single option of ordering the mass destruction of enemy civilians, in the face of the certainty that it would be followed by the mass slaughter of Americans?"[8]

With this approach, Schlesinger moved to a partial counterforce policy, emphasizing Soviet military targets such as ICBM missile installations, avoiding initial attacks on population centers, and minimizing unintended collateral damage. He explicitly disavowed any intention to acquire a destabilizing first-strike capability against the USSR. But he wanted "an offensive capability of such size and composition that all will perceive it as in overall balance with the strategic forces of any potential opponent."[8]

Schlesinger devoted much attention to the North Atlantic Treaty Organisation, citing the need to strengthen its conventional capabilities. He rejected the old assumption that NATO did not need a direct counter to Warsaw Pact conventional forces because it could rely on tactical and strategic nuclear weapons, noting that the approximate nuclear parity between the United States and the Soviets in the 1970s made this stand inappropriate. He rejected the argument that NATO could not afford a conventional counterweight to Warsaw Pact forces. In his discussions with NATO leaders, Schlesinger promoted the concept of burden-sharing, stressing the troubles that the United States faced in the mid-1970s because of an unfavorable balance of international payments. He urged qualitative improvements in NATO forces, including equipment standardization, and an increase in defense spending by NATO

governments of up to five percent of their gross national product.[8]

Yom Kippur War and Cyprus crisis[edit]

Secretary of Defense James Schlesinger with Chairman of The Joint Chiefs of Staff General George S. Brown and Deputy Secretary of Defense Bill Clements and Air Force Chief of Staff General David C. Jones at The White House Lawn on January 1975.

Schlesinger had an abiding interest in strategic theory, but he also had to deal with a succession of immediate crises that tested his administrative and political skills. In October 1973, three months after he took office, Arab countries launched a surprise attack on Israel and started the Yom Kippur War. A few days after the war started, with Israel not faring as well as expected militarily, the Soviets resupplying some Arab countries and the Israeli government having authorized the use and assembly of nuclear weapons,[9] the United States began an overt operation to airlift materiel to Israel. As Schlesinger explained, the initial U.S. policy to avoid direct involvement rested on the assumption that Israel would win quickly. But when it became clear that the Israelis faced more formidable military forces than anticipated, and could not meet their own resupply arrangements, the United States took up the burden. According to Henry Kissinger, with the president's authority, the directive was made to resupply Israel with the needed equipment and eliminate State Department delay. "It was alleged that the airlift was deliberately delayed as a maneuver to pressure Israel." [10] Schlesinger rejected charges that the Defense Department delayed the resupply effort to avoid irritating the Arab states and that he had had a serious disagreement over this matter with Secretary of State Henry Kissinger. Eventually the combatants agreed to a cease-fire, but not before the Soviet Union threatened to intervene on the Arab side and the United States declared a higher level worldwide alert of its forces.[8]

Another crisis flared in July 1974 within the NATO alliance when Turkish forces, concerned about the long-term lack of safety for the minority Turkish community, invaded Cyprus after the Cypriot National Guard, supported by the government of Greece, overthrew President Archbishop Makarios. When the fighting stopped, the Turks held the northern portion of country and about 40 percent of the island. Turkey's military action caused controversy in the United States, because of protests and lobbying by supporters of the Greek Cypriot side and, officially, because Turkish forces used some U.S.-supplied military equipment intended solely for NATO purposes.[8]

He felt the Turks had overstepped the bounds of legitimate NATO interests in Cyprus and suggested that the United States might have to reexamine its military aid program to Turkey. During this time, President Gerald R. Ford had succeeded Nixon after his resignation; eventually Ford and Secretary of State Henry Kissinger made it clear with two presidential vetoes that they favored continued military assistance to Turkey as a valued NATO ally, but Congress overrode both vetoes and in December 1974 prohibited such aid, which instituted an arms embargo that lasted five years.[8]

Indochina[edit]

Secretary of Defense James Schlesinger with Chairman of The Joint Chiefs of Staff General George S. Brown at The Pentagon, November 18, 1974.

The last phase of the Vietnam War occurred during Schlesinger's tenure. Although all U.S. combat forces had left South Vietnam in the spring of 1973, the United States continued to maintain a military presence in other areas of Southeast Asia. Some senators criticized Schlesinger and questioned him sharply during his confirmation hearings in June 1973 after he stated that he would recommend resumption of U.S. bombing in North Vietnam and Laos if North Vietnam launched a major offensive against South Vietnam. However, when the North Vietnamese began their 1975 Spring Offensive, the United States could do little to help the South Vietnamese, who collapsed completely as the North Vietnamese captured Saigon in late April. Schlesinger announced early in the morning of 29 April 1975 the evacuation from Saigon by helicopter of the last U.S. diplomatic, military and civilian personnel.[8]

Only one other notable event remained in the Indochina drama. In May 1975 Khmer Rouge forces boarded and captured the crew of the *Mayaguez*, an unarmed U.S.-registered freighter. The United States bombarded military and fuel installations on the Cambodian mainland while Marines landed by helicopter on an offshore island to rescue the crew. The 39 captives were retrieved, but the operation cost the lives of 41 U.S. military personnel. Nevertheless, the majority of the American people seemed to approve of the administration's decisive action.[8]

Defense budget[edit]

Schlesinger give a briefing to the press.

Unsurprisingly, given his determination to build up U.S. strategic and conventional forces, Schlesinger devoted much time and effort to the Defense budget. Even before becoming secretary, in a speech in San Francisco in September 1972, he warned that it was time "to call a halt to the self-defeating game of cutting defense outlays, this process, that seems to have become addictive, of chopping away year after year." Shortly after he took office, he complained about "the post-war follies" of Defense budget-cutting. Later he outlined the facts about the DoD budget: In real terms it had been reduced by one-third since FY 1968; it was one-eighth below the pre-Vietnam War FY 1964 budget; purchases of equipment, consumables, and R&D were down 45 percent from the wartime peak and about $10 billion in constant dollars below the prewar level; Defense now absorbed about 6 percent of the gross national product, the lowest percentage since before the Korean War; military manpower was at the lowest point since before the Korean War; and Defense spending amounted to about 17 percent of total national expenditures, the lowest since before the Pearl Harbor attack in 1941. Armed with these statistics, and alarmed by continuing Soviet weapon advances, Schlesinger became a vigorous advocate of larger DoD budgets. But he had little success. For FY 1975, Congress provided TOA of $86.1 billion, compared with $81.6 billion in FY 1974; for FY 1976, the amount was $95.6 billion, an increase of 3.4 percent, but in real terms slightly less than it had been in FY 1955.

Dismissal as Secretary of Defense[edit]

Secretary of Defense James R. Schlesinger with President Gerald R. Ford and Secretary of State Henry Kissinger during a briefing at The White House, November 1974.

Schlesinger's insistence on higher defense budgets, his disagreements within the administration and with Congress on this issue, and his differences with Secretary of State Kissinger all contributed to his dismissal from office by President Ford in November 1975. Schlesinger's legacy included the development of the close-air support aircraft the A-10 and the lightweight F-16 fighter. Kissinger strongly supported the Strategic Arms Limitation Talks process, while Schlesinger wanted assurances that arms control agreements would not put the United States in a strategic position inferior to the Soviet Union. The secretary's harsh criticism of some congressional leaders dismayed President Ford, who was more willing than Schlesinger to compromise on the Defense budget. On 2 November 1975, the president dismissed Schlesinger and made other important personnel changes. Kissinger lost his position as special assistant to the President for national security affairs but remained as secretary of state. Schlesinger left office on 19 November 1975, explaining his departure in terms of his budgetary differences with the White House.

The unreported, but important, main reason behind Schlesinger's dismissal, though, was his insubordination toward President Ford. During the *Mayaguez* incident, Ford ordered several retaliatory strikes against Cambodia. Schlesinger told Ford the first strike was carried out, but Ford later learned that Schlesinger, who disagreed with the order, had none of them carried out. According to Bob Woodward's 1999 book, *Shadow*, Ford let the incident go, but when Schlesinger committed further insubordination on other matters, Ford finally fired him. Woodward observes, "The United States had just lost a war for the first time. . . . That the president and the secretary of defense could not agree on who was in charge was appalling.. . . [This] unpublicized breakdown in the military chain of command was ... perhaps the most significant scandal of the Ford presidency." Schlesinger had also disobeyed Ford when told to send as many military aircraft as possible to evacuate South Vietnam. Schlesinger disagreed with doing so and didn't send the aircraft. Woodward says that an elected president, which Ford was not, would never have tolerated the insubordination.

In spite of the controversy surrounding both his tenure and dismissal, Schlesinger was by most accounts an able secretary of defense. A serious and perceptive thinker on nuclear strategy, he was determined that the United States not fall seriously behind the Soviet Union in conventional and nuclear forces and devoted himself to modernization of defense policies and programs. He got along well with the military leadership because he proposed to give them more resources, consulted with them regularly, and shared many of their views.[*citation needed*] Because he was a forthright speaker who could be blunt in his opinions and did not enjoy the personal rapport with legislators that prior Secretary of Defense Melvin Laird had, his relations with Congress were often strained. A majority of its members may have approved Schlesinger's strategic plans, but they kept a tight rein on the money for his programs. As for the Pentagon bureaucracy, Schlesinger generally left its management to Deputy Secretary of Defense William P. Clements.[*citation needed*]

Secretary of Energy (1977-1979)[edit]

Schlesinger while serving as Energy Secretary

Secretary of The Energy James Schlesinger with President Jimmy Carter at The Oval Office on March 23, 1977.

After leaving the Pentagon, Schlesinger wrote and spoke forcefully about national security issues, especially the Soviet threat and the need for the United States to maintain adequate defenses. When Jimmy Carter became President in January 1977 he appointed Schlesinger, a Republican, as his special adviser on energy[11] and subsequently as the first Secretary of Energy[11] in October 1977. According to one account, "Schlesinger impressed candidate Jimmy Carter with his brains, his high-level experience... and with secrets regarding the defense spending vacillations of his old boss, Ford, just in time for the presidential debates."[12]

As Energy Secretary, Schlesinger launched the Department's Carbon Dioxide Effects and Assessment Program shortly after the creation of that department in 1977. Secretary Schlesinger also oversaw the integration of the energy powers of more than 50 agencies, such as the Federal Energy Administration and the Federal Power Commission.[11] In July 1979, Carter replaced him as part of a broader Cabinet shakeup.[11] According to journalist Paul Glastris, "Carter fired Schlesinger in 1979 in part for the same reason Gerald Ford had—he was unbearably arrogant and impatient with lesser minds who disagreed with him, and hence inept at dealing with Congress."[12]

Post-government activities[edit]

Schlesinger at the Pentagon in 2004, as Chairman of the Independent Panel to Review Department of Defense Detention Operations

After leaving the Energy Department, Schlesinger resumed his writing and speaking career, including the 1994 lecture at the Waldo Family Lecture on International Relations at Old Dominion University.[13] He was employed as a senior adviser to Lehman Brothers, Kuhn, Loeb Inc., of New York City. He advised Congressman and presidential candidate Richard Gephardt in 1988.[12]

In 1995, he was the Chairman of the National Academy of Public Administration (NAPA). They wrote a report in conjunction with the National Research Council called "The Global Positioning System: Charting the Future" [14] The report advocated for the opening GPS up to the private sector.

On February 8, 2002, he appeared at a hearing before the Senate Governmental Affairs Committee in support of the creation of a commission to investigate the 9/11 attacks.[15]

On June 11, 2002 he was appointed by U.S. President George W. Bush to the Homeland Security Advisory Council. He also served as a consultant to the United States Department of Defense, and was a member of the Defense Policy Board.

In 2004, he served as chairman to the Independent Panel to Review DoD Detention Operations.[16]

On January 5, 2006, he participated in a meeting at the White House of former Secretaries of Defense and State to discuss United States foreign policy with Bush administration officials. On January 31, 2006 he was appointed by the Secretary of State to be a member of the Arms Control and Nonproliferation Advisory Board. On May 2, 2006, he was named to be a co-chairman of a Defense Science Board study on DOD Energy Strategy. He was an honorary chairman of The OSS Society.[17] He was also a Bilderberg Group attendee in 2008.[18]

In 2007, NASA Administrator Michael Griffin appointed Schlesinger to be the Chairman of the National Space-based Positioning, Navigation, and Timing (PNT) Advisory Board. The "PNT Board" is composed of recognized Global Positioning System (GPS) experts from outside the U.S. government that advise the Deputy Secretary level PNT Executive Committee in their oversight management of the GPS constellation and its governmental augmentations. [1]

On June 5, 2008, Defense Secretary Robert Gates appointed Schlesinger to head a task force to ensure the "highest levels" of control over nuclear weapons. The purpose of the review was to prevent a repeat of recent incidents where control was lost over components of nuclear weapons, and even over nuclear weapons themselves.[*citation needed*]

Schlesinger was Chairman of the Board of Trustees of The MITRE Corporation, having served on it from 1985 until his death in 2014; on the advisory board of *The National Interest*; a Director of BNFL, Inc., Peabody Energy, Sandia Corporation, Seven Seas Petroleum Company, Chairman of the Executive Committee of The Nixon Center. He was also on the Advisory Board of GeoSynFuels, LLC. Schlesinger penned a number of opinion pieces on global warming, expressing a strongly skeptical position.[*citation needed*]

Peak oil[edit]

Schlesinger raised awareness of the peak oil issue and supports facing it. In the keynote speech at a 2007 conference hosted by the Association for the Study of Peak Oil and Gas in Cork, Schlesinger said that oil industry executives now privately concede that the world faces an imminent oil production peak.[19][20] In his 2010 ASPO-USA keynote speech, Schlesinger observed that the Peak Oil debate was over.[21] He warned of political inaction as a major

hindrance, like those in Pompeii before the eruption of Mount Vesuvius.

On June 5, 2008, U.S. Secretary of Defense Robert Gates announced that he had asked Schlesinger to lead a senior-level task force to recommend improvements in the stewardship and operation of nuclear weapons, delivery vehicles and sensitive components by the US DoD following the 2007 United States Air Force nuclear weapons incident. Members of the task force came from the Defense Policy Board and the Defense Science Board.[22]

Personal life[edit]

In 1954, Schlesinger married Rachel Line Mellinger (February 27, 1930 – October 11, 1995); they had eight children: Cora (1955), Charles (1956), Ann (1958), William (1959), Emily (1961), Thomas (1964), Clara (1966) and James (1970).

Though raised in a Jewish household, Schlesinger converted to Lutheranism as an adult.[23]

Rachel Schlesinger was an accomplished violinist and board member of the Arlington Symphony. In the early 1990s, she was a leader in the fundraising effort to create a premier performing arts center on the Virginia side of the Potomac River. She died from cancer before seeing the center's completion. After her death, Dr. Schlesinger donated $1 million to have the center named in his wife's memory.[*citation needed*] The Rachel M. Schlesinger Concert Hall and Arts Center at Northern Virginia Community College, Alexandria Campus opened in September, 2001. It is an up-to-date building that features the Mary Baker Collier Theatre, the Margaret W. and Joseph L. Fisher Art Gallery, the Wachovia Forum and Seminar Room spaces. Clients of the Schlesinger Center include the Alexandria Symphony, the United States Marine Band, "The President's Own", and the U.S. Marine Chamber Orchestra, the United States Army Band, "Pershing's Own", and the U.S. Army Strings, the United States Navy Band, the New Dominion Chorale, the American Balalaika Symphony, Festivals of Music, various ethnic groups and many others.

Schlesinger worked consistently with distinction long after his government and academic experiences, serving on numerous governmental advisory boards until only weeks before his death at the age of 85.[24][25] He was buried at Ferncliff Cemetery in Springfield, Ohio.

Source : [HK005I][GDrive]

Christoph Scholtissek (born December 25, 1929 in Dortmund) is a German biochemist and virologist. He is particularly known for his fundamental work and discoveries on animal and human influenza viruses.

Life

Christoph Scholtissek studied chemistry at the University of Mainz and began - after various scientific positions at the University of Heidelberg, Madison and the University of Naples - his virological research at the Max Planck Institute for Virus Research in Tübingen with [Dr. Heinrich Werner Schäfer (born 1912)], the nestor of virology in Germany at the time. Here he dealt with the reproduction and biochemistry of the classic avian influenza virus. In 1964 he followed his colleague Rudolf Rott from Tübingen as C3 professor for biochemistry and virology at the Institute for Virology in Gießen, where he worked until his retirement in 1995. As an emeritus, he continued to research his field, was visiting professor in the Virology and Molecular Biology Department at St. Jude Children's Research Hospital in Memphis, and continues to publish on influenza viruses.

Researches

Among other things, he demonstrated that the genome of influenza viruses is segmented and that this gives the viruses the high genetic variability in new pandemics. The epidemiological importance of the domestic pig in the mixture of human, porcine and avian influenza virus strains to newly arranged viruses was largely recognized by him. The name mixing vessel for this special position of pigs in the epidemiology and genetics of influenza viruses goes back to Scholtissek. He was the first to succeed in establishing temperature-sensitive mutations to study the function of virus proteins in influenza viruses, and he described the importance of phosphorylation of the nucleoprotein during virus replication. Since the 1960s he has been working on specific inhibitors of virus replication that could be used in the treatment of influenza. Over 200 publications in scientific journals reflect his influence on modern virology of the 20th century.

By all accounts, the late Dr. Calvin W. Schwabe was ahead of his time.

Called the father of veterinary epidemiology, Dr. Schwabe recognized the relationship between animal and public health decades before the current one-health movement.

In “Veterinary Medicine and Human Health,” Dr. Schwabe’s seminal work first published in 1964, he wrote: “Veterinary medicine is the field of study concerned with the diseases and health of non-human animals. The practice of veterinary medicine is directly related to man’s well-being in a number of ways.”

An early advocate for integrating aspects of veterinary and human medicines, Dr. Schwabe is even credited with coining the phrase "one medicine," although the term's origins are still debated. Among his more noteworthy achievements is establishing a department of epidemiology at the University of California-Davis School of Veterinary Medicine, the first of its kind in any veterinary school in the world.

Dr. Schwabe also made several important scholarly contributions during his 52-year career in such fields as parasitic zoonoses, tropical health, and livestock health in pastoral societies. By the time of his retirement in 1991, he had trained hundreds of students from around the world in public animal disease control.

Ironically, Dr. Schwabe's esteemed career in epidemiology nearly didn't happen.

Roots of a legacy

Dr. Schwabe was born March 15, 1927, in Newark, N.J. After receiving his DVM degree from Auburn University in 1954, he was accepted as a doctoral student in parasitology and tropical medicine at Harvard University. He decided to also work toward a master's in public health.

In a 1991 interview with colleague Dr. Philip Kass, Dr. Schwabe recalled how he initially rebuffed an offer by professor John Gordon, chair of the Department of Epidemiology in Harvard's School of Public Health, to take an advanced epidemiology course limited to 10 select students. "I hadn't even taken his basic course. So I said, 'And, uh, well, thank you very much. But I'm here to get a Doctor of Science in parasitology. And I'm just by-the-by going to pursue the MPH,'" according to an interview transcript.

Once Dr. Schwabe's adviser explained what an honor it was to be chosen for the advanced course, he apologized to Gordon and accepted his offer. "Personally, as I say, I slipped into this involuntarily," he told Dr. Kass. Dr. Schwabe would go on to earn an MPH degree from Harvard in 1955 and his doctorate in parasitology the following year.

> *"Veterinary medicine is the field of study concerned with the diseases and health of non-human animals. The practice of veterinary medicine is directly related to man's well-being in a number of ways." - Dr. Calvin W. Schwabe*

Beginning in 1956, Dr. Schwabe spent nearly a decade on the medical and public health faculties of the American University in Lebanon. He founded a department of tropical health and a department of epidemiology and biostatistics, and developed a research program on hydatid disease and other parasitic zoonoses. By 1960, Dr. Schwabe was consulting for the World Health Organization on hydatid disease. With the agency's support, he began studying the disease among cattle societies in East Africa. From 1964-1966, he directed parasitic disease programs for the United Nations.

Around the time "Veterinary Medicine and Human Health" was published, Dr. Schwabe became convinced veterinary education was suffering from a lack of vision. In the book, he wrote: "I felt too often then that our traditional, conservative faculties were being dragged kicking-and-screaming into efforts to provide appropriate training for veterinarians in areas other than the most conventional aspects of private practice.

"My interests from then on were in deliberately and expeditiously preparing veterinary graduates not only to participate—but to assume leadership roles with respect to continually changing and often quite different needs for their contributions in different parts of the world. These interests were in trying to better integrate veterinary capabilities with relevant human needs."

In 1966, Dr. Schwabe joined the faculty at the UC-Davis veterinary school. There, he established the Department of Epidemiology and Preventive Medicine, now the Department of Medicine and Epidemiology, which he chaired, and served as a professor of epidemiology at the university's veterinary and medical schools. Notably, UC-Davis awarded the world's first doctorate in veterinary epidemiology to Dr. Peter Schantz in 1969.

Additionally, Dr. Schwabe instituted a master's program in preventive veterinary medicine that teaches the principles and strategies of mass disease control and prevention in animals.

"(The MPVM) is globally unique and has contributed to many leaders in veterinary medicine and public health, both nationally and internationally," observed Dr. Mo Salman, professor of veterinary epidemiology at Colorado State University's College of Veterinary Medicine & Biomedical Sciences.

Hardly anyone working today in the field of veterinary epidemiology has not been influenced by Dr. Schwabe. Dr. Marguerite Pappaioanou became acquainted with him while pursuing a master's in veterinary public health and doctorates at UC-Davis. She remembers Dr. Schwabe as a "masterful storyteller" who understood how veterinary medicine had improved human life throughout history.

"He saw that it was human health and well-being that was the unifying theme and cause of veterinary medicine, and his lectures and stories conveyed this in ways that no one else has repeated," said Dr. Pappaioanou, who went on to work for the Centers for Disease Control and Prevention, in academia, and for the Association of American Veterinary Medical Colleges.

"Coming out of his lectures, you really believed that you could change the world in important ways," she added.

One Health

[See **One Health**]

Dr. Schwabe was a prolific writer and authored several books on veterinary medicine as well as "Unmentionable Cuisine," his treatise on food prejudices that described foods ranging from bugs to turkey testicles. Yet, he considered "Veterinary Medicine and Human Health" to be his most important work. The book, which went through three editions, was Dr. Schwabe's attempt to synthesize diverse relationships between human and animal species within a context of veterinary activities promoting human health.

His view of veterinary medicine was expansive, and he railed against the mindset that limited veterinarians to animal life and well-being. According to Dr. Schwabe, early veterinary medicine was almost inseparable from human medicine.

"Traditional veterinary medicine," he said, "is concerned in varying degrees with problems in agriculture, biology, and public health. These have been the three natural avenues of development for veterinary medicine. Until recent years, however, progress in extension of organized veterinary interests in public health has been frustrated by 'accepted beliefs'—long held in the Western world—on the presumed biological uniqueness of man. These erroneous notions have thwarted a general appreciation of veterinary contributions to the development of a science of general medicine."

Dr. Bruce Kaplan considers Dr. Schwabe a "giant" within the [**One Health**] movement and describes "Veterinary Medicine and Human Health" as an essential explanation for incorporating veterinarians into interdisciplinary collaborations concerning public health. "That was true then and certainly critical in

today's world of emerging and re-emerging zoonotic diseases worldwide," said Dr. Kaplan, a one-health leader and primary contents editor for the One Health Initiative website.

Dr. Schwabe died June 24, 2006, at his home in Haverford, Pa., from complications of post-polio syndrome. He was 79. In recognition of Dr. Schwabe's contributions to biology and medicine, his papers and memoirs are housed at the National Library of Medicine in Bethesda, Md.

On the email discussion list ProMED, Dr. Peter Cowen, an associate professor of epidemiology, public health, and population medicine at North Carolina State University College of Veterinary Medicine, wrote the following eulogy: "Cal Schwabe was a great thinker. In addition to the gift of having extraordinary vision about his subjects, he mastered the art of thinking deeply about things. Cal devoted much of his effort to thinking about how veterinary medicine could serve society. He also examined the interface between veterinary medicine and other disciplines. His unique gift was the ability to articulate interrelationships, analogies, historical influences and potential avenues for development into a unified picture so elegant, so full of opportunity, so demanding of the best in people and the profession, that it could hardly fail to inspire.

"Cal Schwabe will be missed. His productivity, his acute evaluation and synthesis of so many topics, and his ability to spot trends and inspire must be replaced. With Cal's passing, the question of what should a veterinarian do needs new recruits to answer it."

Walter Scott Jr. (born 1931)

https://en.wikipedia.org/wiki/Walter_Scott_Jr.

Childhood friend of, and life-long businessparter, of Warren Buffet

Worked at Kiewit Corporation (previously known as **Peter Kiewit Sons' Incorporated**), for Peter D. Kiewit (born 1900) .

For KDG / Level 3 stuff , see Kiewit Diversified Group .

Saved Wikipedia - Sep 2020

[HK002N][GDrive]

Born May 21, 1931 (age 89) Omaha, Nebraska, United States

Education Colorado State University

Occupation Former CEO, Peter Kiewit Sons' Incorporated

Net worth $4.5 billion (November 2019)[1]

Children 6

Walter Scott Jr. (born May 21, 1931) is an American civil engineer, philanthropist, and former CEO of Kiewit Corporation .

Education He graduated from Colorado State University in 1953 with a bachelor's degree in civil engineering.[3]

Career

Scott was first elected to the Peter Kiewit Sons' Incorporated board in 1964. In 1979, he was elected president. When Peter Kiewit died later that same year, Scott was selected to succeed him as chairman.[*citation needed*]

He sits on the board of Berkshire Hathaway, and is a childhood friend of Warren Buffett.[1] He is also on the board of directors of Burlington Resources, Commonwealth Telephone Enterprises, Level 3 Communications Inc., MidAmerican Energy Holdings, RCN Corporation, Valmont Industries, and Peter Kiewit Sons' Inc, and is the chairman of the Open World Leadership Center at the Library of Congress.[4] He is a director of the Joslyn Art Museum, Nebraska Game and Parks Foundation, and the Omaha Development Foundation. Nationally, he is a director of the Horatio Alger Association and the National Forest Association.[*citation needed*]

Scott is chairman of Level 3 Communications.[5] The corporation is one of the firms created by the 1998 separation of the two operating divisions of Peter Kiewit Sons' Inc. Since the split-off, Scott now serves as chairman Emeritus of Peter Kiewit Sons', Inc.[*citation needed*]

Philanthropy

Scott consistently ranks among the wealthiest Americans. With his wife, Suzanne, he founded the public, non-profit Suzanne and Walter Scott Foundation which has funded the Scott Atrium & Education Center at University of Nebraska Medical Center,[6] the Scott Technology Center[7] in Omaha, and The Summit: Bechtel Family National Scout Reserve.[8]

In June 2010, when Warren Buffett appealed to him to join the Giving Pledge, he partially accepted, stating that after his death his remaining estate will go into his eponymous foundation.[9]

In 2011 he committed $10 million to the construction of Engineering II, a $70 million, 122,000 square feet (11,300 m^2) building which will house interdisciplinary energy, environment and health programs at Colorado State University.[*citation needed*]

In November 2016 it was announced Scott would be donating $53.3 million to Colorado State University School of Engineering, CSU's largest ever gift, and that the College of Engineering at CSU will be renamed the Walter Scott Jr. College of Engineering, becoming the only named college of engineering in the state of Colorado.[10]

Collector

In 1996 Scott acquired the original sales document of the Louisiana Purchase for his private collection.[11]

Honors and awards

Scott was the 1997 recipient of the Horatio Alger Award.[12]

He became an Eagle Scout in 1946 and is a recipient of the Distinguished Eagle Scout Award.[8]

Personal life

Scott's second wife Sue Scott had been a good friend of his first wife, Carolyn, who died in 1983, but did not know Walter. They married in 1987 at their place of worship, Countryside Community Church. Suzanne died in 2013.[13]

The Quiet Billionaire, A Match Made in Ogallala, Picturing Rodeo, Schmackery's, & Fire Drones

"The Quiet Billionaire"

An intimate portrait of retired construction executive and active philanthropist, billionaire Walter Scott. We learn about his passions, his philanthropic efforts impacting the lives of countless Nebraskans and his most important life lessons.

[and more ...]

July 22, 2002 article in Fortune Magazine - The Inside Story Of Level 3

Fortune magazine - [HP0035][GDrive]

It's a saga that brings together Bill Gates, Bernie Ebbers, Bill Miller--and even Warren Buffett. It travels from the Flaming Gorge Dam to the very backbone of the Internet, but mostly to downtown Omaha. And it may just be the most unexpected survival tale of the telecom era.

By Andy Serwer

(FORTUNE Magazine) – On the south side of Omaha, less than a mile west of the Missouri River, sits one of that city's leading tourist attractions: the famed Omaha zoo. Sure, there are those who will quietly snicker at the notion of Nebraska having a top-notch zoo--coastal snobs, no doubt, who think the fairest fauna are limited to the Bronx or to San Diego. But Omaha has one damn fine zoo. Trust us on that.

It wasn't until the 1970s, however, that the zoo--founded nearly a century earlier with a pair of bison on loan from Buffalo Bill--truly became a star attraction. That's when Omaha's most beneficent citizen lassoed the local business community into donating tens of millions of dollars. The same businessman, for that matter, was also a driving force behind the city's new art museum, the engineering institute, and the Nebraska game and parks foundation.

Here--and especially if you're a longtime reader of FORTUNE--you might be guessing that this citizen-philanthropist is none other than Warren Buffett, the Oracle of Omaha, the legendary investor and grand pasha of Berkshire Hathaway, who is certainly the city's (and perhaps history's) most famous businessman. But you'd be wrong. This isn't a Buffett story. (Sorry.) In fact, while locals hold Mr. Buffett in the highest regard, he is not perceived as Omaha's primary benefactor. That distinction goes to Omaha's other eminence grise--an unflappable, balding 71-year-old named Walter Scott.

Round-shouldered and with the slightest paunch, the city's first citizen has something wonderfully avuncular about him. He has a quiet dignity. As much as Buffett is sage and statesmanlike in his public appearances, Scott--who made his fortune as a construction company executive building highways, tunnels, and dams--is salt of the earth. Buffett, a close friend for decades, has a simple phrase that pretty much sums up Scott: "Walter is a builder."

Indeed, it is this image that makes Scott's other daytime role even more strange and compelling. For Omaha's civic guardian is also the protagonist in the astounding tale of telecom networking company Level 3, a modern business saga befitting Homer--an epic that ropes in not just Buffett (yes, he's in it after all) but also Bill Gates, billionaire Craig McCaw, and famed fund manager Bill Miller. In its twists and turns you'll find WorldCom's embattled ex-CEO Bernie Ebbers and Salomon Smith Barney's scandal-tainted telecom analyst Jack Grubman, once one of the hottest stars on Wall Street. At its heart is the rise and fall of the easy-money Internet, the spectacular collapse of the telecom sector--a failure that gets more colossal and dispiriting every day--and billions of dollars of losses by ordinary investors in a single, 723,000-strong city on America's Great Plains. (For more on WorldCom, see "Is There Any Way Out of the Telecom Mess?")

But more amazing, perhaps, is that plainspoken Walter Scott, as founder and chairman of Level 3, may actually have one of the few tickets out of this mess. When all is said and done, his company--and yes, here's our Homeric finale--may actually...survive. It may even be that a host of investors from the Cornhusker State, who clung faithfully to the stock as it fell from $130 to $30 to $3, will actually get back a tiny portion of their investment.

Not that this is a fairy tale. We should point out at the start that Level 3--which has seen its market cap sink from $44 billion in March 2000 to $1.3 billion today--will never return to the lofty levels of the bull market. Those heady days simply aren't coming back. But of all the so-called telecom infrastructure companies now on life support, Scott's Level 3 may actually have the best shot of breathing in the next two years.

In fact, as FORTUNE went to press, rumors were floating around that outside investors were about to make a sizable cash infusion into the company--perhaps hundreds of millions of dollars in equity. That, of course, speaks volumes in this environment. There are reasons for this unthinkable optimism--technological, management, and yes, even accounting reasons. But in the oddest twist, the biggest thing Level 3 has going for it are the shareholders who have seemingly lost everything: mostly, the good citizens of Omaha. Remarkably, perhaps even incredibly, they remain true to Walter Scott.

The local Lexus dealer. A prominent banker. The founder of a credit card company. The nephew of Warren Buffett. Each of them is out a bundle. There are hundreds, probably thousands of investors in Omaha who have suffered combined losses in Level 3 stock equal to tens of billions of dollars. "I personally know at least five people who've lost $20 million or more in this stock," says Ron Carson, head of local investment firm Carson Wealth Management.

The city feels their collective pain. Sales at Borsheim's, the high-end jewelry store that Buffett's Berkshire Hathaway owns, were down in 2001 for the first time ever, in part because locals were pinched by losses in Level 3. But the economic fallout appears to be manageable. The more significant effect may be psychological. Investing meltdowns just aren't supposed to happen in Omaha. This is a town where business leaders have impeccable ethics, and the smarts to go with them. This is a town strewn with multimillionaires and comfortable retirees. This is a town where investing is for the long haul. "There's a lot of pride in Omaha. It has a great work ethic, the Midwest work ethic you hear about," says Level 3 investor Denny Walker. To people like Walker, Level 3 wasn't so much a highflier of the bull market, it wasn't even so much a stock. It was an Omaha company--a company in a town, as locals like to remind you, that has five FORTUNE 500 names based there.

If you haven't been there, Omaha is probably different from what you imagine. It's more wooded than bare; hilly, not flat. What is likely to be close to your preconceptions, however, are the steak houses. There are loads of them in this erstwhile cattle town, everything from meccas like Piccolo Pete's and Johnny's to (sacrilege!) a couple of Outbacks. And then there's Gorat's.

Gorat's is rustic and dark, but the food is good, and not surprisingly it's a terrific value. It's Warren Buffett's favorite restaurant in town, where he has held more than a few high-powered tete-a-tetes over the years. Gorat's is the perfect place to sit down, enjoy a nice cut of beef, and ask Buffett (who, for the record, orders a T-bone and a Cherry Coke) about his dear friend Walter Scott.

While he never discusses his stock holdings, Buffett is happy to talk about Scott. And over a long, rambling conversation and a three-course, two-hour dinner, Buffett's affection for his fellow Omahan becomes clear. "A lot of people like to make simple things complex. Walter does the opposite. He has an ability to cut through what's complicated," says Buffett, picking at some cottage fries. "He is also a man who gives you his word, and that's it. He is a person of great integrity. People here have tremendous respect for him."

Buffett and Scott both work in the Kiewit Plaza building, which is high on a hill overlooking the city. Scott has been on the Berkshire board since 1988--for a time he was the company's one-man audit committee. But their ties go back even further. "I first got to know Walter when we were teenagers, really," Buffett says. "We both had a crush on the same girl, Carolyn Falk. She was the daughter of my father's [business] partner. Walter won her, and they ended up getting married." Hardly the way to kick off a lifelong friendship, but Buffett and Scott grew close over the years as their careers blossomed more or less simultaneously.

With such a longstanding relationship, Buffett must have invested in Level 3 stock, right? "I won't comment on that," he says, working on a chocolate sundae. Which means either he doesn't own any, or the amount he owns is too small to disclose in Berkshire's financial statements. Or he could own its bonds. Things could change, of course. When Berkshire Hathaway vice chairman Charlie Munger was asked at his company's annual meeting in May whether he would buy Level 3, he replied, "It's very hard to guess the future, but it's conceivable. We have a history of occasionally wading in when no one else will."

What Level 3 does isn't easy to understand, given that even the most basic explanations are laced with new-economy jargon. But here's how it works in the simplest terms: It sells broadband capacity on its spanking-new fiber-optic network. Most of Level 3's customers are big-kahuna Internet service providers (ISPs) and portals, such as AOL (its biggest customer), Microsoft, and Yahoo, which require highly advanced transmission lines to send reams of data at lightning speeds. Let's say you're an MSN customer and you live in a city where Microsoft uses Level 3's network. When you click on any Web address, the signal goes from your computer through Level 3's network to MSN servers and then back again--except for the so-called last mile, it never passes through copper wire or even a circuit switch. The passage is instant.

The technology, by most expert accounts, is impressive. It's both low-cost and easily upgradable. "The Level 3 network is considered to be better, thanks to an automated system that can add fiber capacity," says Eli Noam, a professor of finance and economics at Columbia University Business School.

But it wasn't the newfangled bells and whistles that impressed so many of Level 3's early investors. It was the founder. Says Omaha attorney Thomas F. Dowd, who hasn't sold a share even as his paper losses have exceeded $1.3 million: "Walter Scott is the reason, probably, that most Omahans put so much money in the stock."

Fiber optics is light years from where Walter Scott began his career 54 years ago, when he took a job at Peter Kiewit Sons' construction. Dutch immigrant Peter Kiewit founded the business in 1884 and began building things like the majestic ten-story Livestock Exchange Building in Omaha's meatpacking district. The company went on to construct enormous projects such as the Fort McHenry tunnel beneath Baltimore Harbor and the Flaming Gorge Dam in Utah. Kiewit also built much of the Interstate Highway System in the West. When Scott became CEO in 1979, the company was generating tremendous amounts of cash, as it still is today. That helped account for the bountiful rise in Kiewit's privately held stock, which was bought by younger employees at less than book value and sold by retiring employees back to the company, also at less than book.

Kiewit always generated more cash than it could use, so the company was forced to invest outside the construction business. Over the years, Kiewit bought into coal mines, toll roads, and cable TV, but in the 1980s the company began to focus its investments on the telecommunications business. At the fore of this move was Jim Crowe, who came to Kiewit from Morrison Knudsen before that giant construction company famously went bust.

Though a man blessed with serious brainpower, an intense vision, and a physical presence to match, Crowe, who is Level 3's CEO, is not as beloved as Scott is in Omaha. Detractors whisper that unlike Scott he is a bit of a spendthrift, and likes to collect fancy houses--he's got them in Idaho, Arizona, and Colorado. Still, he commands respect. When you meet Crowe you aren't surprised to learn that his father, Henry Crowe, was a highly decorated World War II Marine Corps major. Jim Crowe didn't go into the service himself, but he does have a military bearing.

At Crowe's urging, Kiewit bought a company called Metropolitan Fiber Systems, which built circuit-switch and fiber-optic networks for phone companies. By 1987, the company was renamed MFS and was building its own networks. It quickly became one of the nation's biggest CLECs, or competitive local-exchange carriers. Then, in 1993, MFS was spun out of Kiewit and taken public, a move that greatly boosted the net worth of Kiewitites who had bought into MFS before its public offering. That was the first time many Omaha investors got rich off a Scott venture.

The good times were just starting. The Internet was about to raise the financial stakes exponentially.

Every two years a group of about 50 Buffett intimates, including Scott and Bill Gates, gather at a venue for an informal multiday potlatch. In 1995 the location was Ireland's K Club, a splendid estate turned into a hotel and golf course. Gates gave a talk about how the Internet would be a revolutionary force and how he was repositioning Microsoft to meet that challenge. He also mentioned that the Net could destroy the businesses of traditional phone companies. That got Scott's attention. "Yes, Bill's talk is probably what got us thinking about the Internet," acknowledges Scott.

Scott and Crowe concluded that they should find a business that played off the infrastructure of the Net and wed it to MFS. The most attractive buy was an "Internet backbone" company named UUNet, then headed by John Sidgmore (who's now CEO of WorldCom). In April 1996, MFS bought UUNet for $2 billion, a record price for an Internet company. Meanwhile, down in Mississippi, WorldCom CEO Bernie Ebbers must have watched mushrooming MFS with some alarm. MFS looked to be a step ahead of his burgeoning empire. Ebbers had a solution: Buy MFS! In late August he offered an astonishing $14 billion of WorldCom stock for MFS.

The buyout was a boon for hundreds of longstanding Kiewit employees. "People made a bunch of money on MFS," says Omaha investor Ron Carson. "That set the stage for people buying Level 3. It reinforced the idea that Kiewit never misses. But people began to think about it like you could get rich overnight."

Scott put Crowe in charge of what was called Kiewit Diversified Services--basically all of Kiewit's businesses and investments in companies other than construction. Crowe hatched a plan to build a new company like MFS from the ground up--but this time it would construct a long-haul fiber-optic-only network based on Internet protocol. He rehired 18 of his former key MFS lieutenants from WorldCom and got to work.

Kiewit's privately held class C shares, which tracked its construction business and made so many of its employees rich, could be owned only by Kiewit employees. (Sources say that the annual compound appreciation of C shares has been more than 20% over the years.) In 1992 the company issued class D shares that tracked its diversified business. ('C' for construction. 'D' for diversified.) D shares were thinly traded, but they could be owned by non-Kiewitites. Knowing someone in Omaha was the best way to get your hands on some.

Scott and Crowe agreed that, as with MFS, it made sense to separate Kiewit Diversified Services from the construction company. For the new company, they chose the name Level 3, which refers to the seven-layer Open Systems Interconnect network model. The point was that Level 3 would focus on the bottom three levels: the first being the physical layer of fiber itself; the second, the optical layer, or the signal; and the third layer, the Internet Protocol, which in a sense is the language by which the signal is sent. Despite the mysterious name (or perhaps because of it!), "there was a tremendous amount of buzz in Omaha about Level 3," says a local businessman. "You'd hear about a block of stock for sale and then it would be sold, like that."

One person who got in early was Buffett's nephew Tom Rogers. Rogers, a local venture capitalist who works out of a renovated office in an old building in downtown Omaha, bought the stock before it was publicly traded on Nasdaq. "I remember the lady who cuts my hair asking me about the stock," recalls Rogers, who says he still owns "truckloads" of shares. "I paid my personal trainer in Level 3 shares instead of cash. I really wanted him to own this stock," he says.

On April Fool's Day 1998, Level 3 began trading on Nasdaq. The company sold a few nontelco businesses to raise more cash, but it hung on to the coal mines and a toll road for cash flow. Meanwhile, Craig McCaw's Internext venture jumpstarted the company by buying $700 million of network capacity. By the following year Level 3's stock was soaring.

It didn't hurt, of course, that Salomon Smith Barney's superstar telco analyst Jack Grubman began coverage of Level 3 with an outperform rating. In his first full report, Grubman wrote glowingly, "Level 3 is a great play on bandwidth...[which] will be chronically scarce. Capacity actually creates demand in this

business...bandwidth-centric names are good values at any price since nobody can predict the true demand caused by growth." Grubman even offered a homespun analogy about Level 3's limitless prospects: "Like the attic of a house gets filled, no matter how much bandwidth is available, it will get used."

Still, for all the enthusiasm on Wall Street, Level 3's hardiest fans were right back home in Omaha. Roger Bendet, the general manager of Lexus of Omaha on the city's western edge (which is out near Boys Town, of Spencer Tracy and Mickey Rooney fame), didn't hesitate to jump in. Neither did Denny Walker, founder of Memberworks, a company that processes credit cards. "I first got in at about $10, when it was a Kiewit stock," he says. "We bought about 10,000 shares, kept those, and bought more. We own about 15,000 now."

As expected, Level 3's network build-out was impressive. Crowe secured rights of way from big railroads, including Union Pacific, which is based in--you guessed it--Omaha. Level 3 dug trench, laid cable, and burned through billions of dollars furiously, crossing the Mississippi three times and completing the 16,000-mile North American section in 30 months. Speed was critical because other companies were building networks too. It was not unlike the race to complete the railroads in the old West.

Through 1999 and 2000, quarterly sales raced ahead from $100 million to over $400 million. Meanwhile, Grubman had raised his rating to "1S" (buy speculative) and put a $130 price target on the stock. Soon the go-go mutual funds were loading up on shares. In March 2000, Janus owned 20 million shares of Level 3, Fidelity owned ten million, and Putnam held seven million.

On March 10, the stock hit $130, just as Grubman had said it would! On that day Level 3 had a market cap of some $44 billion--about $4 billion more than General Motors. "The feeling at that time was that Level 3 was a gold mine that was never going to end," says a significant local investor. "If you didn't own the stock, you looked foolish."

Omaha used to be home to another can't-miss stock: an energy-trading company called Enron. Many retired Enron employees still live in the area, and they've hung on to the stock. "I had one family come in and say, 'Dad told Mom before he died never to sell Enron because it was a utility and she could live off it forever,'" says Carson. "It's been devastating." Another big local holding is WorldCom (converted from MFS shares).

Then there's Level 3--which by April 2000 was getting a reality check. The company's big-spending customers, those Internet companies and CLECs, hit the wall. Sales began to wilt, and then so did Level 3's share price. In just one year the stock sank 90%, to $13 a share. (Only then did Grubman cut his price target, from $130 down to $20.)

The problem, as most of us can recite by now, was a sudden glut of capacity. The attic, it seems, wasn't ever going to fill up. If Level 3 had been the only player building a fiber-optic network, it would be hailed as a great success story. But the old telcos--AT&T, WorldCom, and Sprint--were adding broadband capacity to their networks, and upstarts like Global Crossing, Williams, Broadwing, and Qwest were churning out entirely new networks. No question, Level 3 had a great network, says Scott Cleland, an analyst with the Precursor Group. "But it's like a great racetrack. You still need the fans. You still need the customers. And companies like AT&T and Qwest started with customers."

What's more, advances in technology (particularly something called DWDM--dense wave division multiplexing--that can increase the capacity of a strand of fiber by 200 times) caused the cost of adding bandwidth to a network to fall by 99% from 1995 to 2000. Level 3 stock continued to plummet, dropping to $3 in a three-month period.

Still, investors like Omaha lawyer Thomas Dowd, who owns 89,000 shares, hung in. "Granted, it's an industry with problems," Dowd says with remarkable peace of mind. "Crowe told us a long time ago that there would be a tremendous shakeout, but that the survivors are going to have wonderful businesses."

Many of his fellow Omahans are in deep too. One man sold his entire business for $20 million to buy Level 3 stock. Those shares today are worth only $3.5 million. Others made the mistake of building grand homes on the strength of their paper holdings. "I had a neighbor," says one knowledgeable Omahan, "who built a house for $2 million [that's a lot of house in Omaha] borrowed against Level 3 stock. He had a margin call and had to sell it for $1.5 million. He didn't live in the house a single day."

"It's embarrassing to talk about," acknowledges money manager Carson, who won't reveal the exact amount he himself owns. "It's a lot," he concedes. "It was enough money at the peak so that I wouldn't have to work again."

So, did Scott and Crowe bail out of the stock, you wonder? With Scott, the answer is an emphatic no. He has sold next to nothing. With Crowe, the answer is yes--to a point. In 2000, Crowe announced he would begin a regular program in which he would sell a set number of shares, 2,000 to 4,000, a day. As of last June, he had sold about one million shares worth $50 million (giving him an average selling price of $50.) Then he suddenly dumped nearly three million shares. Why? "In the beginning I borrowed money to buy $55 million of Level 3 stock," Crowe explains. "I needed to pay off that debt." And guess who was the buyer of the stock? None other than Walter Scott, who purchased 2.95 million shares from Crowe at $6.75 each, for a total of $19 million. Since then Crowe hasn't sold a share, and he still owns almost ten million shares.

Today, with Level 3's stock below $5, its market cap is down to $1.3 billion (GM's is $30 billion, by the way). As for those three big institutional holders: Janus now owns 550,000 shares, Fido 74,000, and Putnam 10,000. Of the 37 million shares those fund giants once owned, 36.4 million have been sold off.

And guess who bought those shares? No question, many were picked up by Omahans who were dollar-cost averaging the stock, or in some cases doubling up as the stock went down. Almost every Level 3 shareholder we spoke with for this article--Rogers, Dowd, Carson, and others--acknowledged buying the stock as it fell. By FORTUNE's best estimates, perhaps as much as $20 billion--nearly half of Level 3's stock market value at its peak--was lost, on paper at any rate, by Omaha shareholders.

"I saw Walter Scott at a function recently," says one Omaha businessman. "And some guy came right up to him and asked him, 'Hey, what's going on with Level 3? The guy wasn't agitated or anything, but Walter left right after that." Clearly it's tough for Scott, whose own holdings have fallen a jaw-dropping $4.2 billion, to $200 million. "There are some that bought stock at a very high price," says Scott, nodding his head. "I've never had anybody get mad at me or anything. That doesn't mean it won't happen. It's just that I haven't had anybody yet."

The first couple of months of this year were particularly grim for Level 3. On Jan. 29 the company, which had earlier moved its headquarters to Broomfield, Colo., to attract more skilled engineers, took a $3.2 billion impairment charge, adjusting the value of its assets downward by that amount. Revenue has also been lagging. In the latest quarter, Level 3 had sales of $386 million and operating expenses (which includes debt service) of $725 million. With $5.9 billion of debt on its books, Level 3's annual interest costs alone are around $516 million.

Crowe and his sales force have had some luck luring bigger and more stable customers, including SBC and Cox Communications. Says Jay Rolls, vice president of data engineering at Cox: "As soon as we inked a contract with them, the Level 3 guys showed up and stayed for two days straight until we were

up and running. When we called up our other provider, a big player, they basically asked, Why are you bothering us?" Still, the high-tech economy remains weak, and other customers are pulling the plug. Level 3 estimates that some 15% of its recurring revenue is at risk, and that two-thirds of those sales will be disconnected within several months. "Level 3 is in a tough situation because its whole model is based on underpricing the competition--which they can do, but it puts huge pressure on them," says Precursor's Scott Cleland.

Mainstream Wall Street clearly agrees. Merrill Lynch, for one, just downgraded the stock to a sell. Nor do the capital markets seem sanguine about Level 3's prospects. The company's benchmark 9.125% bonds trade around 48 or 50 cents on the dollar and yield 27%. Market observers say at those prices the bond market is betting the company is headed for bankruptcy. "The stock is trading at $4," says one powerful money manager. "Typically the equity markets get these things wrong, so the trade to make would be to short the stock and go long the bonds."

But is Level 3 really in such dire straits? The most surprising twist in this saga is that it just might not be. In fact, there's at least one high-profile investor fishing around in Level 3's equity, Legg Mason's superstar Bill Miller--the only fund manager to beat the S&P 500 11 years in a row. At a recent lunch in Manhattan, Miller, who won't say how big his position is, remarked, "Well, as the saying goes, it's not going to go bankrupt tomorrow, though it's priced as such. But even if it does go bankrupt, it won't be for several years." Another well-regarded money manager, Staley Cates of Longleaf Partners, makes a similar point. As Cates, who is long on Level 3 bonds, put it in a recent conference call: "All that matters to us is [the bonds'] cash flow. Level 3's cash position today of over $1 billion sees us through a good number of quarters before we think there's a true liquidity problem."

Yes, about that cash position. Level 3 has $2.78 in cash per share, enormous in this environment. If you assume that's enough liquid fuel to make it through to the next upswing in the high-speed Internet business, then the company may have a big strategic advantage over its rivals. One called "survival."

Another issue in this market is whether this company has even a whiff of the accounting or other ethical improprieties that have tainted so many other telcos. Buffett and many others stand by Scott as the ultimate straight-shooter. But even Scott seems taken aback by the headlines around him, to the point that he hedges his take on his own company. "In this environment," says Level 3's chairman, "you never can guarantee 100%. I mean, we knew a lot of the things that were going on. We did not participate.... I'm comfortable that our integrity is together. That doesn't mean somebody couldn't go in and find something, but we have always tried to be as open and straightforward as possible."

To that end, Scott won't even guess at the correct valuation of Level 3. "I don't have any idea," he says, when pressed. "I don't know. I don't think you can evaluate it today. I don't know what it's worth. Have no idea."

But if actions speak louder than "I don't knows," Scott believes Level 3 is worth more than its share price. Through the purchase of some warrants, he has effectively invested more money in the company within the past three or four months. "If just keeping my stock is any indication," he says, "I guess you'd have to say I'm convinced Level 3 will make it."

Many Omahans are even greater believers in their savior's leadership. "In the long term, people are the most valuable, and they've got the people," explains Omaha investor Denny Walker, who still clings faithfully to his 15,000 shares. "I never wavered," he says. [...]

Offutt airforce base ... the nuke bomb planes (https://en.wikipedia.org/wiki/Offutt_Air_Force_Base) (2020-09-10-wikipedia-offutt-air-forece-base.pdf)

Offutt Air Force Base /ˈɒfʌt/ (IATA: **OFF**, ICAO: **KOFF**, FAA LID: **OFF**) is a U.S. Air Force base south of Omaha, adjacent to Bellevue in Sarpy County, Nebraska. It is the headquarters of the U.S. Strategic Command (USSTRATCOM), the 557th Weather Wing, and the 55th Wing (55 WG) of the Air Combat Command (ACC), the latter serving as the host unit.

Aviation use at Offutt began in September 1918 during World War I as an Army Air Service balloon field.[2] Originally named **Fort Crook**, it was renamed in honor of World War I pilot and Omaha native 1st Lt. Jarvis Offutt in 1924.

Offutt AFB's legacy includes the construction of the *Enola Gay* and *Bockscar*, the planes that dropped Little Boy and Fat Man over Hiroshima and Nagasaki in World War II. Offutt served over 40 years as the headquarters for the former Strategic Air Command (SAC) and home for its associated ground and aerial command centers for the U.S. in case of nuclear war during the Cold War. The population was 8,901 at the 2000 census.

Canadian Oil Sands Tour Has Omaha Connection

PUBLISHED THU, AUG 21 200812:49 PM EDTUPDATED FRI, SEP 13 20134:33 PM EDT

Alex Crippen@ALEXCRIPPEN

As oil sand stocks continue to rally in the wake of Monday's visit by Warren Buffett and Bill Gates to northeastern Alberta, we may have a "clue" to an Omaha connection for the tour.

Canada's national newspaper ***The Globe and Mail reports today*** that the trip was arranged by Kiewit Corp., an engineering firm based in Omaha that is a contractor on .

Buffett and Gates toured that facility by helicopter and then looked at some other projects in the area from the air, according to the *Globe*, which also says the trip was supposed to be "top-secret."

After picking up 7% yesterday, Canadian Natural is up another 3% to $85.42 in New York Thursday. Current real-time price:

Long-time Buffett friend and former Kiewit CEO Walter Scott, Jr.

Long-time Buffett friend and high-school classmate Walter Scott, Jr. is a former CEO of Kiewit and currently sits on the boards of that company, Berkshire Hathaway and Berkshire subsidiary MidAmerican Energy Holdings. Along with Buffett, he also holds a stake in Omaha's minor league baseball team.

The Globe article stays with the interpretation that while Buffett might be curious about oil sands, it would be very unusual for him to make an investment there. It cites the absence of a competitive "moat" for commodity producers and quotes Buffett-watcher Tony Arrell of Burgundy Asset Management as saying, "I wouldn't have any idea [why he made the trip], but I can hardly think of a time that he has invested in a big, capital-intensive thing."

Current Berkshire stock prices:

Comments (mwk) - gates was at the side of Scott Jr ...

By Jonathan Stempel

NEW YORK, March 1 (Reuters) - Warren Buffett's Berkshire Hathaway Inc. on Thursday said Susan Decker, the chief financial officer of Internet media company Yahoo Inc. , will join its board of directors.

The appointment is effective at Omaha, Nebraska,-based Berkshire's May 5 annual meeting, Buffett said in his annual letter to Berkshire shareholders. **Decker will replace Malcolm Chace, who has been on the 11-person board since 1992.**

Buffett said Decker fulfills his requirements that board members be "owner-oriented, business-savvy, interested and truly independent." He also said her age, 44, was a plus.

"(She) is young -- an attribute, as you may have noticed, that your chairman has long lacked," said Buffett, who is 76. "We will seek more young directors in the future."

In December, Yahoo gave Decker additional responsibility over a new unit focused on advertising, Yahoo's main source of income. The new role was part of a reorganization that may have bolstered Decker's chances of eventually succeeding Terry Semel as Yahoo's chief executive.

Decker is the latest executive from a technology-oriented company to join Berkshire's board. **Others include Microsoft Corp. Chairman Bill Gates and Level 3 Communications Inc. Chairman Walter Scott.**

"He appears to be building some institutional knowledge about technology companies onto Berkshire's board, figuring that in 10 to 15 years technology will be much more important to Berkshire, and a place the company might start moving toward," said Morningstar Inc. analyst Justin Fuller.

Buffett owns more than 50 companies, but generally gets more than half of the profit from insurance and reinsurance.

Chace's grandfather, also named Malcolm Chace, was a key figure in 1929 in merging four New England textile units into Berkshire Fine Spinning Associates, which merged in 1955 with Hathaway Manufacturing to form Berkshire Hathaway, Buffett said. Buffett took control of the combined company in 1965.

William F. Sharpe

[...]

William Forsyth Sharpe (born June 16, 1934) is an American economist. He is the STANCO 25 Professor of Finance, Emeritus at Stanford University's Graduate School of Business, and the winner of the 1990 Nobel Memorial Prize in Economic Sciences.

Sharpe was one of the originators of the capital asset pricing model. He created the Sharpe ratio for risk-adjusted investment performance analysis, and he contributed to the development of the binomial method for the valuation of options, the gradient method for asset allocation optimization, and returns-based style analysis for evaluating the style and performance of investment funds.

Early years

William Sharpe[1] was born on June 16, 1934 in Boston, Massachusetts. As his father was in the National Guard, the family moved several times during World War II, until they finally settled in Riverside, California. Sharpe spent the rest of his childhood and teenage in Riverside, graduating from Riverside Polytechnic High School in 1951.[2] He then enrolled at the University of California at Berkeley planning to pursue a degree in medicine.[1] However, in the first year he decided to change his focus and moved to the University of California at Los Angeles to study Business Administration. Finding that he was not interested in accounting, Sharpe had a further change in preferences, finally majoring in Economics. During his undergraduate studies, two professors had a large influence on him: Armen Alchian, a professor of economics who became his mentor, and J. Fred Weston, a professor of finance who first introduced him to Harry Markowitz's papers on portfolio theory. While at UCLA, Sharpe became a member of the Theta Xi[3] Fraternity and Phi Beta Kappa Society. He earned a B.A. from UCLA in 1955 and a M.A. in 1956.

Academic training

After graduation, in 1956 Sharpe joined the RAND Corporation. While doing research at RAND, he also started work for a Ph.D. at UCLA under the supervision of Armen Alchian. While searching for a dissertation topic, J. Fred Weston suggested him to ask Harry Markowitz at RAND. Working closely with Markowitz, who in practice "filled a role similar to that of dissertation advisor",[1] Sharpe earned his Ph.D. in 1961 with a thesis on a single factor model of security prices, also including an early version of the security market line.

Professional career

In 1961 after finishing his graduate studies, Sharpe started teaching at the University of Washington. He started research on generalizing the results in his dissertation to an equilibrium theory of asset pricing, work that yielded the Capital asset pricing model. He submitted the paper describing CAPM to the *Journal of Finance* in 1962. However, ironically, the paper[4] which would become one of the foundations of financial economics was initially considered irrelevant and rejected from publication. Sharpe had to wait for the editorial staff to change until finally getting the paper published in 1964.[5] At the same time, the CAPM was independently developed by John Lintner, Jan Mossin, and Jack Treynor.

In 1968 Sharpe moved to the University of California at Irvine but stayed there for only two years, and in 1970 he moved, this time to Stanford University. While teaching at Stanford, Sharpe continued research in the field of investments, in particular on portfolio allocation and pension funds. He also became directly involved in the investment process by offering consultance to Merrill Lynch and to Wells Fargo, thus having the opportunity to put in practice the prescriptions of financial theory. In 1986, in collaboration with the Frank Russell Company, he founded *Sharpe-Russell Research*, a firm specialized in providing research and consultancy on asset allocation to pension funds and foundations. His 1988 paper, 'Determining a Fund's Effective Asset Mix', established the model later referred to as returns-based style analysis.[6]

Later career

In 1989 he retired from teaching, retaining the position of Professor Emeritus of Finance at Stanford, choosing to focus on his consulting firm, now named *William F. Sharpe Associates*. In 1996, he co-founded Financial Engines (NASDAQ: FNGN) with Stanford Professor Joseph Grundfest and Silicon Valley lawyer Craig W. Johnson.[7]Financial Engines uses technology to implement many of his financial theories in portfolio management.

Today, Financial Engines has over 200 employees and is the leader in automated retirement plan investment advice and management, with more than $200 Billion in managed retirement accounts, providing advice and managed account services to employees in over 1000 major corporations. In March, 2018, Financial Engines was acquired for $3 Billion in cash.[8]

Sharpe served as a President of the American Finance Association and he is a trustee of the Economists for Peace and Security. He is also the recipient of a Doctor of Humane Letters, Honoris Causa from DePaul University, a Doctor Honoris Causa from the University of Alicante (Spain), a Doctor Honoris Causa from the University of Vienna and the UCLA Medal, UCLA's highest honor.

Since 2009, Sharpe has been an advocate of "adaptive asset allocation" strategies, which seek to exploit recent market behaviour to optimise asset allocation and thus maximise returns and reduce volatility[9][10]

OTHER POSITIONS:

Associate Editor, The Journal of Financial and Quantitative Analysis, 1966-1972.
Associate Editor, Management Science, 1970-1972.
Associate Editor, The Bell Journal of Economics and Management Science, 1970-1973.
Editorial Advisor on Finance and Computer Science, Praeger Publishers: New Directions in Management and Economics Series, 1970-1972.
Visiting Professor, London Graduate School of Business, January, 1972.
Member, Policy Committee, Computer Research Center for Economics and Management Sciences (National Bureau of Economic Research), 1972-1975.
Senior Research Associate, National Bureau of Economic Research, 1976-1977.
Trustee, College Retirement Equities Fund, 1975-1983.
Director, American Finance Association, 1977-1978.
Director, Western Finance Association, 1978-1980.
Trustee, Financial Analysts Research Foundation, 1978-1981.
Vice President, American Finance Association, 1979.
President, American Finance Association, 1980.
Associate Editor, The Journal of Finance, 1983-1986.
Research Associate, National Bureau of Economic Research, 1982-1986.
Co-director, Stanford-International Program inInvestment Management, 1983-1985.
Co-director, Stanford-London Graduate School of Business Investment Management Program, 1986.
Academy of Financial Services, Board of Directors, 1986-1987.
Member, Prize Committee, Institute for Quantitative Research in Finance, 1983-1992.
Member, Advisory Board, Program in Finance, Golden Gate University, 1986-1992.
Trustee, Research Foundation of the Institute of Chartered Financial Analysts, 1987-1993.
Member, Council on Education and Research, the Institute of Chartered FinancialAnalysts, 1987-1993.
Member, Task Force on the Body of Knowledge, the Association for Investment Management and Research, 1990-1991.
Member, Visiting Committee, Jerusalem School of Business, Hebrew University, 1993
Juror, Prize in Economy, "Rey Jaime I" (Spain), 1995, 2000, 2005, 2006, 2007
Trustee, Dominican College of San Rafael, 1987-1989, 1992-1996
Trustee, AXA Rosenberg Mutual Funds 1988-2003.
Associate Editor, The Journal of Fixed Income, 1991-1995
Trustee, Smith Breeden Associates, Inc., 1992-2000.
Senior Fellow, International Association of Financial Engineers, 1993-
Member, Financial Economists Roundtable, 1993-2003
Director, Stanford Management Company, 1993-2001.
Director, C-ATS Software, 1994 -1997
Distinguished Fellow, The Institute for Quantitative Research in Finance, 1994 -
Adviser, Japanese Financial Economics Association, 1994 -1990
Member, Charles Schwab Financial Services Advisory Council, 1994-1997
Director, Financial Engines, Inc. 1996-2010

COURSES TAUGHT:

1960: University of California at Los Angeles (Extension)
Price Theory

1960: San Fernando Valley State College
Intermediate Price Theory

1966: University of California, Berkeley
Intermediate Price Theory

1961-1968: University of Washington
Price Theory
Intermediate Price Theory
Managerial Economics
Business Finance
Capital Allocation
Investments
Portfolio Analysis and Security Analysis
Introduction to Data Processing
Computer Programming
Computer Programming Languages
Business Statistics
Operations Research
Seminar in Operations Research
Research Seminar on Computer Programming
Executive Development Program
Computer Programming Languages

1968-1970 University of California, Irvine
Elementary Economics
Micro-Economic Theory
Computer-Assisted Instruction in Economics
Economics of Securities Markets
Economics of Computers
Prices in the Central City
Portfolio Theory and Capital Markets

1970 - 2001 Stanford University
Portfolio Theory and Capital Markets
Investments
Micro-Economic Theory
Theory of Finance
Financial Aspects of Pension and Endowment Funds
Institutional Investment Management
Portfolio Management
Macro-Investment Analysis
Protected Investment Products

Nancy Jacob named ninth dean

1981 • In 1980s, Deans, Diversity, Milestones

Nancy Jacob (1981-89), ninth dean of the School of Business Administration, becomes the first woman to lead a major American business school. Her administration launches the Executive MBA Program, centers for banking and retail management, and a program to promote economic, ethnic and gender diversity among the study population.

As an undergraduate at the UW, Jacob (BA 1967) worked as a research assistant to Nobel Prize-winning financial economist William Sharpe, eventually co-authoring an early book on the economics of computing. She earned her PhD in financial economics at UC-Irvine and became one of a select few women teaching finance at the university level. In 1978 she became chair of the Department of Finance, Business Economics and Quantitative Methods.

During her tenure as dean, she drives many important initiatives and innovations at the School of Business Administration. Among them the Executive MBA Program, the Center for the Study of Banking and Financial Markets, the nation's only Center for Retail, Transportation and Distribution Management, the Business Education Opportunity Program (BEOP), and *Pacific Northwest Executive*, a quarterly magazine focused on the financial, managerial and policy issues of the region's economy.

After retiring from the UW, Jacobs will found and lead two successful investment firms and continue her nearly 40-year service as a trustee of TIAA-CREF.

Upon receiving the Foster School's Distinguished Leadership Award in 2014, Jacobs will reflect on the dearth of women in finance at the beginning of her pioneering career, and comment on the ongoing challenges for women in every traditional male-dominated field.

"We make a big deal of the glass ceiling for women executives in their careers," she will say. "But that's misleading because life is not a vertical climb. It's a multidimensional trip. It doesn't come with an *easy* button or a *fair* button. It is what it is. But when one door closes, another opens. You have to be flexible and you have to be willing to deal with adversity."

How much Bill Sharpe influenced her ... Foster School 2014 Distinguished Leadership Awardee Nancy Jacob (BA 1967)

- **Dr. Francis Peyton Rous (born 1879)**
  - [HP005P][GDrive] : (In 1934, Rous' Rockefeller Institute colleague, [**Dr. Richard Edwin Shope (born 1901)**], asked [**Dr. Francis Peyton Rous (born 1879)**] to examine warts on jackrabbits that had definitively been shown to be caused by an ultrafilterable virus. This virus was Shope papillomavirus (rabbit papillomavirus). When Rous confirmed that the warts were benign tumors, he was reinvigorated in his intent to unravel the mysteries of viral oncology. Over the next 30 years, Rous and his colleagues showed that the benign tumors could progress to malignant carcinomas and that chemical carcinogens could interact with the virus— further discoveries that formed building blocks for modern virology. Today, we recognize that ≈20% of human cancers worldwide have infectious etiologies, for which preventive measures such as vaccines have great promise.)

[...] Richard Edwin Shope (December 25, 1901 – October 2, 1966) was an American virologist who, together with his mentor Paul A. Lewis at the Rockefeller Institute, identified influenzavirus A in pigs in 1931.[1] **Using Shope's technique**, Smith, Andrewes, **and Laidlaw of England's Medical Research Council cultured it from a human in 1933**.[1] They and Shope in 1935 and 1936, respectively, identified it as the virus circulating in the 1918 pandemic.[1] In 1933, Shope identified the Shope papillomavirus, which infects rabbits. His discovery later assist other researcher to link the papilloma virus to warts and cervical cancer. He received the 1957 Albert Lasker Clinical Medical Research Award.[2]

Career

In 1931 Shope worked as researcher and together with [**Dr. Paul Adin Lewis (born 1879)**] at Rockefeller University discovered that the cause of swine flue was virtually identical to bacillus influenza, a bacteria that had in 1892 been identified as the cause for human influenza. Shope and Lewis went on to identify a virus that also had links to influenza, putting into doubt the thesis that flue was caused by a bacterial infection. Soon after this controversial discovery, Lewis traveled to Brazil to study an outbreak of yellow fever. **The 28 year old Shope had put himself forward for this research trip, but his offer was refused by Lewis. Instead Shope continued to research swine flue. Lewis did not return from the research trip, as he died of a yellow fever infection brought about by a laboratory accident.**[3]

Shope continued his work at the Department of Animal Pathology at the Rockefeller Institute for Medical Research in Princeton, New Jersey.[4] In 1933 Wilson Smith, Christopher Andrewes, and [**Sir Patrick Playfair Laidlaw (born 1881)**] isolated the influenza virus. In 1935 Shope found that humans that had been alive during the 1918-1919 swine flue epidemic still carried antibodies against the swine flue virus.[5] Throughout the 1930s Shope continued to research swine flue. While studying swine flue on farms in Iowa Shope discovered that virus infections caused the mad itch, also known as pseudorabies, in cattle. Scope also discovered that virus infection caused fibroma in the cottontail rabbits he had hunted in New Jersey, and that a virus infection was also responsible for the papillomatosis in the cottontail rabbits he had observed in Iowa. By the last 1930s Shope had established himself as a well-known expert with a reputation as a virus hunter.[6]

Shope left the Rockefeller Institute to join a research team the Canadian Department of National Defence and the US War Department established to investigate rinderpest.[7] The research team was based in Canada, but Shope could not commence research at the speed he was accustomed to, as he was also in active service as Commander in the US Naval Reserve.[8] In 1943 Shope presented his team's research on rinderpest at a meeting hosted by George Merck.[9]

Family

His son [**Dr. Robert Ellis Shope (born 1929)**] was also a virologist, who specialised in arthropod-borne viruses.[10]

MONDAY, OCTOBER 3, 1966

Dr. Richard Edwin Shope Dead; Pathologist at Rockefeller U., 64

Dr. Richard Edwin Shope, a physician and animal pathologist internationally recognized as an authority on the field of virology, died of cancer of the pancreas yesterday at James Ewing Hospital. He was 64 years old and lived in Kingston, N. J.

Dr. Shope was a member and professor of Rockefeller University here. He had been on its faculty and that of its predecessor, the Rockefeller Institute, since 1925.

Study of Encephalitis

Dr. Shope was the first to isolate an influenza virus, the first to establish the feasability of animal immunization against influenza and the first to offer an explanation of the pandemic Spanish flu of 1918-19.

Through his many experiments with animals, he added considrably to the understanding of malignant tumors.

In studying mosquitoes as carriers of the dreaded "sleeping sickness" in New Jersey six years ago, he was stricken with the often-fatal disease and was one of the few victims to recover without permanent brain damage. Members of his family said last night that Dr. Shope's death had not been complicated by possible traces of the encephalitis.

Dr. Shope, the son of a physician, developed in his youth an interest in animals on the family's farm near Des Moines, Iowa, where he acquired an elementary knowledge of poultry anatomy by dressing chickens.

Later, while a premedical student at the State University of Iowa, he decided he would prefer research to practice. He received his medical degree in 1924 and conducted experiments with dogs while an instructor in pharmacology in the university's College of Medicine.

A year later, Dr. Shope was named an assistant to Dr. Paul A. Lewis of the animal pathology laboratory of the Rockefeller Institute in Princeton. He served as an assistant for five years, as an associate for four and as a member until 1949. He then was with the Merck Institute in Rahway, N. J., for three years, after which he became a member and professor at the Rockefeller Institute.

In 1928, Dr. Shope and Dr. Lewis initiated work on swine influenza and established that the disease resulted from the concerted activity of a bacterium and a virus. Their studies with swine demonstrated in this disease a hemophilic bacillus, resembling Pfeiffer's bacillus, which had long been suspected of producing influenza in human beings, and a virus like the one found two years later to be responsible for human influenza.

Shortly thereafter, Dr. Shope and his associate identified the swine lungworm as reservoir and intermediate host for the swine influenza virus and described a method of vaccination against the disease, later applied in principle to human flu.

Dr. Shope later made a significant contribution to scientific knowledge of malignancy. Experiments with a tumor occurring in midwestern cottontail rabbits revealed that the virus from cottontail papillomas cause similar growths in domestic rabbits, which eventually became cancerous. The rabbit tumor was the first with malignant potentialities in a mammal to be proven to have been caused by a virus.

Bitten by Mosquitoes

In 1960, Dr. Shope conducted research on Eastern equine encephalitis, a virus inflammation transmitted by mosquitoes and often called "sleeping sickness."

He went to southern New Jersey to collect virus-bearing mosquitoes. Bitten, he soon displayed "sleeping sickness" symptoms and a co-worker, Dr. Delphine Clark, recovered live virus in his blood—the first to be taken from a living person. Dr. Shope recovered in a few weeks and returned to his work on the disease.

Dr. Shope sat on many advisory committees, among them those of the United States Public Health Service, the National Academy of Sciences and the National Cancer Institute.

He held honorary degrees from Yale University, Rutgers University, the University of Chicago, the University of Pennsylvania, the University of Utrecht in the Netherlands and Justus-Liebig University in Giessen, Germany.

The slender, 6-foot, 2-inch amateur fisherman and gardener was recipient of many awards, including the Semi-Centennial Research award of Sigma XI, the John Phillips Memorial Medal of the American College of Physicians, the Kober Medal of the Association of American Physicians, the Albert Lasker Award and the Bertner Foundation Award. He held memberships in the National Academy of Sciences, the American Philosophical Society and the Harvey Society.

In presenting the Kober Medal, Dr. Peyton Rous, a noted Rockefeller University pathologist, noted that this was only the second time the Association of American Physicians had so honored contributions to the health of domesticated animals. "Dr. Shope," he said, "is beyond all else a naturalist. . . . His feeling for animals is not sentimental but compassionate."

Surviving Dr. Shope are his widow, the former Helen Madden Ellis; three sons, Dr. Richard E. Jr. of Minneapolis, Dr. Robert E. of New Haven and Dr. Thomas C. of Minneapolis; a daughter, Mrs. Richard Fitz-Gerrell of Boulder, Colo.; a brother, Raymond H. of Des Moines, and a sister, Mrs. Pierre Le Bourdais of Honolulu.

A memorial service will be held tomorrow at 2 P.M. at the First Presbyterian Church in Princeton, N. J.

Dines Carlsen, Artist, Dies; Winner of Design Prizes

Dines Carlsen, an artist, died on Saturday at St. Luke's Hospital. He was 65 years old and lived in Falls Village, Conn., and Summerville, S. C.

Mr. Carlsen studied art under his father, Emil, also an artist. A member of the National Academy of Design, he won its third Hallgarten Prize in 1919 and its second Hallgarten Prize in 1923.

His paintings of still-life and flowers, have been hung in the Corcoran Gallery, washington, the John Herron Art Institute in Indianapolis, and the Grand Central Art Gallery.

His widow, the former Florence Gulick Shaw, survives.

RILEY H. ALLEN

HONOLULU, Oct. 2 (AP)—Riley H. Allen, editor of The

ditioning Engineers, died Friday at the Swedish Hospital in Seattle. He was 66 years old and lived on Mercer Island off Seattle.

Sept 30, 1966, wife of Charles I. Clark. Service at the Fairchild Chapel Franklin Ave at 12th St, Garden City Wednesday 8 P.M.

CORNMAN—Ida R. Beloved wife of Morris, devoted mother of Sivia and Andrew Brodsky, loving grandmother of Ann and Gregory Brodsky, dear sister of Esther Schwartzman, Bella M. Katz, Dr. Rose J. Sachs, Minna S. Barkan, Florence Levin, Joseph and Howard Lane. Services at Riverside Chapel, Coney Island Ave at Ocean Pkwy, Bklyn 1 PM Monday. Please omit flowers.

CORR—Irene W. On October 2, 1966, devoted mother of William. Reposing at Frank E. Campbell, Madison Ave at 81 St. Requiem Mass, Church of St Ignatius Loyola, Park Ave and 84 St, Tuesday, 10 AM. Interment Troy, N. Y.

CRABBE—Idoline Watts, Beloved mother of Mrs. William Scheerer 2nd and David Mackay Crabbe, dear sister of Harry Dorsey Watts, Jr., Delray Beach, Fla., Mrs. Harold McTigue, and Mrs. Evelyn Watts Fiske, Santa Barbara Calif. Funeral Services at Trinity Church, Hewlett, L.I. 10 A.M. Tuesday

[Russell Currier] Yeah! I wanna just talk just briefly about One Health, and the, uh... Let's see, yeah, and those concepts, but before I even get into that, if you

want, uh, some nice reading material, I've displayed a book called **Zoobiquity** there on that center table, and I got interested in that book when I had a subscription to the Sunday New York Times. The week in review section had, the front page of that section, 2/3 of it was on this book and then it continued inside, and it was two full pages, by Barbara Natterson-Horowitz and Catherine Bowers. One of them dated must've dated the editor there or something in years past. Because they just, they just went full hog on that thing, and it's very, very good. I've met these gals on several occasions, and they're delightful and very accomplished and, uh, you'll get a whole concept of One Medicine, you might say, or One Health, and she's just one of a few other key physicians that are working in the area. Let's talk just a little bit about One Health. A lot of people have a very narrow view of this and think it's just Zoonotic disease, which is, uh, somewhere around here. Let me see. Well, it doesn't make any difference. But it really embraces all the major disciplines, now includes environmental health and plant health, and it's incredibly important that if something happens in one area, it's gonna impact another. So, that comes to mind with one of the leaders in this movement, another physician, along with Barbara Natterson-Horowitz who I mentioned there, is Laura Khan, too, who's just published a book in the last year on antimicrobials in livestock production. So, that's, I see Zoonotic infections here now. So I mean, it's a big concept, and it's bigger than just Zoonotic disease. Let me say that it even brings in evolutionary concepts, and it calls for interdisciplinary investigations and cooperation, so that just gives you some idea of that.

[...] One Medicine thing goes back for hundreds of years, and you might say it peaked in about the 19th century. There was a lot of collaboration between physicians and veterinarians. Many physicians around the staff at veterinary colleges. In fact, the first veterinary college, established 1761, was staffed entirely by physicians. So, uh, it's kind of had a resurrection in just the last quarter-century, but the most depressing, minimal amount of effort in this area was actually in the inter-work area of the first half of the 20th century, from about 1915 through 1945. There were two exceptions to that, two exceptions, and here is the first of those two. This is Karl Frederick Meyer.

[Karl Frederick Meyer] was a veterinarian that was educating in Switzerland, and he accomplished just a number of major things. This is just a short list. It goes on and on, and he was, it's been said that, if it wasn't for World War 2 he probably would've been nominated for the Nobel Prize. So, he was quite the guy. And you notice that there's MD after his name. We'll get to that in a minute. If you want some reviews, and I think these slides are accessible through Donna or somewhere, a nice bio was written by him in, for the National Academy of Sciences, by Albert Sabin of polio vaccine fame, and there's a couple short little recent pieces by Pospischil and Konigsbaum, if I got that right, in the last few years on him. He's just a remarkable person. And it led to the awarding of the Laker Award, which we'll talk about, but he was the he was an incredible guy. [...] He got into trouble during World War Two. He was from the German part of Switzerland, and he had a heavy German accent, and he came under suspicious, you know, during the McCarthy era and he lost his security clearance and what have you. So, with that approaching, he had gotten an honorary MD degree from the College of Medical Evangelists of Yorba Linda, California for his work on saving the canning industry of California from Botulism, especially for olives and mushrooms. And so, in summary here, this is in bold type, Meyer was a veterinarian who masqueraded as a physician.

The second person is the topic of today's lecture, [Richard Edwin Shope,] and he was a physician who masqueraded as a veterinarian. Just a remarkable person.

He was born December 25th, of course we all recognize that date as Christmas Day, and I would like to read a paragraph very quickly from his daughter's term paper in high school of 1952, largely dictator by Doctor Shope. "Christmas Eve night of the year 1901," "It was cold and snowy outside, but inside the Shope house" "at Riverview Street, Des Moines, Iowa, always warm and cozy." "There was a blazing fire in the old fireplace," "But the only two taking advantage of it" "Were Doctor Charles Cornelius Shope, prominent physician" "In Des Moines, and Julia Anderson, MD." "Both were quite nervous, still, for Mrs. Mary Hashille" "Was expected to bear his first child." "They left at 5 o'clock in the morning of December 25th." "Doctor Watson, the family doctor, appeared" "and announced that that the Shope's" "First child was a long, skinny boy." "A few days later, Doctor Watson examined Richard" "And said that he was jaundiced," "And would probably not live." "However, Richard did full through," "And in five months he weighed 17 pounds, he could get" "Up and walk at the age of nine and a half months." So that's a little bit about [his] birth.

[Richard Edwin Shope] went out to Iowa State College to enroll in a course in forestry, but the office was closed, so, and this is true, he hopped a freight train for IOC and enrolled in pre-medical studies here, and became quite a tremendous student. There he is as a student athlete, both for varsity football and for track and field. He ran the 440 and the Hertz, and did quite well in those areas. He entered the college after two years of pre-med. This is also his daughter Nancy's birthday. While in medical school, he was expelled for writing a makeup example of physical chemistry for a classmate. His period of expulsion lasted for his Christmas vacation, so the only actual penalty turned out to be a failure in the course despite straight A grades throughout the semester. He was also made ineligible for one year from competing in football and track. Furthermore, he was required to make up his course in physical chemistry during the Summer between his freshman and sophomore years. The remainder of his [...] school career was without serious consequence. His grades good, and in his senior year he was elected to Alpha Omega Alpha at the honorary Omega fraternity. He was also chosen president of his senior class, and overall the University of Iowa president. So he was quite the man. And, uh... One of the... Things that he had to do, you know, he was about 16 maybe going on 17 when he got here. There was a compulsory to be the same as ROTC today, it was called SATC, and so he was put in a special group of boys called the Saturday, what was it, Saturday Afternoon Tea Club, I think, for SATC, and did fairly well there. So, and in the year 1918, which includes this period, of course, several of those boys in that quasi-military group died from the influenza. So, it was pretty serious stuff. He remained in Iowa. You know, it's been said that medical schools are monsters that devour their own young. That was particularly true here in Iowa, because he nearly went on staff here and taught pharmacology, and did research of, on tuberculosis.

And then he [got] a call from [Dr. Paul Adin Lewis (born 1879)]. He was referred by his pharmacology professor to come to Princeton and work with Paul Lewis. [Dr. Paul Adin Lewis (born 1879)] was the, one of the two [first] scientists to work with the polio virus, but he had this research on animal diseases and that sort of thing. [Richard Edwin Shope] got married here. He married Helen Ellis of Lineville, Iowa, who's father was a physician, and actually Richard Shope did the practices for both his father and his father-in-law during the Summers when they were on vacation. He made extra money that way. And they, what was really interesting is that he had been a, he met his wife by, it was raining hard and she'd come to the overhang of their rooming house, and he thought it was his girlfriend at the time, and so he went out and he realized it wasn't. But he obviously liked what he saw. He asked her out the following Saturday and seven months later they were married. And then they took that big trip east. That trip took eight days in that $35 jalopy, and it was was covered with graffiti and sometimes, I think it was West Virginia or Pennsylvanian, it was crank-start. There was no electric start, and he couldn't get it started, and someone, a crowd of spectators came around there and watched that and they said, well, you know it says here painted right on your car to shake before starting. So he shook the car, and a quarter of a turn later it took off. So, things improved after that.

[Richard Shope], as he was working on hog cholera at that time with **Dr. Charles Murray**, a professor over at Ames, asked him, "Why don't you look into something we don't know about" "Anything about: hog flu?" And Shope realized that if he could find the cause of hog flu, it might be the answer to human flu, too. And he received assistance from a practicing veterinarian here in IOC, **Dr. Fred Crow**, and the whole thing about the swine connection was very controversial. Cedar Rapids had a national swine show the last few days of September, and October, and there had been influenza-like illness in west central Illinois in August. Well, when you bring all these pigs in, lo and behold, it really took off. This show was actually shut down early because of that. At any rate,

Illinois in August. Well, when you bring all these pigs in, lo and behold, it really took on. This show was actually shut down early because of that. At any rate, the... The fellow by Dr. Koen was actually on two sides, he says, "I have no apologies to offer of my diagnosis of flu." "Last fall we were confronted with a new condition," "If not a new disease." This was never in swine textbooks. "I believe I have as much to support this diagnosis in pigs" "As physicians have to support a similar diagnosis in men."

"The similarity of the epidemic among people" "And epizootic among pigs was so close, the reports so" "Frequent, that the outbreak" "in the family would be followed" "Immediately by an outbreak among the hogs." "Striking coincidence. It looked like flu," "It presented identical symptoms of flu," "It terminated like flu." "Until proved that it was not a flu," "I shall stand by that diagnosis." And that statement is in every review paper on the history of influenza, but it's very, very good. So, Shope had a natural interest in that.

Before we go on, I wanna talk just briefly about [Dr. Theobald Smith (born 1859)], because he was **at the Rockefeller Center** heading up this research in the final years of his long and productive career. **But he worked originally, he was a physician, that originally worked for the Bureau of Animal Industry in the US Department of Agriculture, and he headed up the team under Daniel Salmon, that's who the genus salmonella's named after, to look at Texas cattle fever, and this was, needed a lot of work, and it was spreading, and it was a major problem with livestock production. And he worked with another veterinarian by Fred Kilbourne, and Cooper Kurtz who was both a veterinarian and a physician, and a crackerjack pair of cytologists. But they had worked out that indeed it was tick-transmitted, it was a... Protozoan by the name of babesia [see https://en.wikipedia.org/wiki/Babesia]. And it was transmitted on by a tick called Boophilus annulatus. But this, I think, came out at around 1892, this report, and this opened up the whole field of inquiry of thinking about arthropods as vectors in disease. And so the work on malaria, Walter Reed on yellow fever and his team and on plague, on being flea-transmitted, was enabled by this. So this was really groundbreaking work, and that laboratory at the Bureau of Animal Industry, was so effective that the Marine US Public Health Service Marine Hospitals said that, you know, we need a laboratory too. Theyfor one in agriculture. You know it today as the National Institutes of Health.**

So, Richard Shope had two inspirational figures. One was Paul Lewis, who later, shortly after the work here, isolated the flu virus, went down to work on yellow fever in Brazil, caught it in the laboratory and died just after a few days of illness.

So, Paul Lewis was a very unfortunate thing. So, the real big event occurred in 1930, and Shope was a lover of the fellow by the name of [Sir Patrick Playfair Laidlaw (born 1881)] from Britain to connect swine flu to the 1918 pandemic strain.

This is a little bit about Paul Lewis that I forgot about, but anyway, he worked with a fellow by the name of **[Dr. Simon Flexner (born 1863)]** to find a vaccine for polio.

Well, they had one, and who he protected for the monkeys, and Simon Flexner was the brother Abraham Flexner who did the study at the medical schools, particularly here in Iowa, among others, to improve education and patterned after the Johns-Hopkins Model, and is uh, as um, Jim Hanson told me, you know, I was trying to discuss this with his, he says well, look Russ, I'm paraphrasing here, but he said, Johns-Hopkins was an example of a good medical school.

The University of Iowa was an example of a bad medical school. So, they'd really changed things around here. But that would be the brother of Simon Flexner.

Now, one of the real problems, Shope had three sons and a daughter, and the oldest son, Richard Jr., became a veterinarian, and the second son, Robert Shope, become an arbo-virologist who was charismatic, and almost was very effective and isolated a number of flu viruses and so forth.

But here's where our friendly New England Journal of Medicine, you know, with those eagle eye editors, they said, "The breakthrough came in 1931 when Robert Skype," "A veterinarian, transmitted the infectious agent" "Of swine influenza."

Well, first of all, the names are wrong. It should be Richard Shope, and he was a physician, not a veterinarian. So, um... And then, what Dick Shope did, he worked with a British team that was looking at this, too.

They had them doing research with ferrets on distemper which is very important, as you know, in dogs, but several other species as well.

So they had this colony of ferrets and got interested in this, and they tried to infect ferret intra-nasally, and they could not do it.

I think Shope's suggested that they anesthetize them, and uh... And still infected, that infective material with virus deeper, and they got infection all the time.

And ferrets now are identified as being exquisitely susceptible to all influenzas.

And they adapted it to then run it through a hundred times, then into mouse, and you could see the thing and finally got it to grow in pigs, and they blamed the vaccine that came out when, I think the late 40's, but that was quite an accomplishment.

And here, Shope wanted his name to identify with Shope Fibroma and also Shope Pappilloma, and here's an example of the, an artist's rendition of the Pappilloma, and it almost looks like they have horns.

Taxidermists had a ball with these things.

What they would do is, with jack rabbits, the taxidermists would, and attach antelope horns pheasant wings on the side and call 'em flying jackalopes 'til they were a postcard entity of Walldrug and places like that out west.

The next thing is, is that this actually helped with the development of Gardacil vaccine.

I put that picture of that bunny rabbit there, is from a New York Times article which I have here, and I'll just read you the first two sentences.

It says, "Nuns and Jews, cow warts and rabbit horns." "The common link: They are all crucial elements to the" "search for the world's newest vaccine."

And, uh, I won't get into all the detail on that, but Shope's work was foundational in terms of dealing with that. [...]

This is Camp Dodge, Iowa, during World War I, and there were 18,000 men grouped there to form the Statue of Liberty. That was a very, very active base at the time, and uh... They had an influenza episode there in the fall, and one of the interesting things, and Shope pointed this out in a review article which I'll be talking about a little bit later, but they were struck, uh, the 2nd Infantry Regiment was in Hawaii in the Spring. In June, were... Affected by the first wave of that flu. That was actually some of the big nature's vaccine scream. They were transferred to Camp Dodge in August, and then in September, October of, I mean, they almost needed trucks or something to cart away dead soldiers because it killed 6.8%. But virtually none of the men in Hawaii in June became ill with this 1918 thing. In subsequent research, uh, when... When Shope got to really working with this, he had a mild case of influenza in swine, and he gave that term a name called Filtrate Disease. And then he finally discovered that they also needed a cold pathogen called Haemophilus influenzae suis, and this, uh, was that, and the full-blown flu in which it had this funny, whooping-type breathing called thumping. Pigs that were affected by this were called thumpers. So he, you know, he basically identified what a complicated thing, and up to this time, the human influenza was assumed to be due to or Haemopilus influenza, a little different strain. But Shope was a student, certainly, of the disease. So anyway, um... One of the things that puzzled Shope was that there was just no hog flu almost all year 'round, and then the first cold wave of weather in Autumn each year, which was a stressor, these swine would just all break out with this disease. So, how did it occur? How did it maintain itself? And this where he went down somewhat of a controversial thing, and he postulated that lung worms, that swine were affected by, lay eggs in small bronchials that are coughed up and swallowed to go out with the feces, and then eggs are consumed by earth worms, and later the worms are eaten by pigs. A delicacy for them. Pass through the stomach into the, and then came out. They go through three stages in the worm, earth worm, and two stages in the swine as they're migrating back to their This cycle was never fully confirmed, but I for some reason put this in to show this... Basically. It's kind of gross, transparent look at pigs. And he postulated that the virus ran intostate or masked state, that's sometimes used, where you can't isolate it no matter how many earth worms you grind up. Well, Christopher Andrewes isolated the first human influenza virus, and he and Shope became just very good friends, and they traveled back and forth across the ocean to see each other. In fact, Shope took him up to Woman Lake, Minnesota, where his family's cabin is, and worked with, uh, Anyway, Andrewes and his co-investigators Smith, Wilson, and Laidlaw, were later knighted for this accomplishment. And uh... In those years, Shope basically said that the human and swine influenza were remarkably the same and have a lineage. He also worked with some other things, like mad itch, or pseudorabies, which we've heard about because of the program with he Iowa Department of Agriculture eliminated that, but generally it's a mildly, not of major consequence, at least to older swine. But they still got rid of it. But in cattle, it just devastating, and he showed that. The first big swine diseases textbook, called Dunn Swine, by an editor by the name of Dunn, it, he wrote the chapter on wolf influenza, Shope did, in probably the second as well as this pseudorabies. So, he was quite the guy you'd ask for. A lot of the emphasis from his work identified him as being a veterinarian. He also worked with swine pox here, and showed it could be, although not necessarily, transmitted by the agency of pig-swine-lice. On viruses and cancer, we've already talked a little bit about this. I'm jumping around a bit. This changed the, uh, in domestic rabbits, it's very serious. It was rare in wild rabbits, and he got busy with other work. He then worked with a fellow by the name of [Dr. Francis Peyton Rous (born 1879)], and he had been working with chickens, sarcomas in chickens, and uh... And his work from, the hand-off work form Shope, enabled him to get the Noble prize. Rous had been nominated for this both before and after World War II, I think he finally got it '66. Probably Shope was no longer alive. But he was the, tied with someone else with being the oldest recipient to receive a Noble prize, and that is... Anyways, we get into the 1940s, of course World War 2 happens, and Shope was assimilated into the Navy, and the first thing the Navy did was assign him to the Army. A special project to develop a Rinderpest vaccine. This is cattle plague. The Rinderpest is a take-off of a German word. It was a joint Canadian-US project on Grosse Island in the Saint Lawrence River, and it took them 19 months, but here they adapted that virus through, into, uh, hens' eggs, and it was protective against... That. Later in the 1950's, a Doctor Walter Plowright, due to using bovine kidney cells, developed a vaccine. Well, it was improved. It was so improved that it really enabled the uh... Eradication of Rinderpest, which was a big problem with African livestock, and he was honored, and I went to this ceremony in Hoyt Sherman in Des Moines in 1999. He world the World Food Prize for that work. Well, after that project on Rinderpest was done, he was transferred back to the Navy. He was transferred to Guam and Okinawa after an assault began, and started to study tropical diseases. And he had a curious thing happen to him. He found a mold growing on the covering of his wife's photograph on his desk, and he scratched off some of that, grew it, and found that the, trying to recall the name of... Doesn't make any difference, but it was mold. And he it in vivo antiviral properties, and he named it after his wife Helenine. It was a nucleoprotein that stimulated interferon production. In fact, the journal CA, if any of you wanted to look that up, it's a two-page article here, talks about that, and there was an interesting quote, gotta find it, of course, here, because I'm getting off-script... Here's the paragraph from it. "Doctor Shope's discovery of Helenine" "And its antiviral effects might be considered an accident," "But for the creative mind discovery is never completely" "An accident." "It is the mind which finds the significant significance" "In the insignificant." "Mystery in the commonplace." "A scientific achievement is, in reality," The next logical step in the never ending process" "Of adding one new observation to another, building" "On those that have been made before." So, it was quite the deal. When he got back, he got busy, and... Developed an effective vaccine to a South American rat disease that was delivered and they introduced it to Great Britain. You know, I don't know if you are aware of this, but if you get to certain insular cysts, rats just take off. We all think of Australia, but when I was in the I went to Puget Sound to, um, exercise those two, um, what are they called? Yeah, Friday harbor. I went there and rode the jeep around and what have you, and our commanding officer says, you can't step anywhere in thisexcept under the right reasons. You know, it was just that bad. I got back for a visit a few years ago, I asked the, uh, a clerk in the store, it was kind of interesting, he said, ah, yeah I grew up here and we just ate a lot of rabbit. She saysyou know, because there were just so many. But, when they start drilling into fields, that's like, you know, gophers in southern Minnesota, you know, it'll affect farming equipment and what have you. Well, this

virus got into France where they had domestic rabitries for food use, food pro, er, meat production, and the vaccine that he developed for this actually saved the French rabbit industry. He also, in the 1950s, isolated a second benign-tumor virus. He also was the first to isolate and identify the hemorrhagic disease virus of deer. And in our southern counties, every year, especially if it's a hot semi-dry year, hemorrhagic, I mean, the flies just come out and harass the heck out of the deer, they get this disease and it's very often fatal. Really, really bad news. So he had really worked across the board. So, later when Rockefeller closed the Princeton branch, he had a little job on his farm there, he decided to leave and go to work for Merck in New Jersey. That did not last long. So, he returned to Rockefeller in Manhattan and he rented a right across from the institute, and lived that way. He later died from a pulmonary fibroma in 1966, and during his lifetime he had two serious illnesses. One was lymphocytic choriomeningitis, which would be a small, robotype disease, and also eastern equine encephalomyelitis. That's not one I ever wanna get. The human fatality rate, I believe, is 40 to 50% for eastern equine. So, he had plenty of neurons, so maybe he lost a few, I bet. But anyway, I'm sure it wasn't a pleasant experience. If you want embellish yourself with some reading, in the wake of the 1957 Asian flu, he wrote a review paper on it, and he used, he focused on three pandemics, and in his introductory paragraphs he discusses a little bit about the Asian flu, but he talks about the '19 episode and a couple in the 19th century, and uh... Many articles in that issue are dedicated to the Asian flu, which if you don't know, are, uh... Was seeded into the United States of America from Grinnell, Iowa. The presbyterian youth camp had a big conference there with over 1,700 people, and it was written up by me and veterinary heritage will get yourself a copy of this. I gotta plug myself here, I'm sorry. At any rate, what happened is a student from Davis went to a state conference, presbyterian, I guess, and you just can't trust those Calvicals, but anyway, uh... He had flu, and so he got there and it just spread like wildfire. And several of those teenagers were hospitalized in Vermont, and then everyone got on the buses, a few cars and trains, and fanned out over the rest of the country. That was in June. And what they did was infect their siblings when they got home, who then went to Valley Forge where 58,000 youngsters were at the Boy Scout National Jamboree. And that seeded the virus into the US in, really, by August and early September. It actually peaked in October, so by time they got the vaccine, got it ready to go, hell, it was too late. It just, it didn't do any good. So, that's reviewed in subsequent papers over in the Iowa Heritage if you'll care to take a look at it. Sir Christopher Andrewes was very close to Dick Shope, and, you know, they did part company on the lung worm theory. He made the comment that, look Dick, uh, basically the earth worm is not native to North America, and neither were pigs, and the swine virus just evolved, and almost overnight you're saying that these three are linked in a complex cycle? He just couldn't believe it, and Dick Shope gave him a can of earth worms to take back to England, and couldn't infect pigs there with them, so. It was controversial, but I can say with a fair degree of confidence that Doctor Shope adhered to that theory, and even though it was somewhat of a moot point as husbandry changes and what have you, but anyway here's kind of a touching tribute. He received many honors, he was elected to the American Philosophical Society and National Academy of Sciences. He got honorary degrees from the University of Utrecht, which was a DVM in that case, so, he could've been the reverse of KF Meyer, and then, I don't know, I was listed there. I contacted the dean here last week at the veterinary college. I would've bet next month's social security check against $5 that I asked the veterinary college to confirm an honorary DVM. They haven't. So, I was just crushed by learning that. So, he was uh, but the important one's on the bottom. That Lasker award is America's nobles, if you will, and a high proportion of people who get the Lasker award go on to get the Noble award. Here's a little trivia from an editorial of the Journal of the Veterinary Association, which a It says the second time this award has been given to a physician for contributions to the health of domesticated animals.

The previous recipient was Dr. Theobald Smith, who we visited about earlier in this talk. [Dr. Francis Peyton Rous (born 1879)] gave really a touching thing, he says, Dr., I don't know if he was, he might've been deceased by this time, I'm not sure. No, he was there, yeah. Dr. Shope's theme throughout his scientific life has been the meaning of animal diseases for mankind, though he would never say so. Yet not alone from this theme has he drawn his wisdom and strength. He knows human nature well. How does he value his fellow creatures including ourselves? Much as he does the lower animals, with understanding, indulgence, humor and love. So, as an epilogue, I just want to inventory the family. Of course, we've already talked about Richard and Helen Shope. They had four kids. Dick Jr. was a veterinarian that got a PhD in virology at the University of Minnesota, and that's where I roamed, because during my vet school days I'd see him smoking a small cigar and working on things. And his, he also, Dick Junior was enlisted in the Navy and became a pilot, and he just got his wings when the World War 2 ended, so he, I think, discharged and then he went to, all of them went to Port Wenn for their educations, because they had an inside track for admittance. And then Robert, who, like I say, he was a charismatic figure with I mean, people talk in reverational tones about him, and he really was an incredible abrovirologist, and sadly both of them are deceased. And Robert pretty much had pulmonary fibroma like his dad, and it somewhat affected Dick Jr., but he was, of course, older. The youngest of the family was Tom, the baby, he was an academic pediatrician. He went through the CDC EIS program about the same time I did. I think it was after me, but his whole was career in pediatric infectious disease with emphasis in virology. So that DNA from his daddy went into those three people. And Nancy was the equestrian wife of a Colorado rancher, and they lived happily ever after. Here's the family. I was gonna get that photoshopped out, but that's a neighbor girl, so-- And I decided, alright, I'll leave her in. But this is the Shope family about 1940, '49. But this is Nancy Shope, who gave me a lot of information, and this Dick Shope's mother Mary, and this is Dick Jr., a very tall guy, and that's Helen, and this is the baby of the family, Tom, who is that infamous pediatrician in Anarbor, and that's Robert, the very distinguished, and I think he even had a lung transplant at the end, it just didn't work out. And there's Dick, Dick Shope himself. And there's me and Dick Jr. We had gone to the Lexington restaurant, a good place to eat, it's been closed a few years but I heard it's re-opening. It ran at the avenue of Lexington and St. Paul. We had a nice dinner and a few libations to go with it. The server was gracious enough to photograph us. Just a great guy. These are references for your use, and all the references, the early references mentioned as well as these, I have PDFs, so you know, if, my email is ruscorrier, with one s, @yahoo.com. If you want a shortcut to the circuit, I can send you any one of them, send you all of them I guess. And, um, the... The one by Gert Williams is really neat, 'cause he talks about a lot of different scientists, but the one on Shope is just absolutely precious. Andrewes wrote a nice memoir for the National Academy of Sciences, and he does inventory all his publications by year. Just very, very nice. And then I, of course, I mentioned him in that thing as well. So, there it is. And my question right now, just being rhetorical, I don't wanna embarrass anyone, but I kind of have to end on a half-summary note. How do we remember Dick Shope at the University of Iowa? Can anyone tell me about a hall or a meeting room? A custodian closet named after him? We don't. And... In my naivety, I corresponded to President Sally Mason at the time about doing something, and really got nowhere, and I kinda read between the lines, and they'd like a lot of money. So I wrote to all the vaccine producers of influenza vaccine saying, hey, we're kind of passing the hat here, we'd like to make a request to Iowa to name under in honor of Dick Shope. Got nowhere. Well, I grew up, I mean I lived in Irvingdale, and when I first moved there, my next door neighbor, not next door, but the neighbor across the street down five homes, was John He once gave me a ride to work in a snowstorm, and his daughter once babysat for us, and... I thought, hey, I'm gonna get something named after Richard Shope. Well, I got the same thing. Anyway, I didn't think he wanted any money, but he just kinda couldn't be bothered. So, anyway, my challenge to you, it's a healthy challenge, that a lot of time has been under the bridge, and you're kind of tied with AMES at the veterinary college, which may be even be more appropriate that literally nothing is named in honor of this guy here. Just a remarkable person who plowed new ground, and like I say, he was right at the Nobel level in terms of all of his life's accomplishments, and he really was part of, as Tom Brokaw said, America's Greatest Generation. So, I believe that, to you, is a quite little challenge between us folks and if you could influence anyone and you wanna contact me for supporting information or what have you, I'd be happy to do that. I think we're about out of time, anyway. That's the substance of my formal remarks, and I would entertain a question or comment or two if I could be able to help. Yes, sir? -

[Audience Member] In your earlier slide, you mentioned the effectiveness of the polio vaccine. Is that before Salk and-- -

[Russell Currier] Both, by almost four-five decades at least

[Russell Currier] Both, by almost four, five decades at least.

[Audience Member] Why didn't anything happen after that? -

[Russell Currier] I don't know. I've never pursued it that much, but they had a vaccine that protective against, uh, in monkeys. But it took a long time, because you know it, it was a difficult vaccine to produce in primates in the first place, and then to make sure it was inactive. And then we got into problems with the so then even when did have the Salk vaccine, the laboratories was really primarily a veterinary group, but they latched onto this vaccine and got a big chunk of it out, and that's what really helped cement the epidemic intelligence service at CDC, under Dr. Alex Wagner. But I don't know what the problem was. And I would also say, you know, in terms of these memoirs though, the one by Sabin, Sabin comes to mind, and really they should call it the Kaprowski vaccine, but Sabin was old school, quote unquote, and they let him get the glory because these guys didn't want to be bothered with the press and everything, but... To Sabin's credit, he wrote a very touching memoir of... I'm trying to think of his name. KF Meyer. One of the things I forgot to mention as I was flipping through here, I gotta read this to you, I told you, since the polio question prounced me to it, this is a quite from Kaprowski who wrote this chapter on polio, but also edited a book entitled Micropunners, Then and Now. This is on page 146, one short paragraph, immunization travel, this is polio, of children in Sonoma Valley, California was made possible through active collaboration of Karl F Meyer, the director of the George Williams Hooper Foundation at the University of California. authority on infectious disease, Meyer had a veterinary degree from the University of Zurich, and an honorary degree from the College of Medical Evangelists in Yorba Linda. He liked to use his MD title and once after, and I told you the rationale for that, and once after presenting the results of our polio trials in California, a not-very-friendly member of the audience asked him, "Is it true, Dr. Meyer, that you are a veterinarian" "And not an MD?" It is true, answered Meyer. Are you sick? That ended the exchange. Anyhow... Boy, oh, yes sir. -

[Audience Member] Your slide said that he had honorary degrees at just a number of places, it said Iowa. Yet I wonder, was it University of Iowa or Iowa State that was-- - [Russell Currier] I'm sure it was here. I didn't research it, but, someone, if you wanna get back into the archival thing, then shoot me an email and let me know. Probably was a doctor of science, or something like that. But I uh... You know, you give these talks. I've had a horrendous week where I'm doing other work, too, so I just couldn't nail down every detail, but that was one I actually thought of, oh, I thought GoogleIowa, but I really didn't, and apologize for that. But, this is, in terms of great American scientists, this guy here was a giant. And when you figure what he accomplished, and Dick Shope, like KF Meyer, were not desk-type scientists, or bench-type scientists. They got out in the field. And one time they did a horse's head, and I think that was his first diagnosis for western equine encephalitis. He wanted, there was a horse ailing, and it wasn't gonna make it anyway, and he wanted to buy from the horse from the farmer and euthanize it and remove its head, and he wouldn't agree to it. He was talking to the farmers wife and he said, you know, when you go to bed tonight, he goes to sleep, raise the shade, or some, there was some signal he worked out with here, and soon as that happened, and he was smoking his pipe hiding out there in a ditch or something, he went in and he gavel think or something to horse, removed its head, threw it in a gunny sack and took it back to San Francisco. That was the type of guy KF was. Now, he was the same way. He just had to, he just had to dig up to his elbows in a puddle of guts on pigs and stuff like that, in working, getting samples. A good example, I talk to an old professor yesterday at AMES who said he was a graduate student, this was about '48, '49, or 1950, and it was a hot Summer in Iowa and there was a muskrat die-off, uh... And he was in the diagnosticthe only guy, it was just quiet, and he taking apart this, doing a necropsy on this muskrat. In walk this tall well-dressed guy who identified himself as Richard Shope, and he knew of course who he was. I mean at that point he knew who he was. And he says, "You mind if I look over your shoulder?" He says, no. So, there was some liver lesions there, and he says, this is from Bill Shweisser's, the veterinarian we're talking about, he wanted of that liver, do you mind if I take some samples and take it back? I'll give you a report. Which he did, and there was some factor, I don't fully understand, but it actually helped out later on with lesion errors diagnosis. So, just that type of remarkable guy. He'd go hunting and, you know, if there was a wart on that rabbit, he would study it. He was just that type of guy. This was a family that subsisted on two big things, the Shope family, one was wild game and the other was laboratory pork. He didn't throw all of those dead pigs away. He just removed the lungs and fed the family with the rest. He knew what he was doin'. You gotta be resourceful. Remember that $35 jalopy, you know, he had some lean early years, I'm sure, as he was starting his family and what have you, but he was an incredibly great human being, and all four of his children as well. And like I said, Robert had meeting her too, speaking, but I didn't. Didn't have any personal relationship. And then I corresponded with Nancy and Tom, the two youngers, and they, she said, we were really two families, because I can't remember my father until after World War 2. I was so young when he left, and then they come home and established that relationship. So, in your subconscious, I wanna bury that thought. Let's get something named after him, and I'll see what I can do over names with the College of Veterinary Medicine, 'cause it's long overdue. [...]

(2009) One Health Initiative website - "Remembering a Great One Health Physician Giant in History … Richard Shope, MD"

August 23, 2009 : Submitted by: Russell W. Currier, DVM, MPH, Dipl. ACVPMExecutive Vice President EmeritusAmerican College of Veterinary Preventive Medicine1864 NW 151 CourtDes Moines IA [...] / Source : [HI0034][GDrive]

Summary of Richard Edwin Shope Contributions to One Medicine/Health

Richard E. Shope MD (Dec 25, 1901 – October 2, 1966) was one of the pioneer microbiologists to investigate a variety of human and animal diseases and merits recognition for his many accomplishments that supported later research that continues to this very day. Dr Shope graduated from medical school at The University of Iowa in 1924 and immediately remained on staff there to teach pharmacology and work on the chemotherapy of tuberculosis. Shortly afterward he was invited to join the laboratories of the Rockefeller Institute at Princeton to work with Dr Paul Lewis, the discoverer of polio virus. **Subsequently in 1928, he left tuberculosis research to investigate hog cholera in the field where he observed his first outbreak of swine influenza.** Later research on influenza resulted in isolation of the virus from pigs and its co-pathogen Haemophilus influenzae suis, and subsequent research that

Later research on influenza resulted in isolation of the virus from pigs and its co-pathogen Haemophilus influenzae suis, and subsequent research that postulated that the swine virus was related to the human 1918 pandemic virus.

Dr Shope acknowledged the influence of the legendary [Dr. Theobald Smith (born 1859)], at the Rockefeller Institute, on his own career and observed that Smith "although possessed of great imagination and … uncanny foresight, was a meticulously methodical worker, who abhorred the waste of anything – time, material, or animals." This set a pattern for Shope's career and an informal distillation of his key accomplishments are summarized in the bullet form.

From Bernard Easterday, 4th Int'l Symposium on Emerging and Reemerging Pig Diseases, Rome June, 2003: "It remained for Shope to present the first reliable experimental evidence that influenza is caused by a virus (15). [Year 1931.] He demonstrated that he could reproduce swine influenza under strict experimental conditions by inoculating both filtered and unfiltered material from affected pigs into the respiratory tract of normal pigs. The disease produced by the filtered material was mild (later sometimes referred to as "filtrate disease") but it could be transmitted repeatedly in this manner. Subsequently, Shope would describe swine influenza as a "… disease of complex etiology, being caused by infection with the bacterium H. influenzae suis and the swine influenza virus acting in concert." Three years after Shope reported the viral nature of SI, Andrewes and Laidlaw (15) would report the viral nature of influenza in human beings. [Ref: Shope, RE 1964 Swine Influenza, In Diseases of Swine 2nd Ed. Ed by H.W. Dunne. P. 109-126.] Note: Shope and Christopher Andrewes became very good friends and Shope collaborated with the UK investigators on techniques to isolate virus which they subsequently did utilizing ferrets and Andrewes and co-investigators, Smith and Laidlaw, were later knighted for this accomplishment.

1936-1937. Shope postulated linkage between human and swine influenza. [Laidlaw also advanced same idea at same time.]

1941. Shope postulated linkage of "masked or occult" viral infection of pigs with swine lung worm and its intermediate host, earth worms. This was very controversial and was not entirely corroborated. The issue became a moot point as husbandry of pigs was changing that precluded importance of this postulated cycle. From Sir Chrotopher Andrewes biographical memoirs: "In 1930 Shope's attention was drawn to "mad itch" [aka pseudorabies], a violent distressing and fatal disease of cattle in the Midwest. He showed that it was caused by a virus transmissible to rabbits, and that it was endemic among pigs, in which it was comparatively harmless. Cattle contracted infection through contact with pigs. He finally proved the identity of cattle 'mad itch' with psedudorabies, a disease prevalent in parts of Europe. Later he studied another disease of pigs – swine pox – and showed that it could be, though it was not necessarily, transmitted through the agency of pig-lice. He also published evidence that hog cholera virus might persist, as swine flu virus appeared to do, in lungworms. Ref: Biographical Memoirs vol 50 (1979), p 353-375, © The National Academy of Sciences. Shope's three most outstanding discoveries followed each other in rapid succession: swine influenza in 1931, the rabbit fibroma in 1932, and rabbit papilloma in 1933." Andrewes again, "The work [masked rabbit papilloma virus studies by Shope] gained a new dimension when it was found that in many tame rabbits the warts progressed and became carcinomatous [sic]. This change, though common in domestic rabbits, was rare in cottontails. Shope at this time, was busy with many problems, so he generously gave the material to [Dr. Francis Peyton Rous (born 1879)]. What Rous did with the rabbit cancers during the next thirty years is a matter of history." [Peyton Rous received Nobel Prize for Medicine in 1966 for work demonstrating viral etiology of cancer.]

Viral etiology of cancer. Shope described papilloma in jack rabbits and the pathological condition bears his name "Shope papilloma [or fibroma]", and in urban legend mode affected bunnies were referred to as "jack-a-lopes." He prompted a colleague at Rockefeller Institute, [Dr. Francis Peyton Rous (born 1879)], to extend his inquiries to mammals. Rous had already demonstrated transmission in chickens but not mammals. **During WW II, Shope was attached to the US Army and detailed to a joint Canadian-US project on Grosse Isle in St Lawrence River to develop a rinderpest vaccine for cattle.** There was concern of biowarfare and deliberately introduced rinderpest would be a food production catastrophe. From Andrewes, "**Here Shope, with a staff of five other scientists, worked in strict isolation, and in the course of nineteen months produced an effective vaccine by growing and attenuating the virus in hens' eggs.** This has since been used on a large scale in the field." **Shope was then transferred back to the Navy. He was in first party to set up a lab to study tropical diseases on Guam and on Okinawa after assault began.** Shope was actually fired on. He found mold from Guam growing on photo of his wife Helen. He isolated a substance from this mold with in vivo antiviral properties and named it after wife "Helenine". Later found to be nucleoprotein that stimulated interferon production. Approximately two years after WW II: Shope developed an effective vaccine to a South American rabbit disease that was deliberately introduced to Great Britain to reduce population and extensive burrowing of rabbits in farm fields. Inadvertent introduction in France however resulted in decimated rabbit populations and adverse effect on commercial rabbitries. Shope's vaccine saved the rabbit industry in France. Circa 1950s: Shope isolated a second benign-tumor virus from deer. Also isolated the deer "hemorrhagic disease" virus. **Later when Rockefeller closed the Princeton branch, Shope decided to leave and go to work for Merck in Rahway NJ.** Subsequently he returned to Rockefeller in Manhattan [rented room during weekdays!] Later died from abdominal cancer October 2nd, 1966.

During lifetime had two serious viral diseases, lymphocytic choriomeningitis and eastern equine encephalomyelitis.

Andrewes, " Shope received many honors. He was elected to the American Philosophical Society (1944) and the National Academy of Sciences (1940). He received honorary degrees from the **universities of Utrecht, Rutgers, Giessen,** Chicago, Pennsylvania, Iowa, and Yale, as well as many prizes and awards.. [...]"

"On May 8, 1957, the Association of American Physicians awarded the Kober Medal to Dr Richard E Shope, the second time this award has been given to a physician for contributions to the health of domesticated animals. The previous recipient was [Dr. Theobald Smith (born 1859)]."

[See Harvard Magazine, July-August 2009] Dr Shope acknowledged influence of individuals on his career specifically Theobald Smith, who worked out arthropod transmission of disease and Paul Lewis who discovered/isolated polio virus and died of yellow fever while studying the same disease in South America. "Dr Shope then paid tribute to a veterinary practitioner, Dr Fred J. Crow of Iowa City Iowa, "who permitted me to spend … time with him in the field…and who guided me during my initial experience with swine influenza…He got me my first case of swine pox and … of pseudorabies and …served as the connecting link between the practicality of the field and science of the laboratory." Ref: JAVMA, Nov 15, 1957, p 486-487. The following excerpt is from the Souvenir Book published by the Eastern Iowa Veterinary Association on their 25th Anniversary (1913-1938). It was written by Richard E. Shope MD, of the Rockefeller Institute for Medical Research, Department of Animal and Plant Pathology, Princeton, New Jersey. "In the summer of 1928, I was in Iowa doing blood counts in hog cholera and other swine diseases with the cooperation of a number of veterinarians in eastern Iowa. During that time I had occasion to go to Ames to see Dr Charles Murray and it was he who first called my attention to the existence of swine influenza. Returning to eastern Iowa, arrangements were made with Dr Fred Crow for the collection of material from typical cases when the epizootic should appear during the autumn. Dr Crow telegraphed me on November 13 saying, 'Plenty of hog flu – come at once.' I took the first train west, and on arriving in Iowa City found that there was indeed plenty of 'hog flu.' Through the friendliness and cooperation of a number of eastern Iowa veterinarians and their clients, many swine autopsies were obtained and material from the best cases was shipped back to Princeton. At that time, because we had no idea as to how fragile or easily killed the causative agent might be, we packed our infectious material in iced thermos jugs and sent it by air mail from Cedar Rapids. After several unsuccessful attempts to establish swine influenza in our experimental pigs in Princeton with the various samples sent, one batch finally 'took.' This had been obtained by

Dr Crow on the Probst Brothers' farm near Iowa City. Dr Lewis, my chief, wired me of his success in establishing the disease experimentally and to return to Princeton as soon as possible." [...] Finally a quote from Dr Peyton Rous' on the occasion of conferring The Academy Medal to Richard E. Shope, M.D. at the Annual Meeting of The New York Academy of Medicine, January 7, 1965: "Dr Shope's theme throughout his scientific life has been the meaning of animal diseases for mankind, though he would never say so. Yet not alone from this theme has he drawn his wisdom and his strength. He knows human nature well. How does he value his fellow creatures including ourselves? Much as he does the lower animals – with understanding, indulgence, humor, and love." [...]

The Des Moines Register (Des Moines, Iowa) • 29 Jul 1925, Wed • Page 7

Miss Helen M. Ellis Weds Dr. Richard E. Shope

A quiet wedding took place yesterday morning at the home of Rev. F. O. Hanson, 712 Parnell avenue, when Miss Helen M. Ellis, daughter of Dr. and Mrs. A. D. Ellis of Lineville was united in marriage to Dr. Richard Edwin Shope, son of Dr. and Mrs. C. C. Shope of this city.

Immediately after the ceremony, which was witnessed by the immediate families of the bridal couple, a wedding breakfast was served at the home of the bridegroom's parents, 1202 Morton avenue.

At noon the young couple left by motor for Woman lake, Minn., where they will spend their honeymoon. They will visit in Des Moines before going to Princeton, N. J., where, after Sept. 1 Dr. Shope will become identified w[illegible] the research laboratory of Rockefeller institute.

The bride is the eldest daughter of Dr. and Mrs. Ellis and formerly attended Drake university. She later was a student at the State University of Iowa, was a member of Delta Zeta sorority and of the University Players.

Dr. Shope received his medical degree from the state university in 1924 and for the last year has been with the pharmacology department there.

He is a member of Phi Beta Pi, medical fraternity; Alpha Omega Alpha, honorary medical; Gamma Alpha, scientific; Sigma Xi, honorary scientific, and A. F. I., honorary senior organization at the university. During his senior year he was all-senior class president.

Veterinarians To Hear Research Man Discuss Hog Flu

The regular monthly dinner meeting of the Linn County Veterinary Medical association will be held at 6:30 p.m. Thursday at Hotel Montrose, Cedar Rapids. Dr. Richard E. Shope of the Rockefeller institute of medical research, Princeton, N. J., will discuss "Flu in Swine."

Discussion and reports on field experiments with hog flu also will be given by Drs. C. H. Banks of Tipton, W. C. Vollstedt of Dixon, F. J. Crow and J. S. Potter of Iowa City, J. H. Schrader of Oxford, Henry Hell of Wilton Junction, W. S. O'Brien of Ryan, and H. N. Strader of Marion.

Dr. L. F. Bacon of Cedar Falls will talk on "A New Disease of Dogs Occurring in Epizootic Form."

1934 (July) - injecting a "virus" causes illness, thus viruses are bad

SWINE MAY TRANSMIT FATAL STOCK DISEAS

Scientists Discover Hogs Have Pse dorabies in Very Mild Form

By Press Science Service

PRINCETON, N. J., July 28- Swine may be the reservoir fo pseudorabies, an acute, highly fata disease of cattle, cats and dogs, Dr Richard E. Shope has found from investigations made at the laboratories of the Rockefeller Institute fo Medical Research here.

The disease of cattle is caused b a virus. It can be given to rats rabbits, guinea pigs and other animals by injecting the virus into the animal, but how it spreads naturally has been something of a mystery.

Injecting the virus under the skin of these animals or swabbing it inside their noses produces the disease. But, unlike cattle, swine have a very mild form of pseudorabies and do not die of it. Scientists suggest, therefore, that the disease is naturally transferred from one animal to another via the nasal route The swine have the disease in such a mild form that the farmer may not recognize it or even may not know that any of his swine are sick

THE SUNDAY TIMES, NEW BRUNSWICK, N. J., SUNDAY, JULY 29, 1934.

Influenza Germ Reaction In Man and Swine Studied

Dr. R. E. Shope at Rockefeller Institute Hopes to Isolate Organisms; Studies Give Promise of Solving Disease and Attack It at Source

PRINCETON, July 28.—A study of the relationship between human influenza and a somewhat similar malady which attacks swine, now being carried on by Dr. Richard E. Shope at the Rockefeller Institute on the Brunswick Pike near here, gives promise of solving some of the problems which must be met before the dread disease can be attacked at its source.

These researches, begun in 1928 by Dr. Paul A. Lewis and Dr. Shope and continued by the latter alone since Dr. Lewis' death in 1930, have revealed clearly the close antigenic relationship between swine and human influenza, so close that it now appears probable that hogs may contract the malady from man.

It was Drs. Shope and Lewis who, in 1930, discovered that the incitant of this ailment in swine, unknown since the disease first appeared among hogs on the farms of the middle west during the human epidemic of 1918, was caused by the combined action of a filterable virus and a bacterium. The former being a disease-producing agent too small to be seen with even the most powerful of microscopes.

Agent Never Isolated

Since the agent causing human influenza has never been satisfactorily isolated, and since no cure for the disease, which periodically ravages the world, can be obtained until this is done, Dr. Shope's present effort to identify the human virus with that which attacks swine assumes major significance in the field of medical research.

During the great epidemic of 1889-1892, Dr. Richard Pfeiffer, then director of the scientific section of the institute for infectious diseases at Berlin and later professor of Hygiene and director of the hygienic Institute at Koenigsburg, discovered an organism, since known as the influenza bacillus, which had all the ear marks of being the cause of the disease.

Owing to the absence of a satisfactory experimental animal, however, the correctness of his views could not be tested until the second great epidemic of 1918-1920 arrived. Studies of the role played by the organism then led to inconclusive results, and as an outcome of the work of this period. Those who doubted the importance of the influenza bacillus hypothecated a filterable virus.

Dr. Shope has further found that the bacterial component of swine influenza is closely related to, if not identical with, the organism which in 1891 had been incriminated by Dr. Pfeiffer as the cause of the human epidemic, which naturally brings up the question on which he is now working—whether in human influenza as in the swine malady two agents, the second being a filterable virus, are necessary to induce the infection.

By studying the relationship of this hitherto mysterious disease in man to the naturally-occurring malady in hogs. Three English scientists have found other quite suggestive similarities between the two forms which may prove of fundamental importance in arriving at a definite conclusion of the problem of the cause and treatment of influenza in humans, and so halting the plague that has taken such a heavy toll of life throughout the world.

Drs. Wilson Smith, Charles H. Andrews and Patrick P. Laidlaw, pathologists to the Medical Research Council of the national institute at London, furnished with material on which to work by a small epidemic of influenza in England last year, have been able to demonstrate from the nasal washings of a number of cases a virus which was capable of producing a mild illness in ferrets. Their evidence strongly suggested that this virus was of importance as a cause of the human infection.

Trying to Isolate Virus

The British bacteriologists further found that the virus which is important as a partial incitement of swine influenza in this country would also infect ferrets, producing in these animals a disease very similar to that produced by the human virus. Their work suggested a further relationship between hog and human influenza in that ferrets recovered from the disease produced by the swine virus were no longer susceptible to infection with the human virus.

With the aid of these discoveries, Dr. Shope is continuing his efforts to isolate the human virus and compare it with the incitant of the swine malady. In his own words, his work "may result in some sensational discovery in the near future." For if the cause of the human disease can definitely be isolated and identified, a cure for it can be found.

Swine Are Carriers of Cattle Disease

PRINCETON, N. J. (S. S.)—Swine may be the reservoir for pseudorabies, an acute, highly fatal disease of cattle, cats and dogs, Dr. Richard E. Shope has found from investigations made at the laboratories of the Rockefeller Institute for Medical Research here.

The disease of cattle is caused by a virus. It can be given to rats, rabbits, guinea pigs and other animals by injecting the virus into the animal, but how it spreads naturally has been something of a mystery.

Following the discovery of a European investigator, S. Von Ratz, that pseudorabies occurs naturally in wild swine, Dr. Shope began studying the disease in relation to domestic swine.

But, unlike cattle, swine have a very mild form of pseudorabies and do not die of it. Dr. Shope suggests, therefore, that the disease is naturally transferred from one animal to another via the nasal route.

The similarity in the pathogenic properties of human and swine influenza virus for ferrets led Elkeles (1) to attempt the transmission of the human agent to swine. He found that very young pigs (2 to 6 weeks old), developed a mild illness when the virus from man was given intranasally under light ether narcosis. At autopsy these animals sometimes showed scattered dark red bronchopneumonic areas of consolidation in the upper lobes of the lung. When cultures of either swine or human influenza bacilli were added to the virus at the time of its administration, the swine developed a more severe illness. The clinical picture was characterized by a low grade fever, apathy, loss of appetite, and sometimes cough. At autopsy varying degrees of bronchopneumonia were encountered. Virus, pathogenic for ferrets, could be recovered from the pneumonic lungs. It thus appeared that Elkeles had produced a disease somewhat resembling swine influenza by the administration to young pigs of human influenza virus mixed with influenza bacilli of either human or swine origin. This observation made more credible the theory that swine influenza may have arisen as the result of the infection of swine in 1918 from human sources (2–4).

The question of the pathogenicity of human influenza virus for swine was of such importance that it seemed to warrant further investigation. The present paper reports our experience in the transmission of human influenza virus to swine.

The similarity in the pathogenic properties of human and swine influenza virus for ferrets led Elkeles (1) to attempt the transmission of the human agent to swine. He found that very young pigs (2 to 6 weeks old) , developed a mild illness when the virus from man was given intranasally under light ether narcosis. At autopsy these animals sometimes showed scattered dark red bronchopneumonic areas of consolidation in the upper lobes of the lung. When cultures of either swine or human influenza bacilli were added to the virus at the time of its administration, the swine developed a more severe illness. The clinical picture was characterized by a low grade fever, apathy, loss of appetite, and sometimes cough. At autopsy varying degrees of bronchopneumonia were encountered. Virus, pathogenic for ferrets,

could be recovered from the pneumonic lungs. It thus appeared that Elkeles had produced a disease somewhat resembling swine influenza by the administration to young pigs of human influenza virus mixed with influenza bacilli of either human or swine origin. This observation made more credible the theory that swine influenza may have arisen as the result of the infection of swine in 1918 from human sources (2 - 4).

The question of the pathogenicity of human influenza virus for swine was of such importance that it seemed to warrant further investigation. The present paper reports our experience in the transmission of human influenza virus to swine.

Experimental - The Infection of Swine with Human Influenza Virus Alone

The PR 8 (Francis (5)) and WS (Smith, Andrewes, and Laidlaw (6)) strains of the human influenza virus were used in our experiments. No diflqculty was encountered in establishing either strain in swine 6 to 14 weeks of age. Older or younger animals were not tried. All animals were inoculated intranasally using the same methods employed in earlier studies of swine influenza (7, 8). The instillations were made with a Luer syringe without needle by pressing the tip of the syringe into the external nares. It was not necessary to anesthetize swine in order to induce infection with human influenza virus alone, although animals infected under ether narcosis exhibited somewhat more extensive pulmonary lesions at autopsy than those inoculated without anesthetic.

The WS virus was transferred 2, and the PR 8 virus 5, serial passages in swine before the experiments were discontinued. 10 per cent suspensions of infected mouse lung (5, 9) in physiological saline served as the source of virus for the first swine inoculation in each of the passage series and, after the first swine passage, similar suspensions of infected swine lung were used to inoculate swine of subsequent passages. 6.5 cc. of virus suspension was administered to each animal.

The disease produced in swine by human influenza virus was clinically very mild and, apart from a transient and indefinite malaise, no constant symptoms

were observed. It was sometimes difficult to be certain on antemortem examination that the animals had actually been infected. In most cases there was no significant elevation in temperature though a few had fever on the afternoon of the day following inoculation. 4 animals were kept under observation for 3 weeks or longer and made uneventful recoveries. 8 others were killed either by stunning and bleeding or by chloroforming on the 3rd or 4th day after inoculation and these exhibited the following picture at autopsy. There was a scattered, patchy, lobular atelectasis of one or more of the anterior lobes of the lung (Figs. 1 and 2). On cut section the involvement about the bronchi was seen to be more extensive than was apparent from the uncut surface. The involved lung was a reddish purple in color, beefy in appearance, felt rubbery, and was moist. A rather scant glassy tenacious mucous exudate could sometimes be pressed from the cut bronchi.

Histologically in involved areas of lung the alveolar walls were folded, greatly thickened, and infiltrated with large numbers of mononuclear cells (Figs. 3 and 4). Capillaries in the alveolar walls were dilated and packed with red blood cells. The partially collapsed alveoli themselves were either free of cells or contained at the most an occasional desquamated epithelial cell or a few lymphocytes. Polymorphonudear leucocytes were conspicuously absent. There was a pronounced perlbronchial round cell infiltration. The bronchial epithelium was, in places, fragmented and partially desquamated, and the cilia were either denuded or badly matted together. Some bronchi contained a scant, mixed lymphocytic and polymorphonuclear leucocytic exudate. Lymph channels in the interlobular septa were sometimes dilated and the septa themselves thickened and loosely infiltrated with mononuclear cells.

The trachea, bronchi, and lungs of swine infected with human influenza virus were in most instances bacteriologically sterile. The few animals from whose respiratory tracts organisms could be cultivated showed no evidence that their disease had been modified by the bacterial contaminant.

Influenza virus was demonstrated in the lung lesions of all passage swine by the inoculation of mice (5, 9). No evidence was obtained that serial transmission of the virus in swine modified its pathogenicity for mice. Also, the pathogenicity of the virus for swine appeared to remain constant through the number of serial passages to which it was submitted. It was of interest that the areas of swine lung that appeared free of lesions were also free of virus.

The symptoms and pathology observed in swine infected with human influenza virus were indistinguishable from those of the filtrate disease (10) produced in swine by the intranasal administration of swine influenza virus alone.

The Infection of Swine with Human Influenza Virus and H. influenzae suis

Sixteen swine have been inoculated intranasally with mixtures of human influenza virus and the bacterium, H. influensae suis (11). These animals were included in two serial passage experiments. One series, started with virus from infected ferret lung (6), was continued for 5 passages, and the other, initiated with virus from infected mouse lung, was carried through 3 passages in swine before being discontinued. 6.5 cc. of 10 per cent virus suspension to which had been added 0.5 co. of a 24 hour horse blood culture (11) 1 of H. influenzae suis, strain 18, was given intranasally to each animal. It was known from other experiments conducted at the same time as those under discussion that this culture of H. influenzae suis, in combination with swine influenza virus, was capable of producing characteristic influenza in swine (10).

In 11 of the 16 swine inoculated with mixtures of human influenza virus and H. influenzae suis the resulting illness was definitely more severe than that caused by the virus alone. This enhancement was evident both clinically and at postmortem examination. The temperature reactions were similar to those seen in swine influenza although nsuaHy the fever was less persistent. Seldom was it maintained for longer than 3 days, whereas 5 to 6 day fevers are not uncommon in swine influenza. Fever, while it lasted, was high, exceeding 41°C. on 1 or [...]

[...]

Summary

Swine inoculated intranasally with human influenza virus alone develop an ill defined, mild, and usually afebrile illness of short duration. At postmortem the anterior lobes of the lungs of such animals contain scant, scattered areas of lobular atelectasis. Transmission of the virus for 5 serial passages through two groups of swine

failed noticeably to enhance its pathogenicity for this species. The disease produced in swine by infection with human influenza virus alone is indistinguishable clinically and pathologically from that caused by infection with swine influenza virus alone. Transmission of human influenza virus from swine to swine by contact succeeded in only one of four attempts.

Swine inoculated intranasally with a mixture of human influenza virus and H. influenzae suis usually develop a febrile, depressing illness similar to mild swine influenza. The pneumonia encountered in such animals at autopsy is similar to but less extensive than that seen in swine influenza. In some animals H. influenzae suis fails to become established and the disease then seen is identical with that caused by human influenza virus alone.

The human influenza virus recovered after 5 serial transfers in swine was immunologically the same as that with which the experiments were begun.

THE BOSTON GLOBE
...RSDAY, NOVEMBER 12, 1936

Virus and Bacteria Seen Cause of "Flu" in Man

Scientist Finds Possibility Great 1918 Epidemic Had Origin in Disease of Swine

NEW HAVEN, Nov 11 (A P)—The breaking down of the cause of influenza to what appears to be two agents—bacteria and a filtrable virus—was announced tonight by Dr Richard E. Shope of the Rockefeller Institute for Medical Research.

Dr Shope told the Yale Medical Society that recent experiments convinced him the disease apparently is produced by the concerted activity of these two agents.

The question as to the cause of influenza has been highly controversial for some time. Dr Shope terms his conclusions "newer knowledge of influenza." He pointed out, however, "proof of his theory must await future widespread outbreaks of the disease."

The physician told of studies he had made with Dr Paul A. Lewis on a disease of swine which appeared for the first time in 1918 and, because of its marked similarity to human influenza, was called "swine influenza."

Agents Act Together

Dr Shope said Dr Lewis and he had found that the disease had a "complex etiology, that is, it was produced by the concerted activity of two agents—bacterium, similar in all respect to the earlier discovered germ, and the other was a filtrable virus different from any previously encountered."

"It was this work," pointed out Dr Shope, "that suggested the possibility that human influenza might have a similar complex origin. The thing lacking, so far as the human disease was concerned, was the demonstration of a filtrable virus. This was provided in 1933 when Smith, Andrewes and Laidlaw in England found that the filtered nose and throat washings from cases of human influenza contained a virus which was capable of infecting ferrets and mice.

"Other strains of an identical virus were isolated in Puerto Rico and Philadelphia."

Viruses Not Alike

Dr Shope said:

"This new human virus and swine influenza were found to cause identical disease pictures in ferrets and mice. The two agents were, however, serologically different. Evidence obtained in neutralization experiments with the sera of human blood suggested that the human virus was a widespread infectious agent. They further demonstrated that the swine virus had also, at some time in the past, infected man.

"The theory has been advanced that the swine virus represents the surviving prototype of that responsible for the 1918 pandemic influenza in man. The swine virus, however, appears to be no longer pathogenic for man and proof of the theory must await future widespread outbreaks of the disease. There is no way of telling, as yet, whether human influenza is a pure virus infection, or whether, like the swine disease, both the virus and a bacterium are esential to its causation."

Shope papilloma virus

Virus classification

(unranked): Virus

Realm: Monodnaviria

Kingdom: Shotokuvirae

Phylum: Cossaviricota

Class: Papovaviricetes

Order: Zurhausenvirales

Family: Papillomaviridae

Genus: Kappapapillomavirus

Species: Kappapapillomavirus 2

Synonyms[1]

- Rabbit papilloma virus
- Rabbit (Shope) papilloma virus
- Cottontail rabbit papillomavirus (Shope)
- Cottontail rabbit papillomavirus

The Shope papilloma virus (SPV), also known as cottontail rabbit papilloma virus (CRPV) or Kappapapillomavirus 2, is a papillomavirus which infects certain leporids, causing keratinous carcinomas resembling horns, typically on or near the animal's head. The carcinomas can metastasize or become large enough to interfere with the host's ability to eat, causing starvation. Richard E. Shope investigated the horns and discovered the virus in 1933, an important breakthrough in the study of oncoviruses. The virus was originally discovered in cottontail rabbits in the Midwestern U.S., but can also infect brush rabbits, black-tailed jackrabbits, snowshoe hares, and European rabbits.[2]

History

Richard Edwin Shope discovered the Shope papillomavirus

In the 1930s, hunters in northwestern Iowa reported that the rabbits they shot had several "horn" protrusions on many parts of their bodies including their faces and necks.[3] The virus is also a possible source of myths about the jackalope, a rabbit with the horns of an antelope, and related cryptids such as the wolpertinger. Stories and illustrations of horned rabbits appear in scientific treatises dating back many years, such as the Tableau encyclopédique et méthodique, from 1789.

The Iowa reports led cancer researcher Richard E. Shope to investigate, and he discovered the virus in 1933.[4] He separated the virus from horny warts on cottontail rabbits, and made one of the first mammalian tumor virus discoveries.[4] Shope determined the protrusions were keratinous carcinomas due to the infection of CRPV. Shope's research led to the development of the first mammalian model of a cancer caused by a virus. He was able to isolate virus particles from tumors on captured animals and use these to inoculate domestic rabbits, which then developed similar tumors. This has contributed to our understanding of fundamental mechanisms in neoplasia, or the formation of a new, abnormal growth of tissue.[4] The virus was sequenced in 1984, showing substantial sequence similarities to HPV1a. It has been used as a model for human papillomaviruses both before and after this discovery. The most visible example of this role is the HPV vaccine, which was developed based on and incorporating research done using the virus as a model. Similarly, it has been used to investigate antiviral therapies.

Genome

There is a lack of specific data about the reproductive cycle of papillomaviruses. Research is not conclusive about which coding regions are expressed before or after replication of viral DNA. The E1 region should carried the DNA required for cis and/or trans. E1 is the largest Open reading frame, which is the set of codons in the genome that code for proteins, encoding a 602 base protein. E1 is similar to COOH-terminal domain of the Simian virus 40, plays a role in viral DNA replication maintaining plasmids within a cell. Results have found that CRPV and BPV1 are found in the same location of the genome, which indicates that papillomaviruses likely have similar methods of replicating their genomes outside of a chromosome. A notable difference between the genomes of the four strains is that the E6 protein is almost twice as long in the CRPV as in any of the other strains of papillomaviruses. The E6 protein is somewhat homologous with a family of ATP syntheses that are found in mitochondria of cattle. The homology is significant enough to imply an evolutionary relationship between E6 and the beta chain of the ATP synthase family; however, they do not have the same function or enzyme activity. The E2 protein overlaps with the E4 open reading frames in the other papillomaviruses. These differences in the E2 proteins likely determine how oncogenic a virus is. The noncoding region has a homologies with BPV1. Other homologies exist, such as the fact that all papillomaviruses have repeated sequences in the noncoding parts of their genomes. CRPV has some notable repeats, some as long as 32 base pairs. Many pairs up stream of the transcription locations are homologous with promoter sequences in of SV40.[5]

Life cycle

Replication cycle and transcription

The papillomavirus life cycle begins with cells actively multiplying in epithelial cells of basal and parabasal layers. The differentiation of these cells is necessary for this virus to complete its life cycle. Transforming proteins E6 and E7 induce the S-phase in the lower epithelial layers.[6] Viral replication proteins E1 and E2 are also required to form the papilloma and keep the episomal viral genome replication low. Genome amplification will be restrained until viral replication proteins increase and several viral proteins are co-expressed. The infected, differentiating cells travel towards the epithelial surface during the viral cycle's late stage. In the upper epithelial layers, the promoter activity is altered during the virus' production. E4 proteins are expressed, and viral DNA amplification starts in the differentiated cells. Following this, the L1 and L2 viral capsid proteins are expressed and the infectious virions begin to assemble.[7]

Expression of the papillomavirus E4 protein correlates with the onset of viral DNA amplification. Using a mutant cottontail rabbit papillomavirus (SPV) genome incapable of expressing the viral E4 protein, it has been shown that E4 is required for the productive stage of the SPV life cycle in New Zealand White and cottontail rabbits.[6]

Assembly and release

The virus particles are assembled in the upper epithelium. The virus capsomere icosahedral shell is packaged with an 8000 base pair genome, 360 L1 protein copies, and 12 copies of L2 proteins inside. L2 proteins gather at PML body nuclear structures and recruit L1 proteins during virus assemblage. L2 proteins are not necessary for assemblage, but it is possible that they augment packaging and infectivity. Capsid proteins have been thought to also gather at the PML bodies during packaging.[6]

Transmittance of the Papillomavirus requires release from the infected skin cell at the epithelial surface, as they are non-lytic. They are resistant to desiccation, enhancing their survivability during extracellular transfer between hosts. Cornified squame release from the surface of epithelial cells may also contribute to their survival. Immune detection of the virus in the host may also be hindered by antigen retention until the virus reaches upper epithelial cells.[6]

Modulation of host processes

When Richard E. Shope began his research on SPV, little was known about the natural transmission of the virus vectors and interactions of the virus on its hosts. In the lab setting, Shope worked with the virus' natural host, the cottontail rabbit.[4] Particularly, he worked with the cottontails of Iowa and other western states of the United States. He worked with these species because it was discovered that SPV had a restricted geographic range and was confined to the high plains of the western United States.[4] Therefore, the major host species of SPV is the cottontail rabbit of the western United States. Cottontail rabbits in Shope's lab usually were infected with the virus through parasites such as rabbit ticks.[4] When infected with SPV, hosts develop papillomas on hair-bearing skin, usually around the face and neck.[4] Shope found through his research that rabbit epidermal cell transformation by SPV requires interaction with mesenchymal cells. It was further found that mesenchymal types support papillomatous transformation.[4] Shope's research also investigated how vitamin A deficiencies or excess might affect host susceptibility to SPV. Shope found that deficiencies in vitamin A did not affect the relative growth of the papillomas, but in cases where there was excesses of vitamin A Shope papillomas were inhibited.[4] Therefore, when SPV infects a host, vitamin A plays an important role in the host/virus interactions.

Location in the host

Fluorescent antibody study identified the locations of viral antigens in wild rabbit papillomas. They were present only in the nucleus of keratohyaline and keratinized layer cells, and not deeper down in proliferating epithelial cells. In domesticated rabbits, the viral antigens were present in much smaller quantity in only superficial, keratinized layers. The investigation proposed that the virus is only present in proliferating cell nuclei during early development, containing a deficient amount of proteins and mostly nucleic acid. The proteins may be immunologically specific in order to keep its transmissibility, making it a masked virus.[8]

Associated viruses

Most homologous papillomaviruses are actually CRPV and HPV1a. This is possibly because both of these viruses target the skin. From an evolutionary perspective, CRPV and HPV1a could have diverged recently, or they could have converged due to their similar target. CRPV is a member of the papillomaviruses so it is related to all viruses in this family.[5]

Tropism

Infection of a rabbit's follicular cell, often occurs in locations including ears, nose, eyelids, and the anus. The infection first appears as a red and swollen area on the skin, followed by development of circular papilloma warts and keratinized horny warts. Although transmission between rabbits is high, the tumors themselves do not contain the infectious virus. 25% of Papilloma infections become malignant and form squamous cell carcinoma. Metastases can form in the lungs and lymph nodes, and if it advances further, can develop in the kidneys and the liver.[2]

Rabbit Papilloma displays tropism for the cutaneous epithelium. Warts are made up of nearly homogenous vertical tissue strands. Their outer coloration is typically black or greyish, and cut sections are usually white or pinkish white with a flesh-like center. Dark coloration is due to abundant melanin pigment. The warts are made up of several tight, branching, threadlike epidermis processes connected by narrow tissue cores. These growth structures indicate that the growth occurs simultaneously at several different centers, causing the surrounding tissue to bulge from the growth's lateral pressure. The normal epithelium abruptly transitions into a narrow zone of rapidly thickening epithelial layers, made up of rapidly multiplying cells.[3]

Rabbits re-infected with the virus exhibit some or complete immunity, and can transmit the virus to other wild rabbits, and from wild to domestic rabbits. A domestic strain cannot transmit it to another domestic rabbit, however.[3]

Immunologically, the papillomatosis virus is not related to fibroma or myxoma in rabbits.[3]

Source - [HK006S][GDrive]

Robert Ellis Shope (February 21, 1929[1] – January 19, 2004) was an American virologist, epidemiologist and public health expert, particularly known for his work on arthropod-borne viruses and emerging infectious diseases. He discovered more novel viruses than any person previously, including members of the Arenavirus, Hantavirus, Lyssavirus and Orbivirus genera of RNA viruses. He researched significant human diseases, including dengue, Lassa fever, Rift

Valley fever, yellow fever, viral hemorrhagic fevers and Lyme disease. He had an encyclopedic knowledge of viruses, and curated a global reference collection of over 5,000 viral strains. He was the lead author of a groundbreaking report on the threat posed by emerging infectious diseases, and also advised on climate change and bioterrorism.

Biography

Born in 1929 in Princeton, New Jersey, Shope was the son of Richard E. Shope, also a prominent virologist.[2][3] His brothers, Richard E. Shope, Jr and Thomas C. Shope, were also virologists.[4] Shope attended Cornell University, where he gained a BA in zoology (1951) and an MD (1954).[2][3][5] After an internship at Yale School of Medicine, Shope joined the U.S. Army Medical Corps and served for a total of three years at Camp Detrick in Frederick, Maryland and then at the U.S. Army Medical Research Unit in Kuala Lumpur, Malaysia. He subsequently joined the Rockefeller Foundation and – after a year studying with Max Theiler in New York – he was posted to Belém, Brazil, at the foundation's International Virus Program, where he spent six years, rising to direct the institute.[2][5][6]

Returning to the US in 1965, Shope joined the recently established Yale Arbovirus Research Unit (YARU) at Yale School of Medicine with other virologists from the Rockefeller Foundation. Initially an associate professor, he rose to direct the unit for 24 years.[2][5][6][7] Shope also headed the university's Division of Infectious Disease Epidemiology.[5] After his retirement from Yale in 1995, Shope and his colleague Robert B. Tesh moved to the University of Texas Medical Branch at Galveston, Texas, where they founded a new arbovirus centre.[3][5][6][7][8] Shope subsequently held the university's John S. Dunn Distinguished Chair in Biodefense.[1][5]

Research

Transmission electron micrograph showing dengue virions, one of many arboviruses Shope researched

The virologist Charles H. Calisher described Shope as a "walking encyclopaedia on the arbovirus catalogue,"[1] and during his career Shope contributed to the discovery of hundreds of novel viruses[3][5] – more than any person previously.[2][9] His research encompassed not only the areas of virology, tropical and emerging infectious diseases, but also epidemiology, vector biology and public health.[2] Calisher and emerging infectious disease specialist C. J. Peters highlighted his multidisciplinary approach, stating that "He brought the virus community together and served as a bridge between classical arbovirology and many other disciplines" including ecology, genetics and structural biology.[10] Epidemiologist and emerging infectious disease specialist Stephen S. Morse considered Shope to exemplify the approach of "integrating the laboratory and the epidemiological and being able to think broadly about the evolutionary issues as well as the specifics."[1]

Shope initially studied the Australian disease then known as "epidemic polyarthritis" with S. G. Anderson, showing that it was caused by an alphavirus, later characterised as Ross River virus.[2] His interest in infectious diseases was stimulated by his military service in Malaysia, where he investigated fevers among army personnel and locals.[2][6] During his time in Brazil in the early 1960s, he characterised over fifty different arboviruses (viruses transmitted by arthropods) including Guama and Oropouche viruses, many previously unknown. He also studied the viruses' vertebrate reservoirs, including birds, marsupials and rodents.[2]

Later that decade while at YARU, he characterised novel arboviruses from birds in Egypt. In 1969, his research turned to outbreaks of Lassa and yellow fever in Nigeria. The following year, with Frederick A. Murphy, he discovered Duvenhage, Lagos bat and Mokola viruses, which were the first viruses shown to be related to rabies. He characterised Thottapalayam virus, later shown to be the first hantavirus, from an Indian shrew in 1971. With Murphy and others, he discovered multiple viruses related to bluetongue, including bluetongue 20 virus, the first bluetongue-like virus from Australia.[2] In the late 1970s, with Jim Meegan, he showed that Rift Valley fever virus – previously believed to be restricted to sub-Saharan Africa, and mainly to infect livestock – was the cause of an epidemic in Egypt in which around 200,000 people were infected.[2][11] With Allan Steer, he was the first to describe Lyme disease, a tick-borne bacterial disease, in the US. He subsequently worked on viral hemorrhagic fevers, discovering Sabiá and Guanarito viruses, the causative agents of Brazilian and Venezuelan hemorrhagic fevers.[2] He also researched dengue and its vaccines.[1][2]

During Shope's time at Yale, YARU became the global repository for arboviruses.[7][8] When he and Tesh moved to University of Texas Medical Branch in 1995, they brought the arbovirus collection – consisting of more than 4,000 strains of arbovirus and more than 1,000 other viral strains, as well as reagents such as antibodies – with them.[2][3][5][7][8] The collection is used by scientists internationally to identify virus strains.[7][8] At Galveston, Shope widened his focus to include bioterrorism, winning $3.7 million in funding to develop measures to counter the threat. His group identified alphavirus, arenavirus and flavivirus as potential bioterrorist risks, and Shope worked with structural biologist David Gorenstein to develop new small-molecule antivirals targeted against these viruses.[1][2][3][7]

Public health and advisory work

> The medical community and society at large have tended to view acute infectious diseases as a problem of the past. But that assumption is wrong. We claimed victory too soon.
>
> — Robert Shope (1992), [1]

Shope led a high-profile investigation, with Joshua Lederberg and Stanley Oaks, into the risks posed by emerging infectious diseases and the measures necessary to respond to them for the Institute of Medicine. The findings were published in 1992 as Emerging Infections: Microbial Threats to Health in the United States, with Shope as the principal author, and the publication was swiftly recognised as groundbreaking. It suggested that the success of vaccines and antibiotics had led to the threat of infectious diseases being underestimated.[2][3][12][13] Shope stated at the press conference announcing the report's publication: "The medical community and society at large have tended to view acute infectious diseases as a problem of the past. But that assumption is wrong. We claimed victory too soon."[1] The report was important in improving the detection of infectious diseases in the US, and has been credited with stimulating renewed global interest in the area.[2][3][12][13] Shope continued to advise the US government on the topic later in the 1990s, and contributed to the establishment of American and international surveillance programs for infectious diseases including ProMED.[1]

Shope was one of seven scientists to brief Bill Clinton and Al Gore in 1997 on the effects of climate change, warning that the range of mosquitoes and other arthropod vectors would increase, affecting the prevalence of dengue, malaria and other infectious diseases.[2][3] He also served on the WHO Expert Panel on Virus Diseases and the International Committee on Taxonomy of Viruses, as well as numerous committees and expert panels for US national bodies including the Institute of Medicine, National Institutes of Health and National Research Council.[2] He was one of the co-editors of Fields Virology, the "definitive" virology text.[2]

Personal life

Shope was married to Virginia; the couple had two sons (Peter and Steven) and two daughters (Deborah and Bonnie). He had idiopathic pulmonary fibrosis, for which he received a lung transplant in December 2003. He died the following month in Galveston, from complications from the operation, at the age of 74.[2][3]

Societies, awards and honours

Shope served as president of the American Society of Tropical Medicine and Hygiene (ASTMH) in 1980.[2][14] He was awarded the society's Bailey K. Ashford Medal (1974),[15] Richard M. Taylor Award (1987)[16] and Walter Reed Medal (1993).[17] In 2005, ASTMH established the Robert E. Shope International Fellowship in Infectious Diseases in his memory.[9] The University of Texas Medical Branch named its biosafety level 4 laboratory, completed just before his death, The Robert E. Shope, M.D. Laboratory, and also set up a fellowship in his memory.[2][18] A symposium was held in his honour on March 18–21, 2004.[10]

2004-01-23-nytimes-robert-shope-74-virus-expert.pdf

By Stuart Lavietes / Jan. 23, 2004

Dr. Robert E. Shope, an expert on viruses who was the principal author of a highly publicized 1992 report by the National Academy of Sciences warning of the possible emergence of new and unsettling infectious illnesses, died on Monday in Galveston, Tex. He was 74.

The cause was complications of a lung transplant he received in December, said his daughter Deborah Shope of Galveston. Dr. Shope had pulmonary fibrosis, a disease of unknown origin that scars the lungs.

A professor of epidemiology at Yale for 30 years, Dr. Shope contended that the growth of world population, rapid international travel and the development of drug-resistant microbes and pesticide-resistant insects made worldwide epidemics more likely.

In his report, he also said health officials in the United States had grown complacent, believing that antibiotics and vaccines had conquered infectious diseases.

"We're vulnerable to something along the line of the 1918-1919 influenza pandemic that killed 20 million people worldwide," Dr. Shope said at a news conference announcing the report. "It's happened once; it can happen again."

The report recommended the development of a worldwide surveillance system to detect new diseases and prevent them from developing into epidemics. Had such a system been in place in the 1980's, Dr. Shope said, the spread of AIDS might have been limited.

The report's findings were also published as a book, "Emerging Infections: Microbial Threats to Health in the United States" (1992). Edited by Dr. Shope, Dr. Joshua S. Lederberg, a Nobel laureate, and Dr. Stanley C. Oaks Jr., it has become a standard reference on the topic.

The report also helped bring about a stronger network of disease detection laboratories in the United States, some authorities said. But, despite the World Health Organization's containment of SARS last winter, the worldwide system envisioned in the report, with laboratories conducting research in areas that have historically produced new viruses, has not been put into place, said Dr. Robert Tesh, a longtime colleague of Dr. Shope.

Dr. Shope, who received his undergraduate and medical degrees from Cornell, developed an expertise in viruses transmitted to people and domestic animals by rodents, mosquitoes and other biting, stinging insects. He helped discover hundreds of viruses, conducting investigations in Malaysia as an Army medical officer and in Brazil for the Rockefeller Foundation. At Yale, he led or participated in investigations of Rift Valley fever, Lassa fever, Venezuelan hemorrhagic fever and other diseases.

Working with Dr. Tesh, Dr. Shope also built the World Reference Center for Emerging Viruses and Arboviruses, a collection of some 5,000 samples.

Dr. Shope and Dr. Tesh joined the faculty of the University of Texas Medical Branch in Galveston in 1995, bringing the collection of viruses with them.

In 1997, Dr. Shope was invited to the White House with six other scientists to brief President Bill Clinton on global warming, which Dr. Shope said could accelerate the spread of infectious diseases because more germ-carrying mosquitoes would thrive in the warmer climate.

In the last two years, Dr. Shope worked on a Defense Department project to develop antidotes to viral agents that terrorists might use.

Robert Ellis Shope was born in Princeton, N.J., and grew up as a neighbor of Albert Einstein.

In addition to his daughter Deborah, Dr. Shope is survived by his wife, Virginia Shope, of Branford, Conn.; another daughter, Bonnie Rice of Belmont, Mass.; two sons, Peter and Steve, both of Newfields, N.H.; two brothers, Tom, of Ann Arbor, Mich., and Richard, of Hudson, Wis.; a sister, Nancy FitzGerrell of Boulder, Colo.; and six grandchildren.

1957 (Sep 13) - Becomes US citizen

Full page - [HN00TC][GDrive]

Two Here Become U. S. Citizens

1957-09-13-the-marshall-news-messenger-texas-pg-6-b-clip-us-citizens

Dr. Dieste and C. N. Sibley Take Allegiance at Ceremony in Tyler

Two Marshall citizens joined some 170 million persons as citizens of the United States this week in a short ceremony in Judge Joe Sheehy's federal district court in Tyler.

Taking the allegiance of citizenship was a Marshall doctor and a retired fruit company employe.

The doctor, Antonio Dieste, lives at 2105 S. Garrett with Mrs. Dieste and three children and is chief surgeon at the Texas and Pacific Railway Employes Association hospital on W. Houston.

Dr. Dieste has been living in Marshall since 1951 and has been a resident of Texas since 1948. He is originally from Tampico, Mexico, and lived in Corpus Christi before moving to Marshall.

AMERICAN ALL TIME

Dr. Dieste said he was happy to actually become a citizen but that he felt he had been an American all the time.

Before coming to Marshall, he was surgical chief resident at Memorial Hospital in Corpus Christi. He received his BS and MD degrees at the University of Mexico Medical School, Mexico City.

Also taking the oath of citizenship was Charles Noel Sibley who came to Marshall three and one-half years ago.

Mr. Sibley, who lives with Mrs. Sibley and five children at 1309 Mobile, is retired from the United Fruit Co. A native of Jamaica, British West Indies, Mr. Sibley worked for the company for 39 years.

He said he spent most of his younger years in Central America working his way up through the company's "ranks" to become superintendent of material and supplies.

LIFE DIFFERENT

He explained that life in the United States is quite different from Life in Central America. "We saw many revolutions," he said. He said that one day the leaders of an uprising would be called rebels and the next day they would be the federal government.

He chose America after spending many vacations here. "I decided that when I retired I would settle in the United States. That became an ambition," he said.

Mr. Sibley met his wife while on a vacation trip in Santa Fe, N.M., in 1950.

They both say they wouldn't live anywhere else.

LEGAL NOTICE

THE STATE OF TEXAS

TO: Z. T. DAWSON, MARY ANN FOREMAN, TOMMIE BRYANT, JAMES DAWSON, EMMA DEAN, BESSIE GRANT, LILLIE BELL EVANS, ROBERT NICKERSON, JAMES EVANS, JR., and EMMA EVANS.

GREETING:

You are commanded to appear by filing a written answer to the Plaintiffs' Third Amended Original Petition at or before 10 o'clock A.M. of the first Monday after the expiration of 42 days from the date of issuance of this Citation, the same being Monday the 28th day of October, A. D., 1957, at or before 10 o'clock A.M., before the Honorable District Court of Harrison County, at the Court House in Marshall, Texas.

Said Plaintiffs' Third Amended Original Petition was filed on the 5th day of September, 1957.

The file number of said suit being No. 19,834.

The names of the parties in said suit are: Wilson Hart and wife, Essie Hart, as plaintiffs, and Mattie Heath and husband, Albert Heath; Margaret Dawson, a feme sole, David Dawson, Lola Riley, a feme sole, Lula Fagan and husband, Son Fagan; Willie Reed, Velma Reed, Cris Dawson Davis, A. W. Langston, Lessie B. Alonzo and husband, George Alonzo; Z.T. Dawson, Lewis Hart, Lillie Bell Evans, Adam Evans, Mary Ann Foreman, Tommie Bryant, Silvia Foreman, and husband, John Foreman; Milo Dawson II, Jim Hart, John Henry Dawson, James Dawson, Emma Dean, a feme sole, Harrison Dawson, Maggie H. Jones, a feme sole, Bessie Grant, Charity Hart Sterling and husband, David Sterling, C. M. Pope, Jr., Humble Oil & Refining Company, a corporation; Robert Nickerson, Claude Bateman, Jr., James Evans, Jr., Emma Evans; Trice Production Company, a corporation; Hayward Hart, Betharene Riter and husband, Riter; Lewis L. Hart, Shirley Jean Hart, a feme sole, Lola May Hart, a feme sole, Gracie Lee Jackson and husband Jackson; Louise Riter and husband, Riter; and Dorothy Jean Riter and husband, Riter, as Defendants.

The nature of said suit being substantially as follows, to wit:

This suit is in the nature of a trespass to try title, wherein Wilson Hart and wife, Essie Hart, are the owners of the following described tract of land in Harrison County, Texas, to-wit:

Being the South 73 acres, more or less, of a 120 acre tract of land in the M. Lindsey Survey, Abst. 393, and the Wm. Tipton Survey, Abst. 712, and being the same 120 acres of land conveyed by James Wightman to David Lester, by deed dated 3-2-1877, recorded in Vol. 9, at page 93 of the Deed Records of Harrison County, Texas, situated in the SWC of a 565 acre survey made for Mary Wightman, by virtue of deed from J. J. Craven, dated in 1852, being out of the SWC of the M. Lindsey Survey, and extending to the SBL of the Wm. Tipton Survey, and having for its boundaries the following identified lands:

Bounded onthe East by a 140 acre tract sold to Alfred Johnson;

Bounded on the North by a 100 acre tract of land sold to Lyman Hawood;

Bounded on the South by the South Boundary line of the Wm. Tipton Survey, Abst. No. 712;

Bounded on the West by the WBL of the said 565 acre survey;

and were the owners and entitled to the possession of said tract of land on the 1st day of January, 1957.

That on or about the 1st day of January, 1957, the defendants unlawfully entered upon said premises and ejected and dispossessed plaintiffs of such premises, and are now unlawfully withholding the possession of said premises from the plaintiffs.

Plaintiffs further allege that they have claimed the land above described under deed duly registered, they have had and held peaceable and adverse possession of the land and tenements above described, cultivating, using and enjoying the same, and paying all taxes thereon, for a period of more than five years after defendants' cause of action accrued, if any, and before the commencement of this suit; and this they are ready to verify.

Plaintiffs further allege that they have claimed the land above described, and have had and held continuous, peaceable and adverse possession of said land, cultivating, using and enjoying the same for the period of more than ten years after the defendants' cause of action accrued, if any, and before the commencement of this suit, and this they are ready to verify.

Wherefore, premises considered, plaintiffs pray that the defendants be cited to appear and answer herein; that on final hearing of this suit, plaintiffs have and recover of and from the defendants the right, title and interest which is asserted by said defendants, that plaintiffs have a writ of possession; that writ of restitution issue; that plaintiffs recover all costs of suit, and for general relief.

If this Citation is not served within 90 days after the date of its issuance, it shall be returned unserved.

Issued this 10th day of September, A.D. 1957.

Given under my hand and seal of said Court, at office in Marshall, Texas, this the 10th day of September, A. D. 1957.

JACK A. MOORE, Clerk
District Court Harrison County, Texas
By: PATTY GREER Deputy

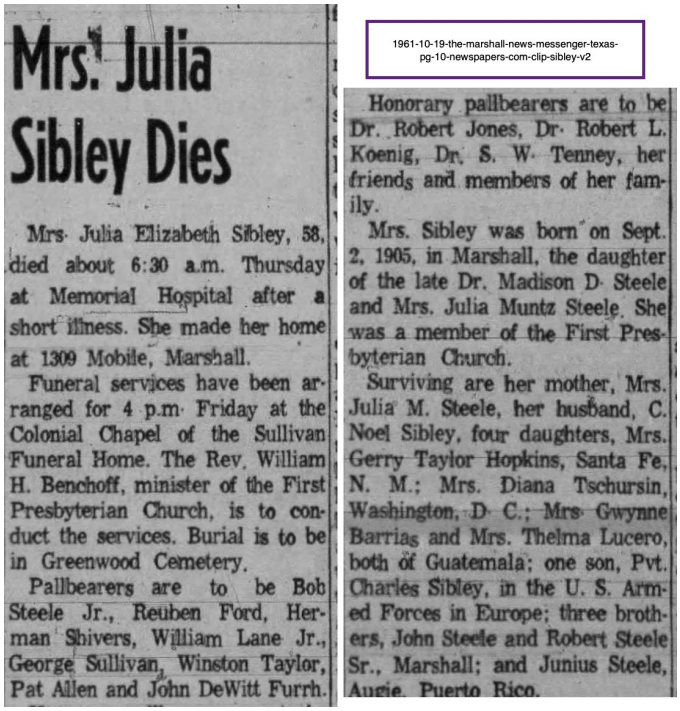
1961 (Oct 19) - Passing of wife Mrs. Julia Elizabeth Sibley

source, unmodified image - [HN00T7][GDrive]



Mrs. Julia Sibley Dies

Mrs. Julia Elizabeth Sibley, 58, died about 6:30 a.m. Thursday at Memorial Hospital after a short illness. She made her home at 1309 Mobile, Marshall.

Funeral services have been arranged for 4 p.m. Friday at the Colonial Chapel of the Sullivan Funeral Home. The Rev. William H. Benchoff, minister of the First Presbyterian Church, is to conduct the services. Burial is to be in Greenwood Cemetery.

Pallbearers are to be Bob Steele Jr., Reuben Ford, Herman Shivers, William Lane Jr., George Sullivan, Winston Taylor, Pat Allen and John DeWitt Furrh.

1961-10-19-the-marshall-news-messenger-texas-pg-10-newspapers-com-clip-sibley-v2

Honorary pallbearers are to be Dr. Robert Jones, Dr. Robert L. Koenig, Dr. S. W. Tenney, her friends and members of her family.

Mrs. Sibley was born on Sept. 2, 1905, in Marshall, the daughter of the late Dr. Madison D. Steele and Mrs. Julia Muntz Steele. She was a member of the First Presbyterian Church.

Surviving are her mother, Mrs. Julia M. Steele, her husband, C. Noel Sibley, four daughters, Mrs. Gerry Taylor Hopkins, Santa Fe, N. M.; Mrs. Diana Tschursin, Washington, D. C.; Mrs. Gwynne Barrias and Mrs. Thelma Lucero, both of Guatemala; one son, Pvt. Charles Sibley, in the U. S. Armed Forces in Europe; three brothers, John Steele and Robert Steele Sr., Marshall; and Junius Steele, Aguie, Puerto Rico.

Charles Sibley Dies Abroad

Relatives in Marshall have been advised of the death of Charles Noel Sibley, a former Marshall resident, in Guatemala City, Guatamala. He was the husband of the late Mrs. Elizabeth Steele Sibley, and they lived at 1309 Mobile in Marshall, until Mrs. Sibley's death in October 1961.

He is survived by two daughters, Mrs. Ricardo Barillas and Mrs. Javier Lucero, both of Guatemala; two step-daughters, Mrs. Gerry Taylor Hopkins, Santa Fe, N.M.; and Mrs. Diana Taylor McArthur, Washington, D.C.; two sons, Charles Sibley, in the armed forces in Germany, and Ray Sibley, San Diego, Calif.; three sisters, Miss Violet Sibley, Philadelphia, Pa.; Miss Doris Sibley and Miss Inez Sibley, Kingston, Jamaica; and one brother, Oswald Sibley, Montego Bay, Jamaica.

Mr. Sibley was a retired officer of the United Fruit Co.

Death certificate below -

Research comment - "The relationship seems to be downplayed, but Diana Lee Taylor MacArthur's mother was eventually found, and it opens up a whole array of network relationships. She was born Julia Elizabeth Steele in Marshall, Texas. The elusive husband turns out to be Charles Noel Sibley of Jamaica."

Charles Eugene Sibley

Submitted by Mary Alice Holt on Wed, 06/22/2011 - 1:40pm Army veteran Elizabethtown KY Honduras Obituaries

Charles Eugene Sibley, 76, of Elizabethtown, died Tuesday June 21, 2011, at the home of his daughter-in-law.

He was a native of Port Castilla, Honduras, and served in the United States Army.

He is preceded in death by his parents, Charles N. and Beatrice Sibley; and a son, Joseph Sibley.

He is survived by his daughter, Caroline Sibley; a stepdaughter, Alice; two stepsons, Ed and Bill; a sister, Thelma Lucero of Guatemala City, Guatemala; seven grandchildren and four great-grandchildren.

A memorial service was held Thursday, June 23, at Brown Funeral Home in Elizabethtown.

Charles Sibley

Charles Gald Sibley (August 7, 1917 – April 12, 1998) was an American ornithologist and molecular biologist. He had an immense influence on the scientific classification of birds, and the work that Sibley initiated has substantially altered our understanding of the evolutionary history of modern birds.

Sibley's taxonomy has been a major influence on the sequences adopted by ornithological organizations, especially the American Ornithologists' Union.

Charles Sibley is of no known family relation to renowned bird artist David Sibley.

Life and work

Educated in California (A.B. 1940; Ph.D. 1948 in Zoology, University of California, Berkeley. Minor fields: Paleontology, Botany), he did his first fieldwork in Mexico in 1939 and 1941, then in Solomon Islands, Bismarck Archipelago, New Guinea, and the Philippines during World War II while on leave from the U.S. Navy, in which he was Ensign to Lieutenant in the Communications and Medical Service Corps. He was based for much of the war at Emirau Island, in what is now New Ireland Province of Papua New Guinea. His first job after college was from 1948 to 1949 as instructor in Zoology and Curator of Birds, University of Kansas, followed from 1949 to 1953 as Assistant Professor of Zoology, San Jose State College, California. From 1953 to 1965 he was Associate Professor then Professor of Zoology and director of the ornithological laboratory at Cornell. Between 1965 and 1986 he was Professor of Biology and William Robertson Coe Prof. of Ornithology, Dept of Biology; and Curator of Birds at the Peabody Museum at Yale. From 1986 to 1992 he was Dean's Professor of Science and Professor of Biology at San Francisco State University, and from 1993 until his death he was Adjunct Professor of Biology at Sonoma State University.

Sibley developed an interest in hybridisation and its implications for evolution and taxonomy and, in the early 1960s he began to focus on molecular studies: of blood proteins, and then the electrophoresis of egg-white proteins.

By the early 1970s Sibley was pioneering DNA-DNA hybridisation studies, with the aim of discovering, once and for all, the true relationships between the modern orders of birds. These were highly controversial to begin with, and regarded by colleagues as anything from snake-oil salesmanship on the one hand to Holy Writ on the other.[1] With the passage of time and ever-improving laboratory methods, the balance of scientific opinion has shifted closer to the latter interpretation, though the picture is by no means clear-cut and simple. Some of Sibley's results – such as the close relationship of galliform birds and waterfowl and their distinctness from other neognaths – have been verified. Other results such as the inclusion of diverse groups into the Ciconiiformes have turned out to be very much in error.

Sibley became estranged from his American co-workers for a time and corresponded with overseas colleagues extensively. But by the mid to late 1980s, Sibley's ongoing work had reversed the trend. His revised phylogeny of living birds in the light of DNA analysis, published in various forms in 1986–1993 was both controversial and highly influential.

In 1986 he was elected a Member, National Academy of Sciences, U.S.A. In 1988 Sibley and Jon Ahlquist were awarded the Daniel Giraud Elliot Medal from the National Academy of Sciences.[2] He was elected President of the International Ornithological Congress in 1990. His landmark publications, *Phylogeny and Classification of Birds* (written with Ahlquist) and *Distribution and Taxonomy of Birds of the World* (with Burt Monroe) are among the most-cited of all ornithological works, the former setting out the influential Sibley-Ahlquist taxonomy.

Acid tongue

During the 1970s, Sibley was a highly controversial figure in ornithological circles, for both professional and personal reasons. His friend Richard Schodde, writing Sibley's obituary in *Emu*, commented that he was:

... a rebel with a cause. In argument he would bulldoze through, brooking no contradiction. Critics were baited with an acid tongue, and, in fits of temper, he could be a cruel mimic. In short, lesser mortals were not tolerated easily and, as has been said by others, collegiate friends were few. ... I never found him malicious or vindictive, even against those who had tried to bring him down. Nor was he particularly sophisticated or cultured, just a big, up-front Yank possessed by 'the big picture' in avian phylogeny and convinced of the righteousness of his cause and invincibility of his intellect.[3]

Partly due to personality conflicts, Sibley had few long-term collaborations with other scientists, with the notable exception of Jon Ahlquist. Nonetheless, he was effective in persuading others to provide him with the blood, tissue, and egg white samples which were the key to his work.[1]

Other ornithological Sibleys

Charles Gald Sibley is of no known family relation to renowned bird artist David Sibley, although the families knew each other: one of Charles' daughters babysat David, and David's father Fred worked for Charles at Yale.

There is some family resemblance, and Charles did a fair amount of genealogical research but could only establish that any relationship was no closer than fourth cousin.

Here is where we take note of how Wikipedia sets a narrative of things they don't want you to know. It states there is no known connection to bird artist David Sibley. So we go searching for David Sibley.

By Lynn Cline
The New Mexican

David Allen Sibley began observing birds when he was just knee-high to a young stork.

He had no idea his book, *The Sibley Guide to Birds*, published late in 2000 by Alfred A. Knopf, would take off in such graceful flight, just like a California condor.

The comprehensive field guidebook on North American birds, written and illustrated by Sibley and published under the auspices of the National Audubon Society, already has drawn praise as wide as the sky.

Journalists writing for the heavies — *The Wall Street Journal*, *The New York Times Book Review*, *Time Magazine* and *The New Yorker* — have commended Sibley's magnum opus and even drawn comparisons to ornithologists John James Audubon (1785-1851) and Roger Tory Peterson (1908-1996).

"I laugh every time I read (that) because it's something my publicist came up with," Sibley said in a soft-spoken voice, referring to the comparisons during a phone interview from his home in Concord, Mass. "Lots of people came up with it, but my publicist came up with it independently."

Sibley's guide is deserving of the praise. With more than 6,600 illustrations of 810 species and 330 regional populations, the book is a small encyclopedia.

Sibley's illustrations depict nearly every species in flight. He also includes voice descriptions as well as measurements indicating length, wingspan and weight. Best of all, he includes information for bird-watchers at all levels.

"In all situations, you must first consider the welfare of the birds," Sibley writes in the book's introduction. "Avoid making a disturbance, especially at roosting and nesting sites. Tread lightly and encourage others to do the same. Be respectful and helpful to others, especially to nonbirders (who may not appreciate someone trampling lawns or blocking traffic just to see a bird)."

That's good advice, especially in Santa Fe where birds live wing-to-neck with flocks of tourists and residents.

Sibley travels to New Mexico for two birding book events on Thursday, April 26. The first, a booksigning, takes place from 2 to 3 p.m. Thursday, April 26, at Collected Works Bookstore in Santa Fe. The second event, a talk and signing, takes place at 7 p.m. at Bound to be Read bookstore in Albuquerque.

Sibley's guidebook arrives at a time when bird watching is rumored to be the second most popular recreational sport in the country — behind golf or gardening, depending on whom you ask. According to *The Wall Street Journal*, birding attracts 42 million people in America.

In New Mexico, where lots of bird-watchers flock, approximately 450 species of birds exist. The least commonly seen birds in Northern New Mexico include the Swainson's Hawk, according to Lauren Parmeler, director of education at Randall Davey Audubon Center, which serves as the state office of the National Audubon Society. "Swainson's Hawk is a big migratory bird that migrates all the way to Argentina," Parmeler said. That's a bird most people don't see in Santa Fe. You have to go out and look for it."

Swainson's Hawk, according to Sibley, is a buteo, a species marked by flight characteristics and extensive variation in plumage and shape. Swainson's Hawk, the most slender of buteos, has a relatively long tail, long and fairly pointed wings and emits a long, high-pitched scream.

Sibley, who has spent 25 years amassing his field guide, basically grew up with birds. He is the son of professional ornithologist David Sibley, who was well-connected in the field. In fact, David Sibley spent his career competing with another bird expert named Charles Sibley.

"Charles Sibley was well-known," Sibley said. "He did research that got a lot of publicity, so a lot of people had heard the name Sibley associated with ornithology."

Sibley said his father and Charles Sibley even ended up working in the same department at Yale University, which caused some confusion in the public as to which Sibley had achieved which advances in the birding field.

Illustrations of a Sabine's gull, top, and a great blue heron, left, from "The Sibley Guide to Birds," above

Even though Sibley, who was born in 1961 in Plattsburgh, N.Y., has spent most of his life roaming the country, watching and drawing birds, he hasn't kept his head in the clouds. He knew at an early age that he wanted to devote his life to the fine-feathered friends.

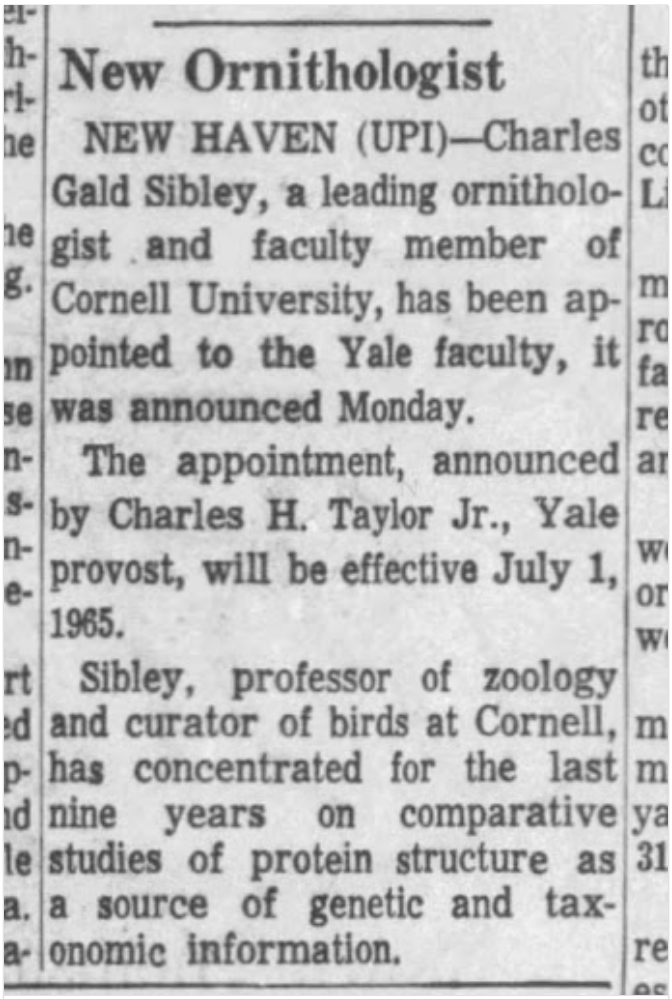
Clipping found in The Santa Fe New Mexican in Santa Fe, New Mexico on Apr 20, 2001. Charles/Fred/David Sibley

So this got us to thinking about the most famous bioweapons guy, Dr. Sidney Gottlieb. Born August 3, 1918 and died in the same year 1998. That is too close. Is Gottlieb a made up spook name? Are they all the same person?



New Ornithologist

NEW HAVEN (UPI)—Charles Gald Sibley, a leading ornithologist and faculty member of Cornell University, has been appointed to the Yale faculty, it was announced Monday.

The appointment, announced by Charles H. Taylor Jr., Yale provost, will be effective July 1, 1965.

Sibley, professor of zoology and curator of birds at Cornell, has concentrated for the last nine years on comparative studies of protein structure as a source of genetic and taxonomic information.

Clipping found in Hartford Courant in Hartford, Connecticut on May 18, 1965. Charles Gald Sibley

Seems interested in genetics. And there's the Taylor surname again. In fact, the Sibley's and Taylors have been marrying quite frequently for a couple of hundred years.

FRANCES L. SIBLEY

SANTA ROSA, CA — Frances L. Sibley died Sunday June 3, 2001 in Santa Rosa, CA. For 56 years, Frances was the beloved wife of the late Charles G. Sibley. She was the loving mother of Barbara of Cambridge, MA, Carol and her husband, Tom of Forest Grove, OR and Dorothy Wilson and her husband, Edward of Portland, OR and the devoted grandmother of Megan and Lin Wilson of Portland, OR. Her sister, Elizabeth Selix of Sonoma, CA, as well as 3 nieces and a nephew, all of California, also survive her.

Frances graduated from the University of California, Berkeley in the class of 1942, and was awarded an MS in home economics in 1945. She lived with her husband and family in Ithaca, New York from 1954-1965 and in Guilford, CT from 1965-1986. While in Guilford, Frances was active in the Leete's Island Garden Club and served as its president from 1982-84. In 1986 she and her husband retired to Tiburon, CA and in 1993 they moved to Santa Rosa. Frances was a weaver and member of the Handweavers' Guild of Connecticut and the Tamalpais Weavers' Guild.

Frances will be remembered as a kind and loving person, always facing the challenges of life with courage and good humor. Family and friends will celebrate her life at a future date. Arrangements are under the care of the Daniels Chapel of the Roses Funeral Home, (707)525-3730.■

Murray-Sidgmore

Miss Jamie Lynn Murray

Mr. and Mrs. Richard Murray of Spring Valley announce the engagement of their daughter, Miss Jamie Lynn Murray of Spring Valley, to John William Sidgmore of Spring Valley.

The bride-elect was graduated from Ramapo Senior High School in 1969, Rockland Community College in 1971 and SUNY at Oneonta in 1973 with a B.S. degree in elementary educational psychology. She is employed by East Ramapo Central Schools, Spring Valley.

Sidgmore is the son of Mr. and Mrs. John H. Sidgmore Jr. of Spring Valley. He was graduated from Ramapo Senior High School in 1969, Rockland Community College in 1971 and SUNY at Oneonta in 1973 with a B.A. degree in economics. He is employed by Rockwell International, Springfield, N.J.

The couple will be married in May in Spring Valley.

[HN01CY][GDrive]

Dec. 12, 2003 (Dec 12) - NYTimes - "John Sidgmore, 52, Dies; Headed WorldCom"

By Barnaby J. Feder / Source : [HN01CW][GDrive]

John W. Sidgmore, a leading Internet entrepreneur who became chairman and chief executive of the scandal-ridden WorldCom last year when its founder, Bernard J. Ebbers, was forced to resign, died yesterday of kidney failure, according to a statement issued by his family. He was 52 and lived in Potomac, Md.

Mr. Sidgmore became a senior executive at WorldCom in 1996 when it swallowed [**MFS Communications Company, Incorporated**] in a $14 billion deal. That takeover occurred shortly after Mr. Sidgmore arranged to merge [**UUNET Technologies, Incorporated**], the Internet networking company he ran, with MFS.

Initially, he and Mr. Ebbers worked closely together, although the compact, rock-'n'-roll-loving Mr. Sidgmore, who was a fixture in Washington, and the towering Mr. Ebbers, who operated out of Clinton, Miss., made a study in contrasts.

Mr. Sidgmore had built UUNet into the dominant carrier of Internet traffic. He helped WorldCom maintain a huge share of that traffic even as demand exploded and numerous other carriers spent billions of dollars to compete. He also played a central role in WorldCom's 1999 takeover of MCI, which made it the second-largest long-distance phone company after AT&T.

That same year, though, Mr. Sidgmore had a falling-out with Mr. Ebbers that began when Mr. Ebbers killed a deal Mr. Sidgmore had negotiated to acquire Nextel, a wireless phone company. He played little role in day-to-day operations for more than two years until Mr. Ebbers was forced to resign in April 2002.

Mr. Sidgmore spent much of his time advising or helping to manage start-up technology companies in the Washington area.

Mr. Sidgmore's plans to rescue WorldCom were sidetracked as evidence mounted that the company had been involved in one of the largest accounting frauds in history. By late July, less than three months after Mr. Sidgmore took over, his task became leading the company into the largest bankruptcy reorganization ever.

Mr. Sidgmore tenaciously fought critics who advocated that WorldCom be broken up in bankruptcy. He maintained his wry sense of humor, which had helped make him one of the industry's most well-liked executives. In a statement yesterday, WorldCom said that he had had a profound positive effect on its employees.

Mr. Sidgmore was never charged with any misconduct, but as the scope of WorldCom's crisis widened, so did pressure from investors and regulators for a more thorough break with the past. Michael D. Capellas, the executive who led Compaq into its merger with Hewlett-Packard, succeeded him a year ago.

"He created the backbone of the Internet," said Frank Dzubeck, president of Communications Network Architects, a consulting firm in Washington. "It was made up of islands until he put it together at UUNet to link the various service providers. It's unfortunate that he is going to be better remembered for the end of his career."

John William Sidgmore was born April 9, 1951, in Suffern, N.Y. Most of his early business career was spent with General Electric Information Systems, where he rose through the management ranks before leaving in 1989 to take on the challenge of rescuing Intellicom Solutions, a troubled computer services company. The company was sold to the Computer Sciences Corporation in 1991.

Mr. Sidgmore's rise to prominence began when he joined UUNet in 1994 and focused it on providing Internet service to businesses. A year later, he took it public in one of 1995's most successful stock sales.

Mr. Sidgmore is survived by his wife, Randi, and his son, Michael, both of Potomac; his father, John; a brother, Michael; and a sister, Jean.

2003 (Dec 11) - Former WorldCom CEO John Sidgmore dies at 52

https://www.bizjournals.com/washington/stories/2003/12/08/daily32.html

By Jeff Clabaugh – Staff Reporter

Dec 11, 2003, 4:33pm EST Updated Dec 11, 2003, 5:04pm EST

John Sidgmore, the WorldCom executive elevated to CEO when Bernie Ebbers was ousted last year, has died at age 52.

A statement says Sidgmore died from complications associated with kidney shutdown presumptively related to acute pancreatitis.

Sidgmore took over as CEO shortly before WorldCom first announced it had uncovered accounting irregularities and eventually filed for bankruptcy protection. He remained chief executive during the company's search for a permanent boss and stepped down last December when former Hewlett Packard president Michael Capellas was brought on board.

Sidgmore, previously chief executive of UUNet, led UUNet's $2 billion merger with MFS Communications and served as president of the combined companies. WorldCom later acquired MFS in a $15 billion deal, and named Sidgmore vice chairman and chief operations officer.

WorldCom issued a statement late Thursday praising Sidgemore as a leader. "He was a true Internet visionary, leader and friend who had an uncanny ability of bringing joy into people's lives. We celebrate John's entrepreneurial spirit that will remain with us going forward."

Sidgmore was widely considered an Internet pioneer and recognized as one of the most influential communications executives in the country. He is survived by his wife, Randi; son, Michael; and dog, Dewey.

The family says a funeral will be held Sunday morning, with details to be announced.

DEC. 14, 200312 : Los Angeles Times - "John Sidgmore, 52; Helped Reveal WorldCom Scandal"

[HN01GU][GDrive]

John Sidgmore, 52, the WorldCom executive who helped reveal the accounting troubles that led to the biggest bankruptcy filing in U.S. history, died Thursday of complications associated with acute pancreatitis, a family spokesman announced.

A resident of Potomac, Md., Sidgmore was named president of WorldCom in April 2002, when the firm's founder, Bernard Ebbers, was forced to resign. Sidgmore quickly disclosed the company's accounting problems. He resigned last December but continued to work with WorldCom as a consultant.

Sidgmore had been vice chairman of the board when the company was involved in an accounting shell game to make it appear more profitable, but he said in July 2002, soon after the bankruptcy declaration, "I haven't been involved in the direct operations of the company in several years."

Earlier that month, he had expressed optimism about the firm, yet also apologized for its "past transgressions" and vowed to cooperate as the government investigated.

"We want the bad guys exposed," Sidgmore said at a news conference. "We want the bad guys punished." The Securities and Exchange Commission had filed civil fraud charges a week earlier against WorldCom after the company disclosed that it had improperly accounted for nearly $4 billion in expenses, thus inflating its earnings. The news sent the company's stock plummeting below a dime.

Sidgmore was born in Suffern, N.Y. He earned a bachelor's degree in economics from the State University of New York in 1973 and spent most of his early business career with General Electric Information Systems.

Silicon Beach Communications Inc.

http://beach.silcom.com/www/about/index.shtml

Who We Are

Communications Without Compromise

Silicon Beach Communications is a full service communications provider integrating Internet, voice, and data solutions. As an Integrated Communications Provider, the Company has a broad range of programs for individuals, growing businesses and major corporations. Our portfolio of Internet, telecommunications, and advanced network services are marketed through value-added resellers (VARs), independent agents, and internal direct-sales professionals. Silicon Beach delivers and supports its services through its Business Solutions Group and Consumer Solutions Group, backed by a complete Technical Support Department and a 24-hour network operations center.

Silicon Beach was founded in early 1994 to fulfill the region's burgeoning need for quality Internet service, and rapidly grew to be the largest, and best regional Internet Service Provider exclusively focused on the Central Coast. **A merger with NetLojix Communications in 1996** allowed the company to diversify its product offering with voice and data connectivity services, and become a full-service Integrated Communications Provider. Silicon Beach now offers a complete suite of communications products and services for individuals and businesses.

https://www.newswire.com/news/zomongo-tv-corp-selects-internet-pioneer-frank-dziuba-to-oversee-the-2898991

ZOMONGO.TV CORP selects Internet pioneer Frank Dziuba to oversee the continued expansion and technological advancement of Zomongo's network and software platforms.

J. O. Ostrowski, President and CEO of the USA & Canadian based ZOMONGO entities, announced the appointment of international internet communications expert Frank Dziuba as Chief Technology Officer.

PRESS RELEASE MAR 31, 2016

March 31, 2016 (Press Release) - Frank Dziuba, a U.S. Internet software and services expert, will serve as Chief Technology Officer for Zomongo.TV, ensuring the company can meet and bolster its plans for global expansion.

Mr. Dziuba' s list of accomplishments makes him perfectly suited to advance Zomongo's suite of communication products including ad streaming, digital advertising and mobile application development.

As a pioneer and entrepreneur in the early days of the World Wide Web, Mr. Dziuba founded an Internet Service Provider, "Silicon Beach Communications", in Santa Barbara, California in 1994. His ISP grew to be the largest in the central coast and was later acquired by Netlojix communications. During that time he also developed the first Internet auction dedicated to selling art and numismatics.

Mr. Dziuba provided consulting to Genuity Networks, a subsidiary of Bechtel and now owned by Level 3 Communications, and was integral in their deployment of their national Internet infrastructure. He worked with Cisco and the United Nations to build and host the 'Netaid.org' (now Mercy Corps) donations website after the Netaid live video concert event of October 9, 1999. **Later, working with UltraDNS, (now owned by Neustar), he designed the first implementation of their secure 'Enterprise DNS' Solution for large, secure, enterprise level corporations targeting fortune 1000 companies.**

More recently, Mr. Dziuba built a completely automated web based system for a customer self-managed teleconference service. This service allowed customers to call a toll free number and have as many as 300 callers in one audio conference. Recording calls and downloading the recordings was also automated. The web interface allowed the customer to see reports, billing and management of their conference codes on bridges positioned around the U.S. using secured communications.

Jeffrey Taylor, Zomongo's Chief Operations Officer stated "Frank brings to us over 30 years of technological achievement and groundbreaking ideas related to Internet communications and program development. We are excited to have Frank on board and feel he augments our management team and will effectively direct our efforts to create products and services that help companies with their marketing endeavors."

Obituary | Simpson's giving spirit was "larger than life"

Jan 22, 2006

W. Hunter Simpson

By Tan Vinh

Seattle Times staff reporter

W. Hunter Simpson, one of Seattle's top philanthropists and a former executive who is credited with starting the four-day workweek in Western Washington, died Friday night at Swedish Medical Center.

The cause was heart failure, his family said Saturday. Mr. Simpson was 79.

For much of the 1980s and '90s, Mr. Simpson was often at the top of every Seattleite's list when a volunteer was needed for advisory boards, election campaigns or to donate money. The Mercer Island millionaire was the former president and chief executive officer of [Physio-Control Corporation], maker of heart defibrillators and other heart and blood-pressure monitoring equipment.

Mr. Simpson, who joined [**Physio-Control Corporation**] in 1966 after 17 years as an IBM sales-and-marketing executive, quickly turned the Redmond-based company into a powerhouse and cultivated a loyal following among his employees, whom he referred to as "team members."

His idea of the 10-hour-day, four-day workweek remains a common practice. In 1985, his company was included in the book, "The 100 Best Companies to Work for in America."

"He was larger than life," said William Gerberding, former president of the University of Washington, where Mr. Simpson served on the Board of Regents from 1981-93. "He had many roles — in politics, in philanthropy and at the university and in business."

Gerberding considered Mr. Simpson "one of the greatest regents in the history of the university" and said he was a key player in building UW campuses in Bothell and Tacoma.

During the 1980s, Mr. Simpson was instrumental in pushing the UW to turn to the private sector for fundraising, which helped the university raise tens of millions of dollars, UW officials said.

"He was the most generous and giving man. ... He had a lot of passion for many causes, particularly for the University of Washington," said his daughter, Christine Brent.

Mr. Simpson was born Nov. 2, 1926, in Tacoma and graduated from Stadium High School. After graduating from the UW with a business degree in 1949, he became a rising star at IBM, overseeing 600 workers in 11 states from his office in downtown Seattle.

In 1966, he took over Physio and quickly turned it into one of the nation's most respected companies. Eli Lilly bought the company for $149 million 14 years later, but kept him in charge.

When Mr. Simpson retired in 1985, the company had reached the $100 million mark in annual sales. The company was purchased by Medtronic in 1998.

Mr. Simpson was an early advocate of turning Seattle into a biotech hub and investing locally.

"I get a pitch in the mail once a month: 'Why don't you build your machines in Taiwan, why don't you build your machines in Korea.' I just throw that stuff away," Simpson told The Seattle Times in 1985. "My responsibility is to create opportunities right here."

He kept a busy schedule, serving on the Mercer Island City Council and 30 medical, educational and nonprofit boards.

At the UW, though, he made headlines in 1986 for launching a fundraising drive on behalf of then-Gov. Booth Gardner at the same time he was asking Gardner to reappoint him to the UW Board of Regents. He was eventually reappointed to the board.

He was involved in another debate in 1997, when he was a volunteer on the state Information Services Board. He was fined for his part in a unanimous vote to uphold a state computer contract with IBM while he owned stock in the company.

The ruling did not taint Mr. Simpson's reputation, but he considered it unfair and vowed at the time to retreat from civic life. Nonetheless, Mr. Simpson remained active in civic causes, family and friends said.

Mr. Simpson loved sailing and was an "auctionholic," said childhood friend Dr. George Thomas. He once outbid everyone for a flight in a Russian MiG jet fighter for his wife of 54 years, Dorothy Lewis.

In addition to his wife, Mr. Simpson is survived by his brother, Robert Simpson of Spokane; a son, Brooks Simpson, of Bellevue; daughters Christine Brent of Tiburon, Calif., and Anne Simpson of Mercer Island; and six grandchildren. Mr. Simpson lost his 18-year-old grandson, R. Hunter Simpson, to brain cancer on Dec. 31.

A memorial service will be held Saturday at Emmanuel Episcopal Church, 4400 86th Ave. S.E., Mercer Island, followed by a celebration of life at the Conibear Shellhouse at the UW. Times for both events were not yet available.

2006-01-20-legacy-com-w-hunter-simpson-79.pdf

W. Hunter SIMPSON November 2, 1926 - January 20, 2006 W. Hunter Simpson, 79, former President and CEO of [**Physio-Control Corporation**] and past University of Washington Regent, died Friday, January 20, 2006 of heart failure following a brief illness. He passed peacefully surrounded by his loving family at Swedish Hospital. Born on November 2, 1926 in Tacoma, Washington, to Stewart and Anne Simpson, he graduated from Stadium High School. After beginning college at the University of Washington, Hunter was assigned in 1945 to attend the University of California, Berkeley as part of the Marine V-12 Program. The following year, he returned to the University of Washington and graduated in 1949 with a B.A. in Business Administration. He was a member of the Phi Delta Theta fraternity. After graduation, Hunter worked for IBM's Data Processing Division in the Seattle office, but was called back into service as a Marine Corp Captain during the Korean War. He returned to IBM after his service. During the last five years of his 17-year tenure with IBM, he was the executive responsible for sales and marketing across the Pacific Northwest. From 1966 to 1986, Hunter was president and CEO of [**Physio-Control Corporation**], a manufacturer of medical electronic equipment which dramatically changed the face of emergency medical care with the introduction of the first portable, battery-powered LIFEPAK defibrillator/monitor. The device revolutionized emergency response, enabling specialty trained paramedics to defibrillate patients in the field prior to transport to a hospital, saving lives around the world. From a near-bankrupt operation of three people, Hunter led [**Physio-Control Corporation**] to the position of world leader in the industry. He established enlighted and novel management practices, unheard of in the '60s and '70s. Hunter married Dorothy Lewis of Miami Beach, Florida in 1951. Hunter and Dottie have been active and energetic participants in the Seattle community for five decades. Together they were awarded, in 2002, the inaugural Gates Volunteer Service Award in recognition of their inspiring leadership and philanthropy on behalf of the University of Washington. Hunter served as a University of Washington Regent from 1981 to 1993, and was a founding director of the Washington Research Foundation, with the purpose of managing and licensing technologies from the UW for the benefit of scientific research. The University of Washington was one of Hunter's primary passions, and he played a major role as a Regent and philanthropist in its continuing development as a leading research university. His standards and vision for the University were ambitious, and his energy and dedication were extraordinary. Hunter also served on numerous boards of Northwest-based corporations and non-profits, including Immunex Corp., Data I/O Corp., Edmark Corp., ACT Theatre, KCTS public TV, Overlake and Children's Hospital Foundations, and the Columbia Tower Club where he was the Founding Chairman. Additionally, Hunter enthusiastically contributed to important Mercer Island issues, including the multi-year effort to ensure I-90 had a positive impact on the island, as well as actively serving a full term on the Mercer Island City Council. Always humble with recognition, he was the recipient of many honors and awards over the years for his contributions to business and the community. He was inducted into the Junior Achievement Business Hall of Fame as a Laureate in 1994. Hunter was a devoted husband and father, always enthusiastically supporting his wife and children in their many professional and philanthropic endeavors. He was the family cheerleader who directed Christmas and summer gatherings with the skill of a CEO and the humor of a stand-up comedian. "Let's have one meeting," quickly got the attention of his clan of children and grandchildren. Hunter's great love of the Northwest was well known. He always referred to it as "God's country." The hard work of corporate life was balanced with time spent enjoying his outdoor playground. He often reminded friends and family of Seattle's unique environment where you could sail in the morning and ski in the afternoon - and get the half-day ticket price! Skiing gave way over the years to more time on the water with summers spent cruising the San Juans and Desolation Sound in various family sailboats named Nirvana and finally on the "lovely lady" Circe. Hunter is survived by Dorothy (Dottie) Lewis Simpson, wife of 54 years; their children, Brooks Simpson, Anne Simpson and Christine Simpson Brent; son-in-law, Dr. Bruce Brent; grandchildren, Hailey and Blake Simpson, Eric and Kirsten Hagfors, and Leisa and Wyatt Brent; and brother, Robert Simpson of Spokane. He is preceded in death by his grandson, R. Hunter Simpson, who died December 31, 2005 of brain cancer. A Service for family and close friends will be held on Mercer Island at Emmanuel Episcopal Church on Saturday, January 28th at 1:00 p.m. A Celebration of Life will follow, for all friends and acquaintances, at the University of Washington's Conibear Shellhouse. It will begin promptly at 4:30 p.m. with a program of remembrance. In lieu of flowers, memorials may be sent to the Medic One Foundation, the R. Hunter Simpson Foundation at the Seattle Foundation, or the University of Washington.

Singer Corporation

Wikipedia Singer Corporation

Wikipedia capture : [HK0004][GDrive]

Singer Corporation is an American manufacturer of domestic sewing machines, first established as **I. M. Singer & Co.** in 1851 by Isaac Merritt Singer [HK0006] with New York lawyer Edward Clark. Best known for its sewing machines, it was renamed **Singer Manufacturing Company** in 1865, then **the Singer Company** in 1963. It is based in La Vergne, Tennessee, near Nashville. Its first large factory for mass production was built in Elizabeth, New Jersey, in 1863.

History of Singer's sewing machines and its business

Old Singer logo

A Singer 1851 sewing machine

Singer Corporation's original design was the first practical sewing machine for general domestic use. It incorporated the basic eye-pointed needle and lock stitch developed by Elias Howe, who won a patent-infringement suit against Singer in 1854.

Patent No. 8294, of August 12, 1851, introduced one of the most useful machines, and one of the most remarkable men, that have figured in the development of the sewing machine. Isaac Merritt Singer, strolling player, theater manager, inventor, and millionaire, brought into the business a new machine and novel methods of exploitation, which gave a powerful impulse to the youthful industry. The Singer improvements met the demand of the tailoring, and leather industries for a heavier and more powerful machine.

Singer consolidated enough patents in the field to enable him to engage in mass production, and by 1860, his company was the largest manufacturer of sewing machines in the world. In 1885, Singer produced its first "vibrating shuttle" sewing machine, an improvement over contemporary transverse shuttle designs (see bobbin drivers). Singer began to market its machines internationally in 1855 and won first prize at the Paris World's Fair. The company demonstrated the first workable electric sewing machine at the Philadelphia electric exhibition in 1889 and began mass-producing domestic electric machines in 1910. Singer was also a marketing innovator and was a pioneer in promoting the use of installment payment plans.

Singer in Scotland

Workers leaving Singer Sewing Machine Factory on Clydebank

In 1867, the Singer Company decided that the demand for their sewing machines in the United Kingdom was sufficiently high to open a local factory in Glasgow on John Street. Singer Vice President George Ross McKenzie selected Glasgow because of its iron making industries, cheap labour, and shipping capabilities. Demand for sewing machines outstripped production at the new plant and by 1873, a new larger factory was completed on James Street, Bridgeton. By that point, Singer employed over 2,000 people in Scotland, but they still could not produce enough machines.

In 1882, McKenzie, by then President-elect of the Singer Manufacturing Company, undertook the ground breaking ceremony on 46 acres (19 ha) of farmland at Kilbowie, Clydebank. Originally, two main buildings were constructed, each 800-foot (240 m) long, 50-foot (15 m) wide and three storeys high. These were connected by three wings. Built above the middle wing was a 200-foot (61 m) tall clock tower with the "Singer" name clearly displayed for all to see for miles around. A total of 2.75 miles (4.43 km) of railway lines were laid throughout the factory to connect the different departments such as the boiler room, foundry, shipping and the lines to main railway stations. Sir Robert McAlpine was the building contractor and the factory was designed to be fire proof with water sprinklers, making it the most modern factory in Europe at that time.

With nearly a million square feet of space and almost 7,000 employees, it was possible to produce on average 13,000 machines a week, making it the largest sewing machine factory in the world. The Clydebank factory was so productive that in 1905, the U.S. Singer Company set up and registered the Singer Manufacturing Company Ltd. in the United Kingdom. Demand continued to exceed production, so each building was extended upwards to 6 storeys high. A railway station with the company name was established in 1907 with connections to adjoining towns and central Glasgow to assist in transporting the workforce to the facility.

In the First World War, sewing machine production gave way to munitions. The Singer Clydebank factory received over 5000 government contracts, and made 303 million artillery shells, shell components, fuses, and aeroplane parts, as well as grenades, rifle parts, and 361,000 horseshoes. Its labour force of 14,000 was about 70% female at war's end.

From its opening in 1884 until 1943, the Kilbowie factory produced approximately 36,000,000 sewing machines. Singer was the world leader and sold more

machines than all the other makers added together. In 1913, the factory shipped 1.3 million machines. The late 1950s and 1960s saw a period of significant change at the Clydebank factory. In 1958, Singer reduced production at their main American plant and transferred 40% of this production to the Clydebank factory in a bid to reduce costs. Between 1961 and 1964, the Clydebank factory underwent a £4 million modernization program which saw the Clydebank factory cease the production of cast iron machines and focus on the production of aluminium machines for western markets. As part of this modernisation programme, the famous Singer Clock was demolished in 1963. At the height of its productiveness in the mid 1960s, Singer employed over 16,000 workers but by the end of that decade, compulsory redundancies were taking place and 10 years later the workforce was down to 5,000. Financial problems and lack of orders forced the world's largest sewing machine factory to close in June 1980, bringing to an end over 100 years of sewing machine production in Scotland. The complex of buildings was demolished in 1998.

Painted Singer Sewing sign in Kingston, N.Y.

Marketing

The Singer sewing machine was the first complex standardized technology to be mass marketed. It was not the first sewing machine, and its patent in 1851 led to a patent battle with Elias Howe, inventor of the lockstitch machine. This eventually resulted in a patent sharing accord among the major firms. Marketing strategies included focusing on the manufacturing industry, gender identity, credit plans, and "hire purchases."

Singer's marketing emphasized the role of women and their relationship to the home, evoking ideals of virtue, modesty, and diligence. Though the sewing machine represented liberation from arduous hand sewing, it chiefly benefited those sewing for their families and themselves. Tradespeople relying on sewing as a livelihood still suffered from poor wages, which dropped further in response to the time savings gained by machine sewing. Singer offered credit purchases and rent-to-own arrangements, allowing people to rent a machine with the rental payments applied to the eventual purchase of the machine, and sold globally through the use of direct-sales door-to-door canvassers to demonstrate and sell the machines.

World War II

During World War II, the company suspended sewing machine production to take on government contracts for weapons manufacturing. Factories in the United States supplied the American forces with Norden bomb sights and M1 Carbine rifle receivers, while factories in Germany provided their armed forces with weapons.

In 1939, the company was given a production study by the government to draw plans and develop standard raw material sizes for building M1911A1 pistols. The following April 17, Singer was given an educational order of 500 units with serial numbers S800001 – S800500. The educational order was a program set up by the Ordnance Board in the U.S. to teach companies without gun-making experience to manufacture weapons.

After the 500 units were delivered to the U.S. government, the management decided to produce artillery and bomb sights. The pistol tooling and manufacturing machines were transferred to Remington Rand whilst some went to the Ithaca Gun Company. Approximately 1.75 million 1911A1 pistols were produced during World War II, making original Singer pistols relatively rare and collectable.

Post war and present

Singer resumed developing sewing machines in 1946. They introduced its first sewing machine with zigzag function in 1952, the Slant-o-Matic. 2011 marked their 160th anniversary. Currently, they manufacture computerized, heavy duty, embroidery, quilting, sergers, and mechanical sewing machines.

In 2017, they launched their new Singer Sewing Assistant App.

Diversification

In the 1960s the company diversified, acquiring the Friden calculator company in 1965 and General Precision Equipment Corporation in 1968. GPE included Librascope, The Kearfott Company, Inc, and Link Flight Simulation. In 1968 also Singer bought out GPS Systems and added it to the Link Simulations Systems Division (LSSD). This unit produced nuclear power plant control center simulators in Silver Spring, Maryland and Columbia, Maryland while flight simulators were produced in Binghamton, New York.

In 1987, corporate raider **Paul Alec Bilzerian** (born 1950) made a "greenmail" run at Singer, and ended up owning the company when no "White Knight" rescuer appeared. To recover his money, Bilzerian sold off parts of the company. Kearfott was split, the Kearfott Guidance & Navigation Corporation was sold to the Astronautics Corporation of America in 1988 and the Electronic Systems Division was purchased by GEC-Marconi in 1990, renamed GEC-Marconi Electronic Systems (and later incorporated into BAE Systems). The four Link divisions developing and supporting industrial and flight simulation were sold to Canadian Avionics Electronics (CAE) and became CAE-Link. The nuclear power simulator division became S3 Technologies, and later GSE Systems, and relocated to Eldersburg, MD. The Sewing Machine Division was sold in 1989 to Semi-Tech Microelectronics, a publicly traded Toronto-based company.

For several years in the 1970s, Singer set up a national sales force for CAT phototypesetting machines (of UNIX troff fame) made by another Massachusetts company, Graphic Systems Inc. This division was purchased by Wang Laboratories in 1978.

21st century

The Singer Corporation produces a range of consumer products, including electronic sewing machines. It is now part of SVP Worldwide, which also owns the Pfaff and Husqvarna Viking brands, which is in turn owned by Kohlberg & Company, which bought Singer in 2004.

Its main competitors are Baby Lock, Bernina, Brother, Janome, Juki and Aisin Seiki—a Toyota Group company.

Singer Buildings

Singer was heavily involved in Manhattan real estate in the 1800s through Edward Clark, a founder of the company. Clark had built The Dakota apartments and other Manhattan buildings in the 1880s. In 1900, the Singer company retained Ernest Flagg to build a 12-story loft building at Broadway and Prince Street in Lower Manhattan. The building is now considered architecturally notable, and has been restored.

The 47-story Singer Building, completed in 1908, was also designed by Flagg, who designed two landmark residences for Bourne. Constructed during Bourne's tenure, the Singer Building (demolished in 1968) was then the tallest building in the world and was the tallest building to be intentionally

demolished until the Twin Towers of the World Trade Center were destroyed in the September 11 attacks.

At their Clydebank factory Singer built a 200 feet (61 m) clock tower which stood over the central wing and had the reputation of being the largest four-faced clock in the world. Each face weighed five tons and it took four men fifteen minutes twice a week to keep it wound. The tower was demolished after the factory closed in 1980 and now site of Clydebank Business Park. Singer railway station, built to serve the factory, is still in operation.

The famous Singer House, designed by architect Pavel Suzor, was built in 1902–1904 at Nevsky Prospekt in Saint Petersburg for headquarters of the Russian branch of the company. This modern style building (situated just opposite to the Kazan Cathedral) is officially recognized as an object of Russian historical-cultural heritage.

In 2018, a large factory fire destroyed a Singer distribution office and warehouse in Seven Hills, Sydney. Singer had manufactured sewing machines in Australia at a purpose-built plant in the western Sydney suburb of Penrith, from 1959 until 1967.

List of company presidents

- Isaac Merritt Singer [HK0006] (1851–1863)
- Inslee Hopper (1863–1875)
- Edward C. Clark (1875–1882)
- George Ross McKenzie (1882–1889)
- Frederick Gilbert Bourne (1889–1905)
- Sir Douglas Alexander (1905–1949)
- Milton C. Lightner (1949–1958)
- Donald P. Kircher (1958–1975)
- **Joseph Bernard Flavin** (born 1928) (1975–1987)
- **Paul Alec Bilzerian** (born 1950) (1987–1989)
- Iftikhar Ahmed (1989–1997)
- Stephen H. Goodman (1998–2004)

History Article from "ReferenceForBusiness.com" : "The Singer Company N.V. - Company Profile, Information, Business Description, History, Background Information"

See [HW000A][GDrive]

The Singer Company N.V. is the number one maker and seller of consumer and industrial sewing machines in the world, not to mention the oldest. With distribution into more than 150 countries worldwide and ownership of 1,500 retail outlets, Singer boasts of having one of the best-known brand names in the world. Throughout the late 20th century, however, Singer has struggled to maintain profitability, and the original sewing operations have weathered several incarnations as a private and a public company.

Company Origins

Isaac Merritt Singer was born in Pittstown, New York, in 1811, and ran away from his immigrant parents at the age of 12 to join a troupe of traveling actors. Singer remained an actor until 1835. During the following years he worked at various jobs while he invented things on the side. By 1850, Singer had gone to Boston with a patented device for carving wood-block type he hoped to sell to type manufacturers.

In Boston, Singer became interested in a prospective client's sewing machine repair business. The first patent for a sewing machine had been granted in England in 1790, but because of their unreliability none of the machines since then had been commercially successful. The first sewing machine with an eye-pointed needle, invented in 1846 by Elias Howe, seemed on the verge of capturing the public interest, but it, too, required frequent repairs. Singer quickly set to work to invent a reliable machine.

Singer finished his machine in 1850 and was granted a patent for it in 1851, the same year he established I.M. Singer and Company. The machine was an immediate success, prompting Howe to file suit against Singer for patent infringement. In 1854 Singer hired a young lawyer named Edward Clark to defend him; Clark agreed to take the case in exchange for a third of Singer's business, and eventually the two men became equal partners in the company, Singer running the manufacturing side and Clark the financial and sales side.

Clark stymied the lawsuits brought against Singer and then brought the manufacturers together to pool their patents by creating the Singer Machine Combination, the first patent pool in the United States. The combination, which lasted until 1877, when the last patent ran out, licensed 24 sewing machine manufacturers to make the machines for $15 a machine, with Singer and Howe receiving $5 each for every machine sold domestically.

Expansion in the 19th Century

With Clark supervising the day-to-day operations, I.M. Singer and Company began to grow rapidly. Until the late 1850s the price of a sewing machine limited its market to commercial interests like professional tailors and harness manufacturers. But at that time, Clark introduced the first consumer installment payment plan. This plan, combined with an aggressive marketing strategy, enabled the young company to survive the business panic of 1857 and gave Singer the decisive lead in sewing machines for more than a century.

In 1863 Clark and Singer dissolved their partnership and the company was incorporated as Singer Manufacturing Company after Singer's rather sordid personal life (which eventually resulted in 24 children by four women) came to light. Both Clark and Singer retained some stock in the company but sold the rest to their employees. Clark continued as president of the company until his death in 1882; Isaac Singer, who had fled to Europe, died in England in 1875.

employees. Clark continued as president of the company until his death in 1882; Isaac Singer, who had fled to Europe, died in England in 1875.

For the next 70 years, the business was led by three men: F.G. Bourne, who was president from 1873 to 1905; Douglas Alexander, who led the company from 1906 to 1949; and Milton Lightner, who served from 1949 to 1958. These men increased Singer's role as the United States' first multinational company. Singer had begun manufacturing in Scotland in 1867 and in Canada in 1873. By the 1880s, the company's extensive European operations were exporting sewing machines to Africa and soon after the turn of the century Singer was selling its product in the South Pacific. The one setback during this growth and expansion occurred in 1917, when the company's Russian holdings were seized during the Bolshevik Revolution. In 1918 Singer acquired the Diehl Manufacturing Company to make sewing machine motors.

Throughout the 1920s and 1930s, Singer's profits rose steadily as it convinced more and more people around the world that a Singer sewing machine was indispensable. By the end of World War II, however, the sewing machine market had matured in the United States. To make matters worse, within a few years European manufacturers were offering zig-zag machines (which Singer had decided in the 1930s would not find a market in the United States) and, suddenly, highly competitive Japanese manufacturers began to flood the market. In the United States alone, Singer's market share had halved, to only one-third, by the late 1950s.

Singer had hired a lawyer, Donald P. Kircher, to supervise the company's legal affairs in 1948. In 1955 Kircher was appointed Lightner's assistant, and in 1958 he was made president. Hired to help turn Singer around, Kircher began a complete reorganization of the company: plants were modernized, manufacturing procedures automated, products upgraded, and merchandising improved. By 1963 Singer's share in the U.S. sewing machine market had increased to 40 percent.

Diversification in the 1950s and 1960s

Under Kircher's direction, Singer also began an ambitious overseas construction program. Besides spending large amounts of money to revamp company facilities in Scotland, Brazil, France, West Germany, and Italy, Kircher also started building new factories in Australia, Mexico, and the Philippines. In addition, Kircher reaffirmed the strategy of looking toward underdeveloped regions of the world for the company's largest markets.

Kircher also began a domestic diversification program. One of his first decisions was to purchase Haller, Raymond & Brown, Inc., a leading electronics research firm and Singer's first step into the electronics industry. He also bought three companies in 1960 and 1961: two knitting-machine makers and a carpet-tufting-machinery maker. Initially, this diversification strategy was also successful. Between 1958 and 1963, Singer's sales almost doubled, to $1.2 billion (between 1952 and 1956 sales had risen only 12 percent, from $325 million to $364 million). In 1963 Singer dropped the "Manufacturing" from its name to better reflect the nature of its business.

Kircher's plan also included a more aggressive acquisition and diversification policy. The first important purchase, in 1963, was of Friden, Inc., a manufacturer of office equipment and calculators. The second one, of General Precision Equipment Corporation (GPE), was made in 1968. General Precision gave Singer access to three markets: industrial products (such as gas meters), defense electronics, and aerospace. But GPE and Friden were only part of Kircher's grand plan. Altogether, Kircher bought 22 manufacturing firms with products ranging from audio to aerospace equipment.

In 1958, 90 percent of Singer's total sales came from sewing machines; by 1970, this portion was reduced to 35 percent, and Kircher's diversification strategy seemed to work. Singer's sales exceeded $1.9 billion, 40 percent from business abroad.

Losses in the 1970s

But Kircher, described by subordinates as autocratic and imperious, had overreached himself. Although the company reported $2.6 billion in sales for 1974, one Wall Street analyst estimated that Singer's debt had reached $1.1 billion--a staggering price for its acquisition program. Combined with a collapse in the aerospace market and a glut in office equipment in the late 1960s, it is not surprising that Singer reported a $10.1 million loss in 1974. The single bright spot that year was Singer's original sewing machine operation, which accounted for 54 percent of company sales.

While Kircher was confined to a hospital bed in 1975, the board of directors looked for someone to replace him. They hired **Joseph Bernard Flavin** (born 1928) *, who had worked at IBM and at Xerox, where he was an executive vice-president. Forty-seven years old when he became Singer's president, Flavin immediately took a $411 million write-off to eliminate the company's money-losing ventures, including a home-building concern, a printing operation, a telecommunications firm, an Italian household appliance plant, and a West German mail-order house. This write-off was the largest of its time and reduced Singer's book value by 50 percent. Flavin then planned to revitalize the company's sewing machine operation and develop its power tool and aerospace businesses.*

Over the next few years, Singer also concentrated on developing high-technology electric components, including air conditioning and heating systems, gas meters, thermostats, electrical switches, dishwashers, and auto dashboards. The company made the guidance system for the Trident missile and navigation equipment for airplanes and ships, and Singer electrical instruments played an important role in NASA's Apollo lunar modules.

Flavin managed to reduce the company's $1.1 billion debt by 55 percent after he became president, but in 1979 he took a $130 million write-off on the sewing machine business, which in North America and Europe had fallen off drastically. This move involved the restructuring of Singer's North American and European operations; its oldest factory in Europe, near Clydebank, Scotland, was one of the casualties. Flavin also replaced 80 of his top 200 managers. All these changes were made in the middle of a headquarters move from New York City to Stamford, Connecticut.

In 1980 Singer's aerospace and marine divisions' operating profits increased by 34 percent, to $36 million, due in large part to Singer's role as the nation's leading manufacturer of aircraft simulators, including the one used to train space shuttle astronauts. In addition, this division won a large contract for helicopters from the Defense Department in 1981. Encouraged by these results, management decided to create SimuFlite, a new venture that provided ground school and flight simulation training for corporate pilots.

Continued Problems in the 1980s

Foreign manufacturers like Bernina, Pfaff, and Viking, along with inexpensive imports from Japan, began to cut deeply into what little was left of Singer's sewing machine market during the early 1980s. That and the belief among top officials at Singer that the sewing industry in the United States was finally drying up led the company to abandon its century-old core business. In 1986 Singer spun off its sewing machine division as a separate company called SSMC Inc. Singer also got rid of all 1,600 company-owned stores and service centers, either by closing them or making them independent.

Although Singer had become a $2 billion-a-year defense conglomerate, it was beset by endless problems and an enormous debt. Its stock price was driven down by the announcement of a $20 million loss in July 1987, which it attributed to development costs for several new aerospace products. Then, that fall, Chairman Joseph Flavin died unexpectedly. Therefore, to no one's surprise, Singer became a prime takeover candidate. The buyer was a surprise, however: **Paul Alec Bilzerian** (born 1950) *, a somewhat obscure corporate raider best known as a greenmailer. For $50 a share--some $15 below what Singer's investment banker, Goldman Sachs, had expected it to sell for--Bilzerian walked away with Singer.*

Bilzerian took on a huge debt load. Bilzerian first [illegible] of Singer's assets, then the assets [illegible] all of Singer's defense businesses. But

Despite a staggering debt load, Bilzerian at first promised not to strip Singer of its most productive assets, planning only to sell off its defense electronics business. But only months later, prime assets began to go. Between July and October 1988 Bilzerian sold eight of Singer's 12 divisions, for about $2 billion, which tidily covered his debt.

But, in December 1988, Bilzerian was indicted--for non-Singer-related activities--and in May 1989 he was convicted of nine counts of securities and tax violations. More troublesome for the company itself, however, was the multitude of suits filed against it after mid-1988 by former employees regarding pension benefits; stockholders disillusioned by Bilzerian's dealings; buyers of divisions who claimed they were overcharged; and the federal government, which sought treble damages of $231 million for Defense Department overcharges dating back to 1980. Renamed the Bicoastal Corporation in 1989, the company agreed to pay $55 million to the federal government in 1992 to settle the fraud charges.

Rebounding: Early 1990s

Meanwhile, SSMC, the original sewing machine business, defied predictions and managed to stay in business. In 1989 Semi-Tech Global purchased SSMC and began to turn the company around. SSMC reclaimed its heritage by renaming itself The Singer Company. Then, in 1991, the company offered shares to the public on the New York Stock Exchange. Semi-Tech Global retained control of the company with ownership of 50 percent of the shares. Two years later, Semi-Tech Global sold its interest in Singer to Semi-Tech Corp., owner of 43 percent of Semi-Tech Global.

Also in 1993, Semi-Tech Global acquired G.M. Pfaff AG, the second largest sewing machine manufacturer in the world. Founded in 1862 in Germany, the company had a history almost as long as Singer's and had built a comparable international reputation. Although Pfaff sold its machines mostly through its own retail stores in Germany, its international sales were handled through mass merchants, independent dealers, and distributors.

In the early 1990s Pfaff was operating at a loss, and Semi-Tech Global purchased 72 percent of the company's shares, thus gaining control of the company. Semi-Tech cut staff, outsourced and relocated much of the company's manufacturing, and sought growth primarily in developing countries. In addition, Semi-Tech Global hired Singer to manage the company. Within the next few years, Singer and Pfaff were cross-sourcing each other's products and had created efficiencies in research and development by working together to design new products.

In the mid-1990s Singer began selling other consumer durable products, hoping to cash in on widespread respect and awareness of its brand. New products included televisions, videocassette recorders, and home appliances. The company focused its sale of this new line in developing countries, where it had established distribution networks and, unlike most manufacturers and retailers in these countries, offered credit plans. For example, Singer met with a great deal of success in Mexico, where it focused its efforts on working-class consumers unused to the idea of credit but unable to buy a major appliance like a sewing machine without it. Singer's sales in Mexico quintupled between 1988 and 1993 and showed no signs of diminishing. It also held its repossession rate to about two percent.

Despite success in such developing countries as Mexico, Singer was reporting losses by the late 1990s. Although the company could still claim profits of $29 million in 1996, in 1997 Singer lost $238 million on revenues of $1.1 billion. Revenues had declined 19 percent from the previous year, stemming from the economic crisis in Asia, an economic slowdown in Brazil, and weak sales in the United States. A new president and chief executive officer, Stephen H. Goodman, took charge in early 1998.

In an effort to eliminate redundancies and thus reduce costs, Singer acquired Pfaff in 1997 for $157.5 million. Thus Singer's management of Pfaff became permanent when it purchased Semi-Tech Global's 80.5 percent interest in the company. Singer consolidated the two companies' marketing and distribution operations, shared their manufacturing plants, and reduced their combined overheads. As part of this reorganization, Singer eliminated almost 6,000 jobs, cutting 5,531 from manufacturing and 437 from marketing. The company projected this 28 percent cut would result in savings of $104 million a year.

Although revenues were up in 1998, to $1.26 billion, Singer still reported a loss of $207 million. The continued economic downturns in Asia and Brazil affected the company's performance, as did a decline in the industrial sewing market. Singer initiated a restructuring program in 1998 that included projected property sales of approximately $260 million. That year the company sold $37 million worth of property. In 1999 Singer continued with the program by selling its Taiwan operations for $58.6 million. On September 13, 1999, Singer announced that it was voluntarily filing for reorganization under Chapter 11 of the U.S. Bankruptcy Code. The company's stock continued to trade on the New York Stock Exchange at the NYSE's discretion.

CAE - Canadian Avaiation electronics

july 1988 - CAE buys link division

https://www.latimes.com/archives/la-xpm-1988-07-11-fi-4250-story.html

Singer Co. has sold its Link flight simulation and training systems division to CAE Industries of Canada for $550 million (U.S.). Singer has previously said that all of its divisions are up for sale following the takeover by stock speculator Paul A. Bilzerian in January. CAE, a manufacturer of commercial flight simulators and other industrial products, said it had reached a definitive agreement with Singer on the purchase. Singer's Link division, based in Binghamton, N.Y., employs 7,500 and posted revenue of $550 million in 1987.

- Nationality American
- Alma mater Cornell University, Albany Medical College
- Known for Texas cattle fever, Salmonella
- Scientific career : Fields : Epidemiology
- Institutions : US Department of Agriculture, Harvard University, Rockefeller University

Prof Theobald Smith FRS(For)[1] HFRSE (July 31, 1859 – December 10, 1934) was a pioneering epidemiologist, bacteriologist, pathologist and professor. He

is widely considered to be America's first internationally significant medical research scientist.[2][3] His work included the study of Texas cattle fever and the epidemiology of cattle infected by ticks transmitting protozoa. He also discovered a species of Salmonella, named for his chief Daniel E. Salmon, and studied anaphylaxis, then referred to as Theobald Smith phenomenon.[4] Smith taught at Columbian University (now George Washington University) and established the school's department of bacteriology, the first at a medical school in the United States.[4] He also worked at Harvard University and the Rockefeller Institute.

Education

Smith was born in Albany, New York, the son of Philip Smith and his wife, Theresa Kexel.[5]

He received a Bachelor of Philosophy degree from Cornell University in 1881, followed by an MD from Albany Medical College in 1883.[2] After his graduation from medical school, Smith held a variety of temporary positions which might broadly be considered under the modern heading of "medical laboratory technician". After some prodding by his former professors, Smith secured a new research lab assistant position with the Veterinary Division of the US Department of Agriculture (USDA) in Washington, D.C., beginning his position there in December 1883.[6]

Research

Smith became the Inspector of the newly created Bureau of Animal Industry (BAI) in 1884. Established by Congress to combat a wide range of animal diseases—from infectious disease of swine to bovine pneumonia, Texas cattle fever to glanders—Smith worked under Daniel E. Salmon, a veterinarian and Chief of the BAI.[7] Smith also discovered the bacterial species which would eventually form the genus Salmonella. After two years of work studying the efficacy of bacterial vaccination in pigs, Smith erroneously believed he had found the causative agent of hog cholera.[8]

Smith turned his attention to Texas fever, a debilitating cattle disease; this work is detailed in a chapter in Microbe Hunters, by Paul De Kruif. In 1889, he along with the veterinarian F.L. Kilbourne discovered Babesia bigemina, the tick-borne protozoan parasite responsible for Texas fever. This marked the first time that an arthropod had been definitively linked with the transmission of an infectious disease and presaged the eventual discovery of insects as important vectors in a number of diseases (see yellow fever, malaria).

Smith also taught at Columbian University in Washington, D.C. (now George Washington University) from 1886 to 1895, establishing the school's Department of Bacteriology. In 1887, Smith began research on water sanitation in his spare time, investigating the level of fecal coliform contamination in the Potomac River. Over the next five years, Smith expanded his studies to include the Hudson River and its tributaries.[9]

While Smith's work at the BAI had been highly productive, he chafed against the federal government bureaucracy and the lack of leadership from his supervisor. In 1895 Smith moved to Cambridge, Massachusetts to accept a dual appointment: serve as professor of comparative pathology at Harvard University, and direct the pathology lab at the Massachusetts State Board of Health.[6]

Smith joined the Rockefeller Institute for Medical Research as Director of the Department of Animal Pathology in 1915 and remained there until his retirement in 1929.

In 1933, Smith was awarded the Royal Society's prestigious Copley Medal "For his original research and observation on diseases of animals and man.".

Publications

- Parasitism and Disease (1934)

Other discoveries

- Observed differences between human and bovine tuberculosis (1895).
- Discussed the possibility of mosquitos as a malaria transmission vector (1899).
- Variation and bacterial pathogenesis (1900).
- Discovered anaphylaxis (1903), which is also sometimes referred to as "Theobald Smith's phenomenon".[10]
- Brucellosis infections
- Used toxin/antitoxin as a vaccine for diphtheria (1909).
- In the process of investigating an epidemic of infectious abortions of cattle in 1919, Smith described the bacteria responsible for fetal membrane disease in cows now known as Campylobacter fetus.[11]

[HW005Z][GDrive] Smith's acknowledged leadership in this field and his unmatched reputation for productive research led early in 1914 to an invitation from [**Dr. Simon Flexner (born 1863)**], director of the Rockefeller Institute for Medical Research, to head the newly endowed department of animal pathology to be established at Princeton, N.J. (In 1901, at the inception of the Institute, he had rejected an offer to become its director but had agreed to join the board of scientific directors under Welch's chairmanship.) Although fifty-five years old and not in robust health, Smith resigned from the State Board of Health that summer, but remained at Harvard for a year until preliminaries for the new department had been fulfilled. At a testimonial dinner in June 1915 extraordinary tributes were paid to Smith by distinguished colleagues from all over the world.

Encyclopedia.com (2021) - "Smith, Theobald"

Source : [HW005Z][GDrive]

[...] The scope and thoroughness of Smith's researches in bacteriology, immunology, and parasitology produced many discoveries of theoretical import and immediate utility to public health and veterinary medicine. **He was the most distinguished early American microbiologist and probably the leading comparative pathologist in the world.** His greatest accomplishment—elucidation of the causal agent and mode of transmission of Texas cattle fever—first conclusively proved that an infectious disease could be arthropod-borne. Unlike many contemporary bacteriologists in the United States, he received no training in France or Germany.

Smith's parents were Philipp Schmitt, a tailor and the son of a farmer, and Theresia Kexel, whose recent forebears were village schoolmasters. Both born in Nassau, Germany, they married in 1854 and emigrated to America, settling in Albany, N.Y., where Philipp followed his trade for more than forty years. They took in boarders, worked hard, and were very thrifty. Their second child and only son was baptized in his mother's Roman Catholic faith (the father being Lutheran) and given the surname of his godparent, Jacob Theobald, a friendly immigrant neighbor. He appears in the parish register as Theobald Schmitt but in high school lists as Theobald J. Smith, for he temporarily adopted his godfather's first name. **Before entering Cornell University**, he discarded the second

In high school lists as Theobald J. Smith, for he temporarily adopted his godfather's first name, **before entering Cornell University,** he dissarded the second initial and rejected the Roman church.

At home, German was spoken, and Smith's education began at a German-speaking private academy. As a youth he quoted Goethe, enjoyed Schiller, and subsequently mastered the original reports of Robert Koch and Paul Ehrlich. In 1872, after two years of parish schooling, he entered the recently founded Albany Free Academy, where he excelled in all subjects, became president of the debating society, and was valedictorian in 1876. With a state scholarship supplementing his earnings from piano lessons, organ-playing, and book keeping, **he entered Cornell in 1877,** His industry, versatility, and inclination for scientific studies brought durable friendships with the physiologist and comparative anatomist Burt G. Wilder and with the microscopist Simon H. Gage. In 1881 he received the Ph.B. degree with honors and enrolled at the Albany Medical College, where he headed the 1883 M.D. class. His thesis was entitled "Relations Between Cell-activity in Health and Disease."

Smith felt unready for private practice. **With Gage's help he obtained an assistantship with Daniel E. Salmon, chief of the veterinary division of the U.S. Department of Agriculture, commencing December 1883. Six months later he became inspector in the new Bureau of Animal Industry, established by Congress under Salmon's charge to combat bovine pleuropneumonia, glanders infectious diseases of swine, and Texas cattle fever. Smith taught himself Koch's culture-plate methods and improved on them. Through careful field and laboratory studies of swine epizootics, he differentiated hog cholera from the multiplex swine plague (Schweineseuche), implicating distinctive bacillary species for each disease.** These findings appeared in the annual reports of the Bureau from 1885 to 1895 and in two monographs, Hog Cholera: Its History, Nature and Treatment (1889) and Special Report on the Cause and Prevention of Swine Plague (1891). **In 1886 pioneer observations involving hog cholera bacilli were made by Smith on bacterial variation—a phenomenon that excited his continuing speculative interest—and on the immunity developed by pigeons inoculated with heat-killed cultures, thus heralding a new approach to bacterial vaccine production.** Salmon's assumption of sole or senior authorship of several reports on this bacillus led to the selection of the species in 1900 as the prototype of an eponymous Salmonel la genus. **Some twenty years after Smith discovered Salmonella choleraesuis, however, the actual etiological agent of hog cholera proved to be viral, and the bacillus was accepted thereafter as a secondary invader.**

These projects overlapped with another major assignment. Texas cattle fever, on which Smith worked intermittently, restricted by its summer incidence. In November 1892, more than six years after first observing "small round bodies" in red blood corpuscles from stricken cattle, he completed his classic monograph Investigations Into the Nature, Causation, and Prevention of Texas or Southern Cattle Fever (1893), He found that the disease resulted from erythrocyte destruction by a protozoan microparasite, Pyrosoma bigeminum, **carried in the blood of apparently healthy southern cattle and transmitted to susceptible northern cattle by the progeny of blood-sucking ticks (Boophilus bovis)**. The complex, **meticulously verified tick-borne mechanism was viewed incredulously by many, but never refuted**—a situation that facilitated acceptance within a decade of the mosquito-borne nature of malaria and yellow fever.

Smith's international recognition was hastened by his publications in German journals. In Washington he was promoted in 1891 to chief of the division of animal pathology of the Bureau of Animal Industry, but Salmon sought unduly to divert credit for Smith's work to himself and to other veterinarians. For example, F. L. Kilborne, superintendent of the experimental farm, was over generously made coauthor of the Texas fever monograph. Smith chafed under the repeated injustices but delayed resigning because of fresh research opportunities, including a novel protozoal disease of turkeys, and observations on two varieties of tubercle bacilli from mammals, which presaged a lifelong involvement with human and animal tuberculosis. Moreover, he had developed other interests, including the bacteriology of water supplies. Beginning in 1885 – 1886 with unofficial observations on the total bacterial count of samples from the Potomac River, he systematically examined (1892) microflora in the Hudson River for fecal bacteria. In a report to the New York Department of Health (1893), he advocated quantitative assays of Bacillus coli communis as an index of intestinal pollution and introduced the fermentation tube to demonstrate the presence of gas-producing coliforms. His techniques and detailed studies of B. coli and related microorganisms were incorporated in recommendations of the committee of American bacteriologists appointed in 1895 (on which Smith served under W. H. Welch's chairmanship) that culminated in the first edition of the Standard Methods of Water Analysis (1905) of the American Public Health Association.

Smith recognized that improved sanitation of sewage, milk, and water supplies required an aroused public interest. He disliked the limelight but nevertheless addressed farmers and sanitarians and regularly participated in meetings of the Biological Society of Washington. In 1886 he became lecturer and professor of bacteriology at the National Medical College (the medical department of Columbian University, now known as George Washington University). This appointment, one of the first chairs of bacteriology at an American medical school, was held until 1895. His industry was leavened and his dissatisfactions eased by a happy marriage in 1888 to Lilian Hillyer Egleston, a clergyman's daughter. Her intelligence, high principles, and social graces furthered her husband's work and life aims. They had two daughters (born in Washington) and a son.

In 1895 Smith resigned from the Bureau, becoming director of an antitoxin laboratory for the Massachusetts State Board of Health and professor of zoology at Harvard University. In six months, in improvised quarters at the Bussey Institution in Jamaica Plain, near Boston, he produced potent diphtheria antitoxin. Through a cooperative arrangement devised by H. P. Walcott, chairman of the State Board of Health, and President Charles Eliot of Harvard, both of whom admired Smith, he was appointed in 1896 to the new George F. Fabyan chair of comparative pathology, endowed by a wealthy Bostonian. Smith retained his directorship of the antitoxin laboratory and was privileged to reside in a mansion nearby, commuting daily to Harvard Medical School. Although he took teaching and committee duties seriously, his class lectures were more thorough than inspiring. The dual position intensified his resolute pursuit of new knowledge on the etiology, pathology, and prevention of communicable disease.

During a European trip in 1896, Smith met many leading microbiologists, including Ehrlich and Koch. To the latter he imparted preliminary observations on two varieties of mammalian tubercle bacilli, which he expanded in another classic report, "A Comparative Study of Bovine Tubercle Bacilli and of Human Bacilli From Sputum" (1898). Three years later Koch confirmed these distinctions but failed to acknowledge Smith's priority until 1908. Koch's extreme views on the negligible role of bovine bacilli in human tuberculosis were not endorsed by Smith.

In 1903 Smith inspected several European vaccine lymph manufacturing facilities, prior to designing an enlarged antitoxin and vaccine laboratory, erected in 1904. Smith was the first scientist in North America to adopt Ehrlich's standardized antitoxic unit; and he introduced many improvements in titration methods, which Ehrlich praised on visiting his laboratory in 1904. Irregularities in guinea pig susceptibility to toxin could be reduced through careful breeding and selection of animals (1905), especially by eliminating passively immune progeny of females previously used for titrations (1907). In studying the antigenic properties of toxin-antitoxin mixtures. Smith foresaw their application to the active immunization of humans (1909, 1910). Incidentally, he mentioned to Ehrlich his observation of the sudden death of guinea pigs following second injections of antitoxin. Ehrlich's colleague R. Otto verified this serum-hypersensitivity, designating it the "Theobald Smith phenomenon" (1906).

In 1903 Smith and A. L. Reagh reported agglutination relationships between certain members of the typhoid-paratyphoid-coliform group of bacilli. A second paper, again involving the hog-cholera bacillus, revealed the nonidentity of its flagellar and somatic agglutinogens. These immunologic contributions were fundamental to subsequent development of the Kauffmann-White schema for identifying Salmonella organisms serologically.

Research opportunities in parasitology were plentiful. Malaria was endemic in parts of Massachusetts, and as early as 1896 Smith conjectured that the disease was mosquito-borne. The reluctance of the State Board of Health to support his hypothesis, and difficulties in studying malaria in an unfavorable latitude, discouraged him from this field and the palm soon went to Ronald Ross. Other parasitic diseases studied by Smith were murine sarcosporidiosis (1901), coccidiosis of mouse kidney (1902) and rabbit intestine (1910), and amebiasis in the pig (1910). In 1913 he revived investigations into turkey blackhead begun twenty years earlier in Washington.

The output and functions of the pioneer state laboratory multiplied, and administrative duties mounted. Smith was consulted by bacteriologists, veterinarians, and sanitarians; and Eliot encouraged his defense of animal experimentation during an antivivisectionist campaign (1902), his membership on the Charles River Dam committee (1903), and his inquiry into possible damage to animals by smelter smoke from the Anaconda Copper Mining Company in Montana (1906). Before retiring from the presidency of Harvard University in 1909. Eliot persuaded Smith to give eight Lowell lectures (never published) to popularize comparative pathology. In 1912, as Harvard exchange professor at the University of Berlin, Smith took his family to Germany for six months. His inaugural address, "Parasitismus und Krankheit," abstractly developed the theme of his Harvey lecture (1906) on the parasitism of the tubercle bacillus. His convictions about the importance of comparative pathology were permeated increasingly by the concept of host-parasite interrelationships.

Smith's acknowledged leadership in this field and his unmatched reputation for productive research led early in 1914 to an invitation from [Dr. Simon Flexner (born 1863)], director of the Rockefeller Institute for Medical Research, to head the newly endowed department of animal pathology to be established at Princeton, N.J. (In 1901, at the inception of the Institute, he had rejected an offer to become its director but had agreed to join the board of scientific directors under Welch's chairmanship.) Although fifty-five years old and not in robust health, Smith resigned from the State Board of Health that summer, but remained at Harvard for a year until preliminaries for the new department had been fulfilled. At a testimonial dinner in June 1915 extraordinary tributes were paid to Smith by distinguished colleagues from all over the world.

For more than two years after this move, Smith was largely responsible, in consultation with Rockefeller Instituterepresentatives,for the general plans of the new division, design of laboratories and animal quarters, and selection of equipment. By the end of 1917 antipneumococcus and antimeningococcus sera were being manufactured in horses, researches into cattle diseases had begun, and a commodious director's house was under construction. In 1920 Smith and H .W. Graybill showed that the protozoon causing turkey blackhead was transmitted in novel fashion, involving ingestion by the healthy host of the embryonated eggs of a small nematode, Heterakis papillosa, which was parasitic in the ceca of infected birds. (The infective agent, erroneously designated Amoeba meleagridis by Smith many years before, was recognized by E. E. Tyzzer, his successor at Harvard, as a unique flagellate, which he renamed Histomonas meleagridis.) Proximity to a large dairy herd infected with Bang's disease reawakened Smith's early interest in Bacillus abortus and bovine contagious abortion; and he published, sometimes with R. B. Little, twelve papers and a monograph in this field. In 1926 they described the protection induced by vaccinating heifers with living B. abortus culture of low virulence. Other investigations concerned Vibrio fetus,a spirillar cause of cattle abortion, hitherto unrecognized in America; a possible new species, Bacillus actinoides, producing bronchopneumonia in calves;tne vitally protective antibodies in colostrum for newborn calves; and the pathogenicity of certain bovine strains of B, coli in calves deprived of colostrum.

In 1929, at age seventy, Smith relinquished his directorship of the division of animal pathology and was succeeded by Carl Ten Broeck, a longtime associate. He continued working at Princeton as member emeritus of the Rockefeller Institute. Smith had become vice-president of the board of scientific directors in 1924 and succeeded Welch as president in 1933. In November 1934 increasing weakness forced his hospitalization in New York, where he died just before an exploratory operation for intestinal cancer. His ashes and, six years later, those of his wife were buried in the woods at their summer home at Silver Lake, New Hampshire. In 1967 they were reinterred in the nearby Chocorua cemetery.

Honors came to Smith rather late in life. Between 1917 and 1933 he delivered the Herter, Mellon, Pasteur, Gross, De Lamar, Milbank Memorial, Welch, and Thayer lectures. A climactic series of five Vanuxem lectures, given at Princeton in 1933, and published in book form as Parasitism and Disease (1934), philosophically embodied his scientific credo. He received a dozen honorary doctorates from renowned American and European universities. He held membership in numerous scientific and medical societies, and was president of the Society of American Bacteriologists (1903), the National Tuberculosis Association (1926), and the Triennial Congress of Physicians and Surgeons (1928). He was elected a trustee of the Carnegie Institution in 1917. Smith was a foreign member of the Royal Society of London and eleven other ancient societies. Further honor awards were the Mary Kingsley, Flattery, Kober, Trudeau, Holland, Sedgwick, Manson, and Copley medals. Recommended several times for the Nobel prize, this ultimate distinction eluded him, although he surely deserved it. His portrait in oils is at the entrance to the Theobald Smith Building of the Rockefeller Institute, now known as the Rockefeller University, which he served so faithfully in various capacities for thirty-three years.

Smith unpretentiously summarized his own life work as "a study of the causes of infectious diseases and a search for their control." His outstanding success in this quest derived from a farsighted, dispassionately critical intelligence, linked to capacities for unsparing industry, punctilious concern for detail, technical inventiveness, and indomitable persistence. These qualities were applied to realistically chosen problems. Between 1883 and 1934 he published at least one scientific research report annually, and in several of these years the annual output was ten or more such publications–a record demanding rare degrees of self-discipline and dedication to the work ethic. As a director he was fair in judgment but sparing of praise, painstakingly conscientious, and abhorrent of waste or extravagance. All who knew Smith and his work respected him. Individuals as diverseas Osler, Welch, Simon Flexner, Prudden, Rous, [Dr. Richard Edwin Shope (born 1901)], and Ten Broeck held him in profound admiration. Smith was too reticent to be popular, and he displayed an element of restraint even with Gage, despite their half-century of close friendship. Hans Zinsser observes, "there was about him an unobtrusive pride, a reserve tinged with austerity which did not invite easy intimacy."

Smith's relaxations were modest and quiet, befitting his nature. When tired, he sought solace in reading, piano-playing, or calculus. During the hot summer months, he found refreshment at his lakeside home, where besides preparing manuscripts, he enjoyed boating, making household repairs, and landscaping. His pattern of life was consistently rational, yet he did not lack emotion. He hated war and wastefulness, for example, but knew that great ideas must be both launched and defended, often at high cost in a hostile environment. That a scientist of such unswerving probity and fine accomplishments should carry so little fame among his countrymen testifies partly to his self-effacing character. Many of his discriminating contemporaries thought him comparable to Pasteur and Koch, and the passage of time has not dimmed the luster of his contributions to the conquest of disease.

BIBLIOGRAPHY

I. Original Works. Mimeographed bibliographies were prepared by Earl B. McKinley and Ellen G. Acree, and also by the library of the Rockefeller Institute for Medical Research (now Rockefeller University), New York, Published versions accompany the sketch of Smith's life in Medical Classics, I (1936–1937), 347–371, and the biographical memoir by Hans Zinsser (see below), which respectively cite 224 and 247 items. These are all incomplete and contain inaccuracies. The actual total, excluding unverifiable editorials and multiple publications of the same article, is almost 300 titles.

His more important monographs include Hog Cholera; Its History, Nature and Treatment (Washington, 1889) written with D. E. Salmon and F. L. Kilborne; Special Report on the Cause and Prevention of Swine Plague (Washington, 1891); Investigations Into theNature, Causation, and Prevention of Texas or Southern Cattle Fever (Washington, 1893), written with F. L. Kilborne, repr. in Medical Classics. 1 (1936–1937), 372–597; Studies in Vaccinal Immunity Towards Disease of the Bovine Placenta Due to Bacillus Abortus (Infectious Abortion) (New York, 1923), written with R. B. Little: and Parasitism and Disease (Princeton, N.J., 1934), the Vanuxem lectures.

Smith's lasting interest in the bacteriology and immunology of tuberculosis is expressed in "The Diagnostic and Prognostic Value of the Bacillus Tuberculosis in the Sputum of Pulmonary Diseases," in Albany Medical Annals, 5 (1884), 193–198; "Some Practical Suggestions for the Suppression and Prevention of Bovine Tuberculosis," in Yearbook of the United States Department of Agriculture (1895), 317–330; "Two Varieties of the Tubercle Bacillus From Mammals," in Transactions of the Association of American Physicians. 11 (1896), 75–93; "A Comparative Study of Bovine Tubercle Bacilli and of Human Bacilli From Sputum," in Journal of Experimental Medicine, 3 (1898), 451–511, repr. in Medical Classics,1 (1936–1937), 599–669: "The Thermal Death-point of Tubercle Bacilli in Milk and Some Other Fluids," in Journal of Experimental Medicine,4 (1899) 217–233; "The Relation Between Bovine and Human Tuberculosis." in Medical News, 80 (1902), 343–346; "Studies in Mammalian Tubercle Bacilli. III . Description of a Bovine Bacillus From the Human Body. A Culture Test for Distinguishing the Human From the Bovine Type of Baccilli," in Transactions of the Association of American Physicians, 18 (1903), 109– 151; "The Parasitism of the Tubercle Bacillus and Its Bearing on Infection and Immunity," inJournal of the American Medical Association, 46 (1906), 1247–1254, 1345–1348, the Harvey lecture: "Certain Aspects of Natural and Acquired Resistance to Tuberculosis and Their Bearing on Preventive Measures," ibid.,68 (1917), 669–674, 764–769, the Mellon lecture; and "Focal Cell Reactions in Tuberculosis and Allied Diseases," in Bulletin of the Johns Hopkins Hospital, 53 (1933), 197–225, the Thayer lectures.

His main contributions to the bacteriology and immunology of diphtheria are "Antitoxic and Microbicide Powers of the Blood Serum After Immunization, With Special Reference to Diphtheria," in Albany Medical Annals, 16 (1895). 175– 189: "The Production of Diphtheria Antitoxin," in Journal of the Association of Engineering Societies, 16 (1896), 83–92; "the Conditions Which Influence the Appearance of Toxin in Cultures of the Diphtheria Bacillus," in Transactions of the Association of American Physicians, 11 (1896), 37–61; "The Relation of Dextrose to the Production of Toxin in Bouillon Cultures of the Diphtheria Bacillus," in Journal of Experimental Medicine, 4 (1899), 373–397; "The Antitoxin Unit in Diphtheria." in Journal of the Boston Society of Medical Sciences, 5 (1900), 1–11; "The Degree and Duration of Passive Immunity to Diphtheria Toxin Transmitted by Immunized Female Guinea-pigs to Their Immediate Offspring," in Journal of Medical Research. n.s. 11 (1907), 359–379; and "Active Immunity Produced by So-called Balanced or Neutral Mixtures of Diphtheria Toxin and Antitoxin," in Journal of Experimental Medicine, 11 (1909), 241–256.

Other fundamental contributions to immunology are "On a New Method of Producing Immunity From Contagious Diseases.'" in Proceedings of the Biological Society of Washington, 3 (1886), 29–33. and "Experiments on the Production of Immunity by the Hypodermic Injection of Sterilized Cultures," in Transactions of the IX International Medical Congress, Washington, 3 (1887), 403–407, both written with D. E. Salmon; "The Agglutination Affinities of Related Bacteria Parasitic in Different Hosts," in Journal of Medical Research, n.s. 4 (1903), 270–300, and "The Non-identity of Agglutinins Acting Upon the Flagella and Upon the Body of Bacteria," ibid., n.s. 5 (1903). 89– 100, both written with A. L. Reagh: "Agglutination Affinities of a Pathogenic Bacillus From Fowls (Fowl Typhoid) Bacterium sanguinarium, Moore) With the Typhoid Bacillus of Man," ibid., n.s. 26 (1915), 503–521, written with C. Ten Broeck; "The Significance of Colostrum to the New-born Calf," in Journal of Experimental Medicine, 36 (1922), 181–198, written with R. B. Little; and "The Relation of the Capsular Substance of B. coli to Antibody Production," ibid., 48 (1928), 351–361.

His studies on the properties and differentation of new or unusual bacterial species include "A New Chromogenous Bacillus," in Proceedings of the American Association for the Advancement of Science, 34 (1885), 303–309, written with D. E. Salmon: "The Bacterium of Swine Plague," in American Monthly Microscopical Journal, 7 (1886), 204–205: "A Contribution to the Study of the Microbe of Rabbit Septicaemia," in Journal of Comparative Medicine and Surgery, 8 (1887), 24–37; "Zur Unterscheidurtg z wise hen Typhus- und Kolonbicillen," in Centralblatt für Bakterlohgie und Parasitenkunde (Original-Mittheilung), 11 (1892), 367–370; "On a Pathogenic Bacillus From the Vagina of a Mare After Abortion," in Bulletin. Bureau of Animal Industry United States Department of Agriculture, no. 3 (Washington, 1893), 53–59; "Spontaneous Pseudo-tuberculosis in a Guinea-pig, and the Bacillus Causing It," in Journal of the Boston Society of Medical Sciences, 1 (1897), 5–8; "Ueber die pathogens Wirkung des Bacillus abortus Bang," in Centralblatt für Bakteriologie Parasitenkunde und Infektionskrankheiten,I . Abteilung (Originale), 61 (1912), 549–555; "A Pleomorphic Bacillus From Pneumonic Lungs of Calves Simulating Actinomyces," in Journal of Experimental Medicine, 28 (1918), 333–344; "Spirilla Associated With Disease of the Fetal Membranes in Cattle (Infectious Abortion)," ibid., 701–719; "Some Cultural Characters of Bacillus abortus (Bang) With Special Reference to CO2 Requirements," ibid., 40 (1924), 219–232; "Studies on a Paratyphoid Infection in Guinea Pigs," ibid., 45 (1927), 353–363, 365–377, written with J. B. Nelson; and "Studies on Pathogenic B. coli From Bovine Sources," ibid., 46 (1927), 123–131, written with R. B, Little.

Smith's persistent concern with bacterial variation is apparent from "On the Variability of Pathogenic Organisms, as Illustrated by the Bacterium of Swine-plague," in American Monthly Microscopical Journal, 7 (1886), 201–203; "Observations on the Variability of Disease Germs," in New York Medical Journal, 52 (1890), 485–487; "Modification. Temporary and Permanent, of the Physiological Characters of Bacteria in Mixed Cultures," in Transactions of the Association of American Physicians, 9 (1894), 85–106; "Variations Among Pathogenic Bacteria," in Journal of the Boston Society of Medical Sciences, 4 (1900), 95–104; "Animal Reservoirs of Human Disease With Special Reference to Microbic Variability," in Bulletin of the New York Academy of Medicine, 2nd ser., 4 (1928), 476–496; and "Koch's Views on the Stability of Species Among Bacteria." in Annals of Medical History, n.s. 4 (1932), 524–530.

His pioneering work on the bacteriological analysis of water is expressed in "Some Recent Investigations Concerning Bacteria in Drinking Water,"in Medical News, 49 (1886), 399–401; "Quantitative Variations in the Germ Life of PotomacWater During the Year 1886," ibid., 50 (1887), 404–405: "The Relation of Drinking Water to Some Infectious Diseases," in Albany Medical Annals, 9 (1888), 297–302; "On Pathogenic Bacteria in Drinking Water and the Means Employed for their Removal," ibid., 13 (1892), 129– 150; "A New Method for Determining Quantitatively the Pollution of Water by Fecal Bacteria," in New York State Board of Health. Thirteenth Annual Report for the Year 1892 (1893), 712–722; "Notes on Bacillus coli communis and Related Forms, Together With Some Suggestions Concerning the Bacteriological Examination of Drinking-water," in American Journal of the Medical Sciences, 110 (1895), 283–302; and "Water-borne Diseases," in Journal of the New England Water Works Association, 10 (1896), 203–225.

On other aspects of sanitation he wrote "Recent Advances in the Disinfection of Dwellings as Illustrated by the Berlin Rules," in New York Medical Journal. 48 (1888), 117– 120; "The Sanitary Aspects of Dairying," in Maine Farmer (15 Dec. 1898), 1, 4; "The House-fly as an Agent in the Dissemination of Infectious Diseases," in American Journal of Public Hygiene, n.s. 4 (1908), 312–317; "What Is Diseased Meat and What Is Its Relation to Meat Inspection?," ibid., n.s. 5 (1909), 397–411; and "Insects as Carriers of Disease," in Monthly Bulletin of the State Board of Health of Massachusetts,5 (1910), 112– 119.

The scope and duration of Smith's work in parasitology is exemplified by "Some Observations on Coccidia in the Renal Epithelium of the Mouse," in Journal of Comparative Medicine and Surgery, 10 (1889), 211–217; "Preliminary Observations on the Microorganism of Texas Fever," in Medical News, 55 (1889), 689–693; "Some Problems in the Etiology and Pathology of Texas Cattle Fever, and Their Bearing on the Comparative Study of Protozoan Diseases," in

Transactions of the Association of American Physicians, 8 (1893), 117–134; "An Infectious Disease Among Turkeys Caused by Protozoa (Infectious Entero-hepatitis)," in Bulletin, Bureau of Animal Industry. United States Department of Agriculture, no. 8 (1895), 7–38: "The Etiology of Texas Cattle Fever, With Special Reference to Recent Hypotheses Concerning the Transmission of Malaria," in New York Medical Journal, 70 (1899), 47–51; "The Etiology of Malaria With Special Reference to the Mosquito as an Intermediate Host," in Journal of the Massachusetts Association of Boards of Health, 11 (1901), 99–113; "The Production of Sarcosporidiosis in the Mouse by Feeding Infected Muscular Tissue," in Journal of Experimental Medicine, 6 (1901), 1-21; "On a Coccidium (Klossiella muris, gen. et spec, nov.) Parasitic in the Renal Epithelium of the Mouse," ibid., 6 (1902), 303–316, written with H. P. Johnson; "The Sources, Favoring Conditions and Prophylaxis of Malaria in Temperate Climates, With Special Reference to Massachusetts," in Boston Medical and Surgical Journal, 149 (1903), 57–64, 87–92, 115–118, 139–144, the Shattuck lecture: "Some Field Experiments Bearing on the Transmission of Blackhead in Turkeys," in Journal of Experimental Medicine, 25 (1917), 405–414; "Coccidiosis in Young Calves," ibid., 28 (1918), 89–108; and "Encephalitozoon cuniculi as a Kidney Parasite in the Rabbit," ibid., 41 (1925), 25–35.

Technological innovations and elucidations are reported in "A Few Simple Methods of Obtaining Pure Cultures of Bacteria for Microscopical Examination," in American Monthly Microscopical Journal, 7 (1886), 124–125; "The Fermentation Tube With Special Reference to Anaërobiosis and Gas Production Among Bacteria," in Wilder Quarter-Century Book 1868–1893 (Ithaca, 1893), 187–233; "Ueber die Bedeutung des Zuckers in Kulturmedien für Bakterien," in Centralblatt für Bakteriologie und Parasitenkunde, I . Abteilung (Originale), 18 (1895), 1–9: "A Modification of the Method for Determining the Production of Indol by Bacteria," in Journal of Experimental Medicine, 2 (1897), 543–547; and "One of the Conditions Under Which Discontinuous Sterilization May be Ineffective," ibid., 3 (1898), 647–650,

The Great Influenza: The Epic Story of the Deadliest Plague in History - John M. Barry (2004)

Part VII. THE RACE

Chapter 24

2004-the-great-influenza-john-m-barry-from-publicism-info-chapter-24

WHILE PARK TRIED to produce an antiserum or vaccine against the disease in New York, Philadelphia was already approaching collapse. Its experience would soon be echoed in many cities around the country.

There **Paul Lewis** was searching for the answer as well. Few, including Park, were more likely to find it. The son of a physician, Lewis grew up in Milwaukee, went to the University of Wisconsin, and finished his medical training at Penn in 1904. Even before leaving medical school he knew he intended to spend his life in the laboratory, and he quickly acquired both a pedigree and a well-deserved reputation. He started as a junior investigator working on pneumonia under Welch, Osler, Biggs, and several others who comprised the Rockefeller Institute's Board of Scientific Advisers. **Lewis impressed them all. Most impressed was Theobald Smith, one of the world's leading bacteriologists, for whom Lewis then worked in Boston. Later Smith recommended Lewis to Simon Flexner, saying that Harvard lacked the resources to allow Lewis to develop fully and that "[h]is heart lies in research."**

From Smith there could come no higher compliment. Lewis deserved it. He seemed born for the laboratory. At least that was the only place where he was happy; he loved not only the work itself but the laboratory environment, loved disappearing into the laboratory and into thought. "Love" was not too strong a word; his passions lay in the lab. At Rockefeller, Lewis had started off pursuing his own ideas but when a polio epidemic erupted Flexner asked him to work with him on it. He agreed. It was a perfect match. **Their polio work was a model combination of speed and good science. They not only proved that polio was a viral disease, still considered a landmark finding in virology, but they developed a vaccine that protected monkeys from polio 100 percent of the time. It would take nearly half a century to develop a polio vaccine for humans. In the course of this research Lewis became one of the leading experts in the world on viruses.**

Flexner pronounced Lewis "one of the best men in the country,...a very gifted fellow." That may have been an understatement. **Richard Shope worked closely with him in the 1920s, knew many of the world's best scientists (including Flexner, Welch, Park, Williams, and many Nobel laureates)—and himself became a member of the National Academy of Sciences. He called Lewis the smartest man he ever knew.** Joseph Aronson, a prize-winning University of Pennsylvania scientist who had also done research at the Pasteur Institute, named his son after Lewis and, like Shope, said Lewis was the brightest man he had ever met.

When the war began, Pearce, the National Research Council official, told Lewis what he told only four or five other scientists in the country: to expect to be asked "for special service in connection with epidemic disease." [Richard Pearce was the head of the National Research Council's section on medicine. Pearce was grabbing at any information he could get from the French, the British, even the Germans, and distributing it to investigators everywhere.... see Chapter 23...]

Lewis was ready. He received a navy commission and told Flexner he had "no onerous routine duties." His laboratory abilities were far more important. He was still cooperating with Cole and Avery on the development of pneumonia serum, and he was also, as he told Flexner, experimenting with dyes "as regards their capacity to inhibit the growth" of the bacteria that cause tuberculosis. The idea that dyes might kill bacteria was not original with him, but he was doing world-class work in the area and his instincts were right about its importance. Twenty years later a Nobel Prize would go to Gerhard Domagk for turning a

dye into the first antibiotic, the first of the sulfa drugs.

But now the city did not need laboratory breakthroughs that deepened understanding. It needed instant successes. Lewis had reached his conclusions about polio with tremendous speed—roughly a year, and they had been both sound and pioneering conclusions. But now he had only weeks, even days. Now he was watching bodies literally pile up in the hospital morgue at the Navy Yard, in the morgues of civilian hospitals, in undertaking establishments, in homes.

[Lewis] remembered Flexner's work on meningitis during an epidemic of that disease. Flexner had solved that problem and the success had made the reputation of the Rockefeller Institute. Knowing that Flexner had succeeded then made a solution to this seem possible. Perhaps Lewis could do the same.

He considered whether a filter-passing organism caused influenza. But to look for a virus Lewis would have to look in darkness. That was science, the best of science—at least to look into the gloaming was—but he was not now engaged only in science. Not right now. He was trying to save lives now. **He had to look where there was light. First, light shone on a kind of blunt-force use of the immune system. Even if they could not find the pathogen, even if they could not follow normal procedures and infect horses with the pathogen and then prepare the blood from horses, there was one animal that was suffering from the disease that was scorching its way across the earth. That animal was man.**

Most people who contracted the disease survived. Even most people who contracted pneumonia survived. It was quite possible that their blood and their serum held antibodies that would cure or prevent disease in others. Lewis and Flexner had had some success using this approach with polio in 1910. In Boston, Dr. W. R. Redden at the navy hospital also remembered, as he reported, "the experimental evidence presented by Flexner and Lewis with convalescent serum from poliomyelitis." Now Redden and a colleague drew blood from those who had survived an influenza attack, extracted the serum, and injected it into thirty-six pneumonia patients in a row, beginning October 1. This was not a scientific experiment with controls, and in a scientific sense the results proved nothing. But by the time they reported the results in the October 19 JAMA, thirty patients had recovered, five were still undergoing treatment, and only one had died.

Experiments began in Philadelphia using both the whole blood and serum of survivors of influenza as well. These too were not scientific experiments; they were desperate attempts to save lives. If there was any sign this procedure worked, the science could follow later.

Lewis let others conduct that blunt-force work. It took no truly special skills, and others could do it as well as he. He spent his time on four things. He did not do these things sequentially. He did them simultaneously, moving down different paths—setting up experiments to test each hypothesis—at the same time.

First, he tried to develop an influenza vaccine using the same methods he had used against polio. This was a more sophisticated version of the blunt-force approach of transfusing the blood or serum of influenza survivors. For he at least suspected a virus might cause influenza.

Second, he stayed in the laboratory following a shimmer of light. As Park had reasoned, so Lewis reasoned. Research could find bacteria. Pfeiffer had already pointed an accusing finger at one bacillus. Lewis and everyone in his laboratories were working hours and days without relief, taking only a few hours off for sleep, running procedure after procedure—agglutination, filtration, transferring culture growths, injecting laboratory animals. His team too searched for bacteria. They took more swabs from the throats and noses of the first victims, exposed the medium to it, and waited. They worked intensively, twenty-four hours a day in shifts, and then they waited, frustrated by the time it took bacteria to grow in the cultures, frustrated by the number of cultures that became contaminated, frustrated by everything that interfered with their progress.

In the first fifteen cases, Lewis found no B. influenzae. Ironically, the disease had exploded so quickly, spreading to hospital staff, that Lewis had little except sputum samples to work with: "The hospitals were so depleted [of staff]…I have had no autopsy material" except from four "badly decomposed" bodies, almost certainly too long dead to be of any use.

Then, like Park and Williams, Lewis adjusted his techniques and did begin to find the bacillus regularly. He gave this information to Krusen, the health commissioner. The Inquirer and other newspapers, desperate to say something positive, declared that he had found the cause of influenza and "armed the medical profession with absolute knowledge on which to base their campaign against the disease."

Lewis had no such absolute knowledge, nor did he believe he had it. True, he had isolated B. influenzae. But he had also isolated a pneumococcus and a hemolytic streptococcus. Some instinct pointed him another direction. He began third and fourth lines of inquiry. The third involved shifting his dye experiments from trying to kill tuberculosis bacteria to trying to kill pneumococci.

But death surrounded him, enveloped him. He turned his attention back to helping produce the only thing that might work now. After the emergency, if anything seemed to work he could always return to the laboratory and do careful, deliberate experimentation to understand it and prove its effectiveness.

So he chose as his targets the bacteria he and others had found. From the first instant he had seen the dying sailors, he had known he would have to begin work on it now. For even if he had guessed right, even if what he was doing could succeed, it would take time to succeed. So, in his laboratory and in other laboratories around the city, the investigators no longer investigated. They simply tried to produce. There was no certainty that anything they produced would work. There was only hope.

He started by preparing medium using beef peptone broth with blood added, and then growing cultures of the pathogens they had isolated from cases—B. influenzae, Types I and II of the pneumococcus, and hemolytic streptococcus. He personally prepared small batches of vaccine including these organisms and gave it to sixty people. Of those sixty, only three people developed pneumonia and none died. A control group had ten pneumonias and three deaths.

This seemed more than just promising. It was not proof. Many factors could explain the results, including random chance. But he could not wait for explanations.

His laboratory had no ability to produce the immense quantities of vaccine needed. It required an industrial operation. They needed vats to grow these things in, not petri dishes or laboratory flasks. They needed vats like those in a brewery.

He handed off this task to others in the city, including those who ran the municipal laboratory. It would take time to grow enough for tens of thousands of people.

The whole process, even in its most accelerated state, would take at least three weeks. And it would take time once they made the vaccine to administer it to thousands and thousands of people in a series of injections of increasing doses spaced several days apart. In all that time, the disease would be killing.

Meanwhile, Lewis began work on still a fifth line of inquiry, making a serum that could cure the disease. This work was trickier. They could make a vaccine with a shotgun approach, combining several organisms and protecting against all of them. (Today vaccines against diphtheria, pertussis—whooping cough—and tetanus are combined in a single shot; a single shot protecting against measles, mumps, and rubella is routinely given to children; and today's flu shots contain vaccines against both the influenza virus and pneumococci—and the pneumococcal vaccine is a descendant of the work done at Rockefeller Institute

contain vaccines against both the influenza virus and pneumococci—and the pneumococcal vaccine is a descendant of the work done at Rockefeller Institute in 1917.)

A serum had to aim at only one specific target; if it worked at all, it would work only against a single organism. To make a serum that worked, Lewis would have to pick a single target. If he had to aim at a single target, he had to choose the bacillus Pfeiffer had discovered, B. influenzae. It was still by far the most likely cause of the disease.

Developing a serum against this organism would likely be difficult. While Lewis was still at the Rockefeller Institute, Flexner himself had tried to do this in collaboration with Martha Wollstein. Wollstein—a fine scientist, although Flexner never treated her with the respect he gave to others—had experimented with B. influenzae almost continuously since 1906. But Flexner and she had made no progress whatsoever. They had not only failed to develop a serum that could help man; they had failed to cure any laboratory animals.

Lewis never understood precisely where Flexner had gone wrong in that attempt, although it certainly would have been the subject of many talks in the famous lunchroom where solutions to so many scientific problems were suggested. Now he had no opportunity to think deeply about the problem, think all the way through it, come up with a hypothesis with explanatory power, and test it.

Lewis could only hope that Flexner failed because his technique was faulty. That was quite possible. Flexner had sometimes been a little sloppy in the laboratory. He had once even conceded, "Technically, I am not well-trained in the sense of meticulous and complete accuracy."

So now Lewis hoped some technical error—perhaps in the preparation of the medium, perhaps in too rough a usage for the killed bacteria, perhaps somewhere else—accounted for Flexner's problems. It might have. For example, many years later a young graduate student entered a laboratory and saw a renowned Harvard professor at the sink washing glassware while his technician was perfoming a complex task at the workbench. The student asked him why the technician was not washing the glassware. "Because," the professor replied, "I always do the most important part of the experiment and in this experiment the most important thing is the cleanliness of the glassware."

Lewis turned all his attention in effect to washing the glassware, to the most mundane tasks, making certain there would no mistakes in the work itself, at the same time applying any knowledge about Pfeiffer's bacillus that had been learned since Flexner's failure.

Lewis knew full well that little of what he was doing was good science. It was all, or nearly all, based on informed guesswork. He only worked harder.

As he worked, the society about him teetered on the edge of collapse.

Dr. Anna Lenore Skow Southam (born 1915)

[HG00BZ][GDrive]

Born 1915

Died 1996

Married to **Dr. Chester Milton Southam (born 1919)**

Biography, from US NIH - "Dr. Anna Lenore Skow Southam : 1915 - 1996"

Source : [HG00BY][GDrive]

Dr. Anna Lenore Skow Southam conducted extensive research and published widely in the area of reproductive health, infertility, and sterility, and performed some of the earliest clinical evaluations of a rapid immunological pregnancy test.

Little is known about her early life, or her decision to embark on a career in medicine. Born Anna Lenore Skow in 1915 and raised in Northern Idaho, she earned her bachelor of science degree from the University of Idaho in 1942. After she married Dr. Chester M. Southam, she and her husband ran a laboratory at Idaho's Moscow Hospital. She began graduate studies around this time and was accepted into the pre-medical program at the Columbia University College of Physicians and Surgeons in New York City, and earned her medical degree in 1947. Following a year-long internship at Bellevue Hospital, she took the position of assistant resident at the Sloane Hospital for Women from 1947 and 1953.

During her time at the Sloane Hospital, Dr. Southam began publishing the results of her early clinical research. This was focused on reproductive problems in women, particularly the endocrinological aspects of infertility. At the end of her residency in 1953, she became a research assistant in the Department of Obstetrics and Gynecology at Columbia, and accepted the position of assistant obstetrician and gynecologist at the Columbia-Presbyterian Medical Center. In 1959, Dr. Southam received her diplomate from the American Board of Obstetrics and Gynecology. She maintained a lengthy affiliation with Columbia University College of Physicians and Surgeons and Columbia-Presbyterian Hospital, eventually becoming associate professor of obstetrics and gynecology at Columbia University and an associate attending obstetrician and gynecologist at Columbia-Presbyterian Medical Center.

Dr. Southam recorded her research on fertility and sterility in dozens of articles and published regularly in the Sloane Hospital Bulletin. At the same time, she directed the Sloane Hospital Endocrine Clinic at Columbia-Presbyterian for many years, where she cared for women who had difficulty becoming pregnant. Southam worked on testing oral contraceptives as well as testing drugs for inducing ovulation. Notably, she performed the early clinical evaluation for a rapid immunological test for pregnancy. Accounts of her clinical work appeared in the American Journal Obstetrics and Gynecology, Fertility and Sterility, and the Journal of the American Medical Association.

Throughout her career, Dr. Southam volunteered for service on a number of professional committees, including Planned Parenthood, the Human Betterment Association, and the National Committee on Maternal Health. Continuing her public service until late in her career, she embarked on a six-week teaching tour that took her to Taiwan in the early 1960s, followed by a six-month tour of duty as a visiting professor at the All-India Institute for Medical Research. In these roles Dr. Southam worked under the auspices of the Ford Foundation's Population Office, for which she lectured widely and conducted research on population control. Although she retired from Columbia University and Columbia-Presbyterian in 1967, she continued her work for the Ford Foundation for several more years. Shortly after she ended her career in medicine, she wrote a note to the Alumni Office at the University of Idaho, providing a rare glimpse into her personal life. Noting that she enjoyed looking back over the past, Dr. Southam described herself at the age of 76 sitting in her apartment in Santa Monica, California, playing with her grandchildren and admiring the ocean at her front lawn. After savoring her well-deserved retirement, Dr. Anna Southam died in November 1994.

2010(est) - Univ. of Cambridge UK research by R.A. Braun : "Agents of Fertility: The Ford Foundations' Fertility Research Program Guided by its Biomedical Advisors"

Source : [HE0030][GDrive]

Written by : Ramona A. Braun, University of Cambridge : PhD candidate, History of Science/Centre for Latin American Studies , Email: contact@handsoninstruments.com

I am most grateful to the RAC as they awarded me a generous grant to investigate the newly acquired archives of the Ford Foundation with respect to their Population Program. During my archival research I investigated the following sources:

1. Oscar Harkavy's office files preserved in 27 boxes
2. Ford Foundation unpublished reports, on paper and on microfilm
3. Ford Foundation "logs" (unsuccessful grant applications) and grants; amongst these, I processed all cases and projects advised by A. Southam and E. Witschi

My stay in September to October 2013 focussed specifically on the Ford Foundation's efforts to play an important rôle in the field of population politics by building and maintaining a well supported and unique individual grant program from 1959 until the 1980s (cf. Hertz 1984). This program focussed on support for physiological investigations into the reproductive organs in order to find new ways and means for contraceptive measures. My own interest was specifically on the first half of this period, 1959 to the mid-1970s, as it was in this period that the FF Population Program had the largest international impact (on the early Ford Foundation, cf. Walsh and Atwater 2012; Berelson, Anderson, and Harkavy 1965). For the PhD thesis more particularly, I researched the FF's investment in sterilization and laparoscopy.

I acknowledge most helpful support from Lucas Buresch for the Ford Foundation (hereafter FF) as well as Tom Rosenbaum and Beth Jaffe on Rockefeller Foundation related requests.

My research findings will help other historians to define what kind of rôle the FF played in fertility research in comparison to other global actors such as the Population Council and the Rockefeller Foundation, both run by the Rockefeller Family. In a more general perspective, this research helps to reveal the impact civilian and philantropic funding had on political decisions and medical and health innovations in the field of birth control in the 1950s-70s. Research at the RAC supports my argument that specifically after World War II, contraceptive and neo-eugenic innovations and efforts were highly influenced by private foundations in the field who in turn were influenced by individual physicians and scientists.

First, I will outline the theory or rationale of reproductive research presented by the FF for their new Population Program. This will allow to trace the theory on the basis of which the advisors acted and on the basis of which Oscar Harkavy, head of the Population Program, justified his decisions. Second, I will describe the work of two of these advisors, and finally three significant projects in some more detail.

A Program and its Faces: What Did "Reproductive Physiology" Mean for the FF and How Did It Connect to Birth Control?

Oscar Harkavy, an economist by training (Harkavy 1995), chaired the FF Population Program. Harkavy had a crucial role in shaping the profile of the FF's policy and ideology concerning reproduction and its control by medical means – a policy I termed, in my grant application, "Physiology for Contraception". Reproductive physiology was neither a clear term at the time nor an established research field with its institutions. The term and the questions it addressed were unsolved for a long period of time.

Reproductive physiology was investigated both in medicine and in biology. In medicine, the active specialties were mainly gynecology and urology, and the more laboratory-based sub-disciplines of histology and pathology. In biology, researchers came mostly from embryology, endocrinology and institutes of physiology that dealt mostly with cells, nerves, fluids and tissue. The main questions were how all the reproductive organs in women and men functioned at any given time and what their important elements were. While biologists worked on the smaller structures, gynecologists and urologists investigated mainly entire organs such as the tubes, the ovaries, or the sperm ducts in men.

The Ford Foundation became convinced, after a few investigations, that its funding rôle should be that of boosting research on reproductive physiology (whatever the term covered) in order to access new knowledge to create new contraceptives of all possible kinds. In short, research into physiology should lead to better population control.

When Oscar Harkavy started this Population Program, he depended heavily on experts from medicine and the biomedical sciences to get an overview of current research and to help define what the FF should be aiming to fund. In order to progress quickly, he invited some of the most noted fertility and contraception researchers of the United States to present opinion papers on their topics. Their 1959 workshop was an important step in formulating the Population Program.

On 9 June 1959, the FF convened a meeting of experts at the FF headquarters in New York Cityi. Invited to this seminal meeting were Willard Allen, Lewis L. Engel, Reuben G. Gustavsson, Allan T. Kenyon, C.N.H. Long, Warren O. Nelson, and Gregory Pincus. The most prominent participants were Engel from Harvard and Pincus from the Worcester Foundation who had both earlier attracted global attention to their research.

When considering the "state of the field", members of the workshop agreed that "attempts to control conception by steroids" needed additional scientific research. Furthermore, the participants agreed that "the state of present knowledge" did not allow to define "chemical and physical processes" during the "reproductive cycle": reproductive physiology was not clearly understood. This program was completely in tune with research dynamics in the gynecological infertility community described two paragraphs above. Concerning possible avenues for FF research, it was considered obvious that the "list of the 1958 grants of the Population Council's Medical Division" supplied a reliable catalog of the best institutes carrying out research on human reproduction. Members of the FF meeting looked with great expectations towards the Population Council's budget for 1959 (on the interdependence between Pop Council and FF, cf. The Population Council 1965, 1978; Huang 2011; most recently Abrahamson 2013).

With regard to the papers given, G. Pincus described his Puerto Rican field trials and he was eager to state that the Pill was safe to take: "many of the reported side effects […] diminish with time of use". There were no "pathological side effects". Under the heading of "Obstacles of Research", it was discussed that the "principal obstacle is the lack of trained personnel", especially MDs in comparison to PhDs. It was mainly PhDs in "biochemistry and physiology" who "carried" the field. The group identified a particular obstacle to clinical research by MDs in the liability of physicians for any "unforeseen adverse consequences" of experiments in the United States.

The meeting's report underlined that organizations including the government spent $900,000 per year on medical research geared towards population control, of which $215,000 was provided by the Population Council. However, the FF deplored that the NIH, for instance, only supported research explicitly not related to birth control.

The FF program also identified "investigators overseas" as a possible group of grantees, especially with regard to the situation in the medical disciplines. In conclusion, the FF decided to support bio-medical efforts in a broad sense, be it MDs or PhDs, who worked on the physiology of reproduction, or more directly on birth control methods.

By 1969, the focus had shifted somewhat. Experience with working with MDs made the FF define the research to be carried out no longer as "physiology" but as "biology". The "Foundation strategy" communicated in 1968ii declared: "We continue to assign highest priority to a greatly expanded worldwide program in reproductive biology directed toward the development of radically new concepts in fertility control. Our estimate of $ 150 million a year as an optimum level of support for biomedical research in fertility control is taken seriously by responsible government officials." The FF would contribute to these efforts a budget of $ 8 million in fiscal year 1969.

The emphasis on physiology in 1959 and on biology in 1968 shows that there was a gradual shift in understanding reproductive research within the FF. It is likely that over the years, the more biologically oriented projects looked more promising. Margaret Rossiter's research at the RAC in 2012 (Rossiter 2012) identified a similar change of mind in Warren Weaver, the Rockefeller Foundation's program director responsible for biomedical sciences and one of the main actors in defining "physiology" for the twentieth century. During his lifetime, Weaver became more favourably inclined towards funding projects in the history of science. Likewise, Harkavy shifted from the term "reproductive physiology", in the 1950s much more medical than biological in definition, to the term "reproductive biology".

[....]

Anna L. Southam and her Impact on the Ford Foundation's Funding Patterns

Anna L. Southam (1915-1996) was the FF's second medical/scientific advisor and supported some projects in her own sphere of interest just like Witschi did. She started this position in 1965 and in 1968, Southam broadened the scope of her work becoming responsible for projects in Asia, together with Lyle Saunders.xvii

It is noteworthy here that she is one of the few female fertility researchers, alongside Sophia Kleegman also based at New York and Elizabeth Palmer (wife of the eminent Raoul Palmer) in Paris, who were part of the international community of infertility experts in the 1960s.

Besides being a physician at the Columbia College of Physicians and Surgeons, she also worked as a medical advisor to the [Ford Foundation]. At Columbia, Southam was based in Howard C. Taylor's (1900-1985) department who advised the Population Council in clinical matters. One could therefore say that the Columbia College of Physicians and Surgeons/ Department of Obstetrics and Gynecology advised the Rockefeller Foundation and the Ford Foundation. A detailed study of the intricate relations between Columbia and these two or more philanthropic organisations as well as their impact on population control programs is still missing.

Southam had a degree of education with [illegible] at Columbia [illegible] (Interdepartmental Laboratory at Yale) [illegible] for 1950 [illegible]

Southam had made a name for herself, together with her Columbia colleague C. Lee Buxton (later head of department at Yale), as co-author of a 1958 book on infertility (Buxton and Southam 1958) in which both displayed their interest in a specific form of infertility investigation in women, namely culdoscopy. Culdoscopy is an endoscopic technique of viewing the contents of the abdomen and, more specifically, the internal genital organs such as the tubes and ovaries, through a rigid optic tube called the culdoscope. The culdoscope, an instrument which is no longer in use, was a rigid endoscope developed in the 1940s that was inserted through a small incision in the vagina next to the uterus. The physician inserted the culdoscope through the vagina; this vaginal endoscope thus served to look at the tubes and ovaries without surgically having to open the abdomen.

Despite being an alternative to open surgery, enthusiasm for this tool was minimal in the gynecological community interested in infertility: the cumbersome procedure demanded from the woman a so-called knee-chest-position i.e. being on all fours on the operating table. The technique was internationally known after its inventor Decker had described it in the widely read American Journal of Obstetrics and Gynecology (Decker and Cherry 1944). There were a few vocal proponents of the technique in New York where culdoscopy had been developed and at Hopkins (cf. TeLinde 1948; Decker 1952). Anna Southam believed it had a promising future.

It is in this perspective that one needs to see her and the FF's support of a project of operative culdoscopy, culdoscopy used to sterilize women for population control. Starting in 1973, the FF poured hundreds of thousands of dollars into a project of "operative culdoscopy" for female sterilization as a contraceptive method at the University of the West Indies in collaboration with the State University of Floridaxviii. After one decade, both the head of the project and the FF had to acknowledge that they had failed to develop a viable technique of performing sterilization on large numbers of women. The FF also learned that the travel budget for sending staff from Jamaica to Florida had mainly been used for beach holidays.

More interesting than the description of a failed project and the money spent on dubious procedures, is the broader context in which Southam and the described technology operated. The year the project started, 1973, was a point in time when a very different technique of endoscopic surgery had already proven useful in sterilizing hundreds of women in a day, if needed and wanted, for the purpose of population control: laparoscopy.

Laparoscopy is a method in which a rigid endoscope is inserted through an incision below the navel. As an abdominal technique, it has the advantage that the abdominal organs are better visible. The woman can lie on her back rather than being on all fours. Laparoscopy in gynecology had been developed at the same time as culdoscopy, in the 1940s, yet until the late 1960s it had been used in Europe only (widely read books are Frangenheim 1972; Steptoe 1968). From 1967 onwards, the technique was used in the United States. It came with instruments to coagulate and thereby sterilize the tubes, and a handbook that showed how to do it (Steptoe 1968). The method revolutionized population control in developing countries, especially India (a history of the implementation of the technique in India is yet to be written but hints towards it can be found in Connelly 2008).

By 1973, a number of plastic and metal clips were available for tubal sterilization in case the surgeon wanted to avoid, or did not have available the necessary electrical current, to perform coagulation of the Fallopian tubes. This had proven effective in developing countries with poor operating conditions. By 1973, a professional organization called the American Association of Gynecological Laparoscopists (AAGLxix) had formed and hosted its second international meeting in the USA. Southam knew about all this, as did everybody else engaged in population control. Yet Southam chose, with the means at hand, to take a more political stand.

She chose to support research into an alternative technique, a technique that was not likely to be successful but one that she had helped to disseminate in the late 1950s. As a medical advisor to the FF, Southam supported a technique that was close to her heart: operative culdoscopy. It can be debated whether this was compliant with the FF's declared policy of seeking objective external advice. What is more interesting to the history of population policy is that foundation money was used with the intention to change current medical practice and to make political claims, however unrealistic they may have been. Southam used the FF, an agent much more powerful than herself, to have her say in the discussion about mass-sterilizations.

Southam was not against mass-sterilizations, therefore she went with the general flow of gynecologists interested in contraception in the 1960s. Southam wanted to have her own technique, funded through her initiative, implemented by her and, we can suppose, eventually to be named after her if successful. The University of the West Indies served as a risk-free test-area for that technique, and if it failed, this could always have been attributed to untrained personnel. Southam's favoured technique would have a chance to prove itself.

The case of culdoscopy in the West Indies shows two points very clearly: First, the institutional power the FF's advisors had to to effectively approve or reject projects. Second, the fact that a woman in the generally male business of population control did not act in any way different from her male colleagues: she did not put forward any argument concerning the userfriendliness of her technique for women, she did not criticize mass-sterilizations and she did not question the fact that few women were trained in the program supported by her. Southam was not a feminist, and in her pursuit of a technique of her own she mimicked her male counterparts. This finding counters a general trend in the historiography of women in science to describe women as victims of male agency. Southam was not a victim, she was as powerful as her male counterparts. However, she was not interested in strengthening the voice of other women, or of the women subjected to her culdoscopic operations.

Life's Just The Way She Likes: Busy Day At Home And Hospital

By JOAN W. KONNER
(Staff Writer)

The daily schedule of Anna L. Southam, M. D., of Demarest goes something like this:

7 A. M. — Husband, Chester Southam, M. D. brings her coffee and toast in bed.

8 A. M.—Makes household plans for the day; says good-bye to younger children, Lenore (Lenny), 15, a student at Northern Valley Regional High School and Arthur, 5, a kindergartener, (Larry, 19, her oldest child attends Wittenberg College, Springfield, Ohio).

8:30 A. M. — Reports to work at the Columbia Presbyterian Medical Center in New York, where she is associate attending obstetrician and gynecologist at the Presbyterian Hospital and associate professor of obstetrics and gynecology at Columbia University's College of Physicians and Surgeons.

8:30 A. M. to 6:30 P. M. — Working hours: laboratory research, takes charge of the gynecological clinic (infertility and endocrine clinic), teachers medical school classes, conferences with research fellows, office hours, operating room time, and writing.

6:30 P. M. — Leaves for home and hopes that patients do not go into labor at night;

7 P. M. — Time with family.

The woman who carries this giant-sized schedule works, in professional career, for and against the same goal — pregnancy.

Dr. Southam is an authority on the problems of infertility and birth control.

She is co-author of "Human Infertility", and numerous other papers and pamphlets on fertility. She is also a member of the medical advisory council of the Bergen County Planned Parenthood Center, 59 Essex Street, Hackensack.

"The interest in infertility and control of over-fertility go hand in hand," the tall, spare woman with midnight blue eyes and steel gray hair explained. "Actually both situations are two sides of the same coin."

A case in point is her current research product. She and a team of researchers are trying to establish whether antibodies, or factors which work against pregnancy, are present in women who cannot conceive. If such antibodies should ever be proved and isolated, they may someday be used to immunize other persons against pregnancy just as polio virus is now used to prevent polio.

Sitting in her book-lined office in the medical school building, Dr. Southam stated her approach to the problems of infertility.

"I'm antipsychological," she said in her soft-spoken, but direct manner. "I always try to find the reason for infertility.

"Naturally a woman gets frustrated when she cannot become pregnant. She's barred from her calling as an artist would be if he were prevented from painting. But frustration is not the cause.

"We can't always find the cause, and we recognize that the psychological factor is at times important, but it is not a bush to hide behind."

Also like two sides of the same coin, Dr. Southam's career has always gone hand in hand with her family life.

A native of Idaho, she met her husband in college at the University of Idaho. The two attended medical school together at Columbia University, College of Physicians and Surgeons.

She gave birth to her first child 7 days after graduating college, to her second, in her fourth year of medical school, and to her last, after office hours.

By design her daily hours coincide with her husband's. He does cancer research at the Memorial Cancer Research Center, New York.

When Dr. (Mrs.) Southam is home, she is not too tired to be both an indoor and outdoor girl.

"If it's ironing I have to do, I'm beat, but if it's gardening, I'm fine," she said with quiet humor.

She loves to cook (specialty of the house, beef stroganoff), but hates dishwashing. Often on weekends the beds go unmade.

The whole family loves the out-of-doors. They have spent many vacations and weekends on camping and canoe trips.

"When you get up on the rocks, you know no one can get you on the telephone," she admitted.

Dr. Southam describes her life as hectic at times — she recalls the time one of her patients went into labor when she was cooking Thanksgiving dinner for 20 — but said she wouldn't have it any other way.

"I think my husband and I spend more time with our children than people who are home all the time.

"The children know when we're home, they're the important thing.

"Life is just the way I want it," she summed up, "except I'd like more hours in the day."

FOR AND AGAINST PREGNANCY: Dr. Anna Southam of Demarest works in her laboratory at the Columbia Presbyterian Medical Center in New York, to solve the mysteries of infertility and develop new methods of birth control. (The Record photograph.)

Dr. Chester Southam was a a researcher at Memorial Sloan Kettering Cancer Center, pioneered the study of viruses as potential agents to treat cancer. (aka "Virotherapy")

See : Virotherapy : "***Virotherapy*** *is a treatment using biotechnology to convert viruses into therapeutic agents by reprogramming viruses to treat diseases. There are three main branches of virotherapy: anti-cancer oncolytic viruses, viral vectors for gene therapy and viral immunotherapy. These branches utilize three different types of treatment methods: gene overexpression, gene knockout, and suicide gene delivery. Gene overexpression adds genetic sequences that compensate for low to zero levels of needed gene expression. Gene knockout utilizes RNA methods to silence or reduce expression of disease-causing genes. Suicide gene delivery introduces genetic sequences that induce an apoptotic response in cells, usually to kill cancerous growths.[1] In a slightly different context, virotherapy can also refer more broadly to the use of viruses to treat certain medical conditions by killing pathogens."*

Scientific career Fields : oncology

Institutions

- Memorial Sloan Kettering
- Thomas Jefferson University

Chester Milton Southam (October 4, 1919 – April 5, 2002)[1] was an immunologist and oncologist at Memorial Sloan Kettering Cancer Center and Cornell University Medical College; he went to Thomas Jefferson University in 1971 and worked there until the end of his career.[1] **He ran many experiments involving the injection of live cancer cells into human subjects, without disclosing that they were cancer cells, and using subjects with questionable ability to consent, such as incarcerated people and senile patients in long-term care at a hospital.**[2] The New York State Attorney General encouraged the Board of Regents of the University of the State of New York to take away Southam's medical license.[2] Regardless, he went on to be president of the American Association for Cancer Research.

Life

Southam earned a Bachelor of Science degree and a master's degree from the University of Idaho and his medical degree from Columbia University, graduating in 1947.[3] He became an intern at Presbyterian Hospital in New York City in 1947. In the following year he was promoted from clinical fellow to attending physician at the Memorial Hospital for Cancer and also received a promotion from research fellow to full member at the Chief Division Virology/Immunology.[3] He joined the faculty of Cornell's medical college in 1951 and was eventually promoted to full professor.[3]

From the mid-1950s to the mid-1960s, Southam conducted clinical research on people without their informed consent, in which he injected cancer cells (HeLa cells) into their skin, to see if their immune system would reject the cancer cells or if the cells would grow. He did this to patients under his care or others' care, and to prisoners.[4][5] In 1963, doctors Avir Kagan, David Leichter and Perry Fersko of Jewish Chronic Disease Hospital objected to the lack of consent in his experiments and reported him to the Regents of the University of the State of New York which found him guilty of fraud, deceit, and unprofessional conduct, and in the end he was placed on probation for a year.[4][5] Southam's research was conducted in an era when cancer research was closely followed in the mainstream media; his experiments and the case at the Regents were reported in The New York Times.[6][7][8][9][10]

In the 1950s, Southam also tested the West Nile Virus as a potential [virotherapy]; he injected it into over 100 cancer patients who had terminal cancer and few treatment options.[11] This work had some good results and was also reported in The New York Times, but some people he injected got severe cases of West Nile fever; he went on to do further research to see if he could "train" the virus to kill cancer without the common side effects of chemotherapy.[11]

Southam was later elected president of the American Association for Cancer Research.[11] **In 1971, Southam left his positions at Memorial Sloan Kettering and Cornell** and became an attending physician in the Department of Medicine and Head of the Division of Medical Oncology at Thomas Jefferson University Hospital and a professor of medicine at Thomas Jefferson University Medical College; he held these positions until the end of his career in 1979.[3]

[HB006B][GDrive]

I used to believe that the “cancer conspiracy” was an unintentional result of the love of money and that there were really no malicious intentions at its roots. However, due to stories like the three that follow, I believe that I was a bit naïve in my initial assessment of the situation.

In 1931, [**Dr. Cornelius Packard "Dusty" Rhoads (born 1898)**], a pathologist from the Rockefeller Institute for Medical Research, purposely infected human test subjects in Puerto Rico with cancer cells, and thirteen of them died. Despite the fact that Rhoads gave a written testimony stating he believed all Puerto Ricans should be killed, **he later established the U.S. Army Biological Warfare facilities in Maryland, Utah and Panama, and was named to the U.S. Atomic Energy Commission, where he began a series of radiation exposure experiments on American soldiers and civilian hospital patients**.

Then, in **1963, Chester M. Southam** (who injected Ohio State Prison inmates with live cancer cells in 1952) performed the same procedure on twenty-two senile, African-American female patients at the Brooklyn Jewish Chronic Disease Hospital in order to watch their immunological response. He told the patients that they were receiving “some cells,” but conveniently left out the fact that they were cancer cells. Ironically, Southam eventually became president of the American Association for Cancer Research!

In 1981, the **Seattle-based Genetic Systems Corporation** began an ongoing medical experiment called “Protocol No. 126” in which cancer patients at the **Fred Hutchinson Cancer Research Center** in Seattle were given bone marrow transplants that contained eight experimental proteins made by Genetic Systems, rather than standard bone marrow transplants. As a result, 19 human “subjects” died from complications directly related to the experimental treatment. [**MORE on the research in Seattle that may possibly connect to Gates : See Genetic Systems Corporation**] [...]

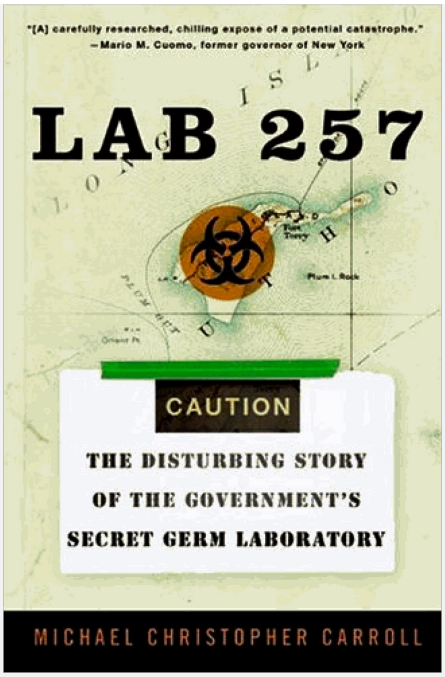
Book by Michael Carroll - [HB0033][GDrive]



cover : [HB005X][GDrive]

"Carroll reports that Yale (Yale Arbovirus Research Unit, or YARU) worked closely with Plum Island on Rift Valley fever virus. Carroll also reports that **the future head of YARU (Shope) had worked with Ft. Detrick in its human experimentation program, Operation Whitecoat. Whitecoat experiments included injecting humans with Rift Valley fever virus (the virus is reported to be 30% fatal) to develop and test vaccines against the virus.**

YARU also had worked on WNV. According to Carroll:

- ***"[Dr. Robert Ellis Shope (born 1929)]'s Yale Arbovirus Research Unit (YARU) across Long Island Sound held twenty-seven different strains of West Nile virus in its New Haven, Connecticut, freezers until 1995, when he moved to the University of Texas and took his strains with him. YARU and Plum often trafficked in viruses, most notably the dangerous Rift Valley fever virus in 1977. Had Dr. Shope shared West Nile virus reference samples with his friend Plum Island director Dr. Roger Breeze--the island laboratory being the only official location where foreign animal germs like West Nile virus are supposed** to be studied?"

[Other reference : YARU moved to Texas, 1994 ... https://www.nytimes.com/1994/11/20/nyregion/yale-viral-lab-to-move-to-texas.html]

Yale later developed the first commercial vaccines for WNV. Chester Southam had injected human subjects in vaccine experments with WNV in the area's surrounding hospitals. Was this part of an Operation Whitecoat project? Did Ft. Detrick or YARU play a role in these human tests similar to that which they played in the Rift Valley virus/Whitecoat Operation? If Yale had WN at the time of the outbreak, did Plum Island? Were they working together on it?

Why AIDS Was Invented

AIDS is proving fantastically beneficial to cancer researchers. In this e-book the author proposes that these benefits are not coincidental and reveals that cancer researchers not only created animal immunosuppressive viruses to do exactly what HIV does but even modified them for growth in human cell cultures, shortly before the epidemic began. Moreover, published human experiments with deadly monkey cancer viruses are exposed and proposed as smaller-scale versions of the cancer experiment which culminated in the useful epidemic of immunosuppression and cancer associated with HIV. The surprising manner in which this catastrophic epidemic is systematically fulfilling the long-term goals of the cancer vaccine establishment—the very group that invented immunosuppressive viruses—is also revealed. For more information on how cancer research is related to AIDS and the Gulf War

AIDS: The "Perfect" Disease

In this study the author argues that AIDS and the associated epidemic of cancer are caused by a type of virus specifically developed and tested by cancer researchers (prior to AIDS) to increase susceptibility to cancer. Moreover, it is proposed that AIDS is the culmination of increasingly sophisticated experiments which were conducted intentionally in animals and humans to induce cancer as a means of developing and testing cancer vaccines. An eye-opening series of published experiments, including one in which immunosuppression was exploited to cause sarcoma tumors in human subjects injected with monkey cancer viruses, is revealed as a precedent for the experiment proposed to explain the explosion of immunosuppression and useful sarcomas in AIDS Evidence is also presented to support the thesis that the AIDS epidemic was deliberately started as an exercise in biowarfare conducted under the cover of an international human cancer experiment. This would explain why the HIV epidemic is selectively depopulating regions of the globe that the national security establishment had targeted for depopulation in the 1970s as a means of maintaining access to resources in the developing world. Additionally, the "cancer vaccine experiment" theory of the origin of AIDS could also explain not only why the AIDS virus selectively depopulates the exact components of the immune system that cancer researchers had been targeting for decades prior to AIDS but why homosexual populations are disproportionately infected by HIV and rare cancers. The relationship between AIDS research and the Gulf War Syndrome are also reviewed in this work.

Why AIDS Was Invented

"As disastrous as the spread of HIV is, the insights that the AIDS epidemic provides into the causes of cancer may ultimately lead to new and successful approaches to cancer prevention." [1]

On the heels of one of medical science's greatest triumphs—the vaccine against polio—researchers pursued the ultimate goal: a vaccine against human cancers. Unfortunately, unlike the case with the poliovirus, there were no known cancer viruses with which to make or test human cancer vaccines. **Therefore, researchers engaged in a crash government program to isolate and characterize animal and human viruses capable of causing human cancer so they could manipulate them into serving as vaccines.** [2] In this long-range human cancer vaccine research program, scientists consistently followed the path that had already led to cancer vaccines in animals. In the effort with animal cancer viruses, **tumor cells were extracted from chemically or radiation-induced tumors and turned into so-called "cell-free filtrates."** These filtrates were then injected into other animals to see if the tumors could be "transplanted." If transplanted tumors successfully grew, the researchers assumed that these injections had contained cancer viruses (since all other cells had been filtered out). [3] As part of this effort, researchers injected these "synthetic" cancer viruses into experimental animals with differing immune system health and genetic backgrounds. This allowed them to observe how viral cancer growth was controlled by the immune response under different host conditions. After watching how the immune system reacted to the injected cancer viruses, researchers were able to develop procedures for artificially boosting the immune system reactions they observed in the form of vaccines. **By manipulating into vaccines the cancer viruses they had created,**

researchers now had a laboratory model for the creation and prevention of viral cancer in animals—they could give lab animals combinations of the experimental cancer viruses and vaccines (based on these or other viruses) they had created to determine the effectiveness of the cancer vaccines. In order to replicate this successful research technique in humans, [4] researchers needed a way to induce human cancer on demand. This would allow researchers to observe cancer growth from its earliest stages [5] as well as develop and test potential human cancer vaccines. As a means of reaching this lofty goal, virologists engaged in a long-running research effort to isolate human cancer viruses from cancer patients using procedures developed in animal research. [6] The cancer-causing potential of these viruses was tested by injecting them in lab animals. In some cases researchers went even further and conducted barbaric human "cancer transplant" experiments in which an array of human and animal cancer cells and viruses were isolated, combined and injected in human subjects to induce and measure tumor growth directly. This gave researchers the opportunity not only to monitor carefully the critical transition from health to cancer growth in human subjects, but also to look for natural immune responses to the initial challenge with cancer which might be artificially amplified with vaccines.

- 1 V. Beral, H. Jaffe, and R. Weiss, "Cancer Surveys: Cancer, HIV and AIDS," Eur. J. Cancer, vol. 27, no. 8, 1991, 1058.
- **2 This program was called the Special Virus Cancer Program.** The goals of this massive government research effort were outlined in its 1967 Progress Report: "The main objectives of this Program are: (1) to determine whether viruses comparable to those now known to be associated with avian and murine leukemia are etiological agents of human leukemia, and (2) to develop an effective vaccine or other means for the prevention and/or control of human leukemia and lymphoma when such etiological agents are found." F. Rauscher and R. Reisinger, Special Virus-Leukemia Program, Progress Report #4, Program Staff, National Cancer Institute, Etiology Area, May 1967, p.1.
- 3 "Un-natural Viruses" Nature New Biology, vol. 230, March 17, 1971, 65, 66.
- 4 Virologists were anxious to extend the cancer vaccine procedures successfully developed for use in animals to man: "It has already been shown that a vaccine prepared against one particular virus will immunize mice not only against that virus but against others as well. …This is important because it shows that (a) animal leukemia can, in fact, be prevented with vaccines and that the causative viruses from which the vaccines were prepared can be attenuated and/or killed by procedures already established for the influenza, polio, and measles diseases of man… This approach may make possible more effective control of the human disease than that attained by drug therapy alone." Special Virus-Leukemia Program, Progress Report #4, p. 14.
- 5 Cancer researchers have long coveted the ability to watch cancer grow from its earliest stages in a large number of human subjects. To this end, human victims of naturally occurring immunosuppressive disorders have been the subjects of numerous monitoring programs in which the relationship between immune system health and cancer could be correlated. By watching people predisposed to cancer, researchers could eliminate the drawbacks of epidemiological studies, in which such correlations were typically made after cancer had already been manifested. R. A. Good, "Relations between Immunity and Malignancy," Proc. Nat. Acad. Sci. USA, vol. 69, no. 4, April 1972, 1026-1032.
- 6 Scientists affiliated with the government's cancer virus program correctly predicted that deadly human cancer viruses would be created using the same techniques by which animal viruses had been isolated and made more potent: "Experience with animal tumor viruses suggests that it may be possible to establish and enhance the disease-inducing potency of candidate particulates from human neoplasma by use of virus passage, concentration and purification procedures. As with murine and avian tumor viruses it must be anticipated that increasing potency of candidate viruses from human and other animal neoplasms will confer on these viruses…" Special Virus-Leukemia Program, Summary Progress Report for the Period September 1964 through June 1965, p. 9. [emphasis added]

A similar procedure had been used in vaccine research for hepatitis (an alleged cancer-causing virus in humans). In this case mentally retarded children were injected with hepatitis so that vaccine researchers could watch the disease progress from its earliest stages. One government investigation described a study "from 1956 to 1972 [by] Dr. Saul Krugman of New York University [who] led a study team at the Willowbrook State School for the Retarded, on Staten Island, New York": **Noting the high incidence of hepatitis among the residents of the school, nearly all of whom were profoundly mentally impaired children and adolescents, Krugman and his colleagues injected some of them with a mild form of hepatitis serum. The researchers justified their work on the grounds that the subjects probably would have become infected anyway, and they hoped to find a prophylaxis for the virus by studying it from the earliest stages of infection.[7]**

Human experiments involving vaccines against hepatitis would continue for years to come and can be tied directly to the outbreak of AIDS in homosexuals chosen for experimental hepatitis vaccine trials shortly before they began dying of previously rare cancers. Vaccines against hepatitis would also later be used in an ambitious international human cancer vaccine experiment (recently declared a success), which will be discussed shortly.

Unfortunately, clues to the hypothesized naturally occurring human immune response to cancer, which might be harnessed for vaccines, proved elusive. Therefore, an indirect way of determining which immune system components were critical in fighting off human cancer was investigated. This effort—which was similar to the approach used in human hepatitis research and animal cancer research—consisted of injecting cancer cells in patients with various immune system deficiencies. **The hope was that if cancer cells grew more consistently in patients with immune system components that were damaged in specific ways, then these components were the keys to fighting off cancer in healthy patients. Follow-up efforts that focused on strengthening these identified components might be the key to training the human immune system to prevent cancer with vaccines.** [8]Thus, it was hoped that if researchers traveled the path through "immunosuppression," it would lead to the ultimate goal of cancer "immunocompetence" in the form of vaccines. [9] In the 1950s researchers began to use this procedure systematically in humans in the same manner it had been used in lab animals. For example, researchers deliberately induced tumors in human subjects with compromised immune systems by injecting them with cancer cells thought to contain human cancer viruses. Clues were sought as to the immune system deficiencies responsible for increased tumor transplant growth by correlating tumor rejection rates with other measures of immune system health. Chester Southam was a leading researcher who published numerous papers describing the use of this technique in human subjects. Southam described his methodology as follows: **The procedure, as I explained, requires simply the hypodermic injection of a suspension of tissue-cultured cells at two sites on the anterior thigh or arm and observation of the sites at about weekly intervals for six weeks or until regression is complete. These cells are of two or more cancer cell lines. These cancer cell lines were chosen because they have the necessary growth capacity to produce a measurable reaction.[10]**

- 8 One author stated the goal: "Here, then, we have a wide possibility: if there is such a biological mechanism as a defense against cancer, then it may be possible to stimulate it either before cancer strikes or perhaps even later when the cancer has taken hold." Earl Ubell, "Injecting Cancer Cells—the Case for the Defense," New York Herald Tribune, January 26, 1964, 29.
- 9 It was in order to generate organisms with various immune system defects for these studies that numerous means of inducing immune system deficiencies (or immunodeficiencies), including the use of viruses designed for this purpose, were eventually developed.
- 10 Jay Katz, Experimentation with Human Beings (New York: Russel Sage Foundation, 1972), 11.

Southam injected hundreds of healthy and diseased patients [11] with "cancer transplants" so he could measure the tumor growth and correlate it with the immune system health of the cancer transplant recipient. [12] One of the results of Southam's dangerous tests was that the tumors he transplanted in healthy human subjects seemed to regress faster with repeated implants while the implants in cancer patients showed less favorable results: **In brief, normal recipients responded to implanted human cancer cells with a marked local inflammatory reaction and rapid complete regression of the implants within a maximum period of 3 to 4 weeks. . . . In striking contrast, however, those recipients that had advanced cancer showed little or no acute inflammatory response, the implanted cancer cells grew progressively for a period of 3 weeks or more before regression started, and some individuals failed to reject implanted cancer cells over periods of observation between 6 weeks and 6 months. [13]**

Southam assumed that the different reactions to cancer injections were due to the differences in the test subjects' immune systems. [14] After watching how these tumor transplants grew in healthy patients, patients with cancer, and patients with diseases other than cancer (at the Jewish Chronic Disease Hospital), Southam claimed cancer patients had an immune system defect that contributed to cancer growth: **All the patients in the study undertaken at the Jewish Chronic Disease Hospital rejected the transplants as promptly as did the healthy persons. Thus it has been demonstrated that cancer patients lack an immune mechanism present in other individuals, including chronically diseased patients.**

- 11 Southam summarized this procedure: "During the past 10 years, as we have seen, cancer cells have been implanted in almost 600 well persons and cancer patients. . . . The technique for measuring immune reactions is now standardized and the results are predictable."

- 12 Southam explained, "Other than the two hypodermic injections and observation of the reaction, the only other procedure would be drawing serum for study of antibody reactions to the transplanted [cancer] cells at approximately two-week intervals during the observation period."
- 13 C. M. Southam and A. E. Moore, "Induced Immunity to Cancer Cell Homografts in Man," Annals of New York Academy of Sciences, vol. 73, 1958, 635.
- 14 "The tumor inoculums survived for longer periods in patients with more advanced cancer. These observations could be explained by variations in the immunological responses of the hosts." [emphasis added] C. M. Southam, "Homotransplantation of Human Cell Lines," Bull. N.Y. Acad. Med., vol. 34, no. 6, June 1958, pp. 416-23.

More specifically, Southam postulated that the reason the cancer patients were more susceptible to tumor growth was due to defective cellular-based immune reactions. [15] Southam also assumed that the reason healthy patients seemed to reject the repeated tumor cell implants with greater efficiency was that they had a natural mechanism for preventing cancer that he was stimulating through injections of controlled amounts of cancer—resulting in an induced immunity. Southam wrote: **The growth of a repeat implant of the same cell type has been studied in normal recipients. The repeated implants formed smaller nodules and regressed more rapidly as judged by gross and microscopic examination. This accelerated rejection of a second implant is presumably the result of an induced immunity.[16]**

Southam hoped that the defense mechanisms against cancer he claimed to be monitoring in these studies might be further manipulated to control cancer growth: **The studies also demonstrated a correlation between the rate of rejection of homotransplanted cancer cells and the patient's apparent ability to restrain his own disease, thus providing additional direct evidence that patients may have immunological (defense) mechanisms to restrain their own cancer. These results, of course, give hope that, through further clinical research, methods of stimulating such mechanisms to greater efficacy can be developed. [17]**

The question was how to make such human cancer vaccines. One of the goals of these tumor transplant studies was to identify potential human cancer viruses in the tumor transplant cells so that these viruses could be tested as vaccines. Chester Southam summarized, "If and when a causative virus of human cancers is found, it may provide a source of antigen for cancer prophylaxis, but this is merely a hope for the future."[18]

- 15 "The immunologic derangement responsible for the comparative slowness of rejection in patients with cancer is still unidentified, but the search is narrowing down and an impairment of cell-associated immune mechanisms now seems probable."
- 16 Ibid.; C. M. Southam, et al.

- 18 C. M. Southam, "Studies of Host Defense Against Human Cancer," Indian J Cancer, vol. 4, no. 1, March 1967, 3-15.

While Southam and other researchers were able to induce tumor growth in human subjects using human tumor transplants,[19] they were not able to identify human cancer viruses in these studies.[20] Researchers had considered the possibility that animal cancer viruses that had acquired the ability to jump the species barrier—like the flu virus—might be responsible for human cancer. If it were true that animal cancer viruses could cause human cancer, then existing animal cancer vaccines might be directly applicable to humans.

As a means of examining this intriguing hypothesis, researchers began to study how cancer viruses from one species could cause cancer in other species. Cancer researchers also began to join cancer viruses from various species and grow them in human cell cultures. [21] They also began to study how animal cancer viruses might cause cancer directly in humans—by injecting human subjects with the animal cancer viruses they grew in cell cultures.

In one of these tests, researchers used a procedure similar to the one that Southam and his colleagues had used in human guinea pigs. However, in addition to injecting subjects with human cancer cell growths (such as the cancer cell line known as HeLa), they also injected a monkey cancer virus known as SV40.

- 19 It was determined after much of this type of human cancer transplant experimentation had been completed, that Southam and his colleagues had conducted many of his experiments on cancer patients at Sloan-Kettering and the Jewish Chronic Disease Hospital in Brooklyn without their consent. The prestigious journal Science published a scathing review of the controversy which ensued (along with an inset of the Nuremberg Code) in which it was revealed that many of the patients involved in the cancer transplant experiments were told only that they would be involved in "skin tests" or that they were to receive "some cells." (Some of these patients were senile and some didn't even speak English.) As the Attorney General of the State of New York noted during an investigation into Southam's experiments in 1964/65: "An analysis of the patients selected amply illustrates that a substantial number of them had not sufficient mental or physical ability to comprehend what was being told to them or what was being done to them; and those who may have had the capacity to understand were not given the full and true nature of the experiment." Louis J. Lefkowitz, Attorney General of the State of New York, Petitioner's Post-Hearing Memorandum, published in: Jay Katz, Experimentation with Human Beings, (N.Y., New York, Russel Sage Foundation, 1972), 45; E. Langer, "Human Experimentation: Cancer Studies at Sloan-Kettering Stir Public Debate on Medical Ethics," Science, vol. 143, 551-553.
- 20 The New York Times summarized the overall situation in 1975 as follows: "[M]ore than 100 different viruses have been proved capable of causing some kind of cancers in some animal species under some circumstances. Many viruses have been suggested as possible causative factors of some cancers in man, but no such case has been proved to date." Harold M. Schmeck Jr., "Scientists Find Virus Linked to Human Leukemia; Diagnostic Value Seen," New York Times, January 9, 1975.
- 21 One example is particularly noteworthy. In this example a rat sarcoma virus (Kirsten sarcoma virus) adapted for human cell growth was combined with a noncancerous baboon virus (a virus known as M7). This pseudotype murine/baboon combination virus proved to have extraordinary characteristics. In addition to being capable of infecting human cell cultures, this pseudotype virus was capable of inducing tumors in a wide range of primates including dogs and monkeys. Since the virus proved so infectious, researchers thought it would readily cause cancer in man. S. S. Kalter and R. L. Heberling, "Primate Endogenous Viruses: Their Role in Oncogenesis and as Biohazards," Joint WHO/IABS Symposium on the standardization of cell substrates for the production of virus vaccines, Geneva, December 1976. Develop. biol. Standard., vol. 37, 219-228.

In a twenty-page paper in the Journal of the National Cancer Institute, researchers published table after table of the results of their attempts to induce tumors with a monkey virus in human subjects (cancer patients) of various ages and in various disease states. **They began by using separate injections of human cancer cells and animal cancer viruses in different regions of the same subject's body. Because initially only the human cancer cell implants resulted in tumors while the SV40 implants did not, researchers began to investigate systematically the mechanism by which the monkey virus SV40 could be made to cause human tumors. Experimental parameters investigated included: the length of time the SV40 was cultured in human cells, the type of human cancer cells the SV40 cancer virus was cultured with, the length of time the recipient subject had been on immunosuppressive drugs, and the dose of cancer virus cells injected.** [22] The experimentation with human subjects using the human cancer cell/monkey cancer virus cultures eventually paid off. Researchers found that by using the right mixture of human cancer cells and the SV40 virus (cultured for the proper length of time and given in sufficient quantities), the SV40 monkey cancer virus could not only reproducibly cause tumors (referred to as "nodules") in human subjects but could also be retrieved in cells removed from induced cancer growths. [23] The authors summarized: **The formation of nodules after . . . implantation of cells from simian virus 40 (SV40) transformed human tissue culture could be correlated with the stages of the transformation process, number of cells implanted, and possibly the presence of infectious virus in the implants.**

While initially the researchers had more difficulty inducing human tumors with the SV40 virus than they did with just human cancer cells (such as HeLa cancer cells), eventually they found the SV40 monkey virus, when mixed and cultured properly, could produce human tumors (characterized as sarcomas) with comparable ease: **Judging by the results of homologous implantation, HeLa cells and late passage, virus-free SV40-transformed cells had a comparable neoplastic potential. Histologically, nodules produced by SV40-transformed human cells were sarcomas.**

- 22 The caption of Table 5 read: "Growth of nodules after homologous implantations of SV40-transformed cultures related to cell dosage and length of time spent in tissue culture after exposure to SV40." The subheading read: "Ratios represent number of sites showing growth of nodules over number of sites inoculated." F. Jensen, H. Koprowski, J. S. Pagano, J. Ponten, and R. G. Ravdin, "Autologous and Homologous Implantation of Human Cells Transformed In Vitro by Simian Virus 40," Journal of the National Cancer Institute, vol. 32, no. 4, April 1964, 922-937.
- 23 In this manner researchers attempted to verify experimentally that the SV40 monkey virus fulfilled Koch's postulates in human cancer growth. This meant that for an agent to be responsible for a disease, 1) it had to be present in all cases of the disease, 2) it had to cause the disease when intentionally placed in healthy subjects, and 3) it had to be present in the intentionally infected subject. J. Cohen, "Fulfilling Koch's Postulates," Nature, vol. 266, 1994, 1647.

Researchers now had a model for inducing cancer in humans using animal cancer viruses. This model allowed them to watch such cancers grow from the earliest stages under laboratory conditions. [24] They also had a model for testing vaccines for this virus, which had already been tested in animals. [25] In yet another series of experiments of this type, but published by different authors, both human cancer patients and test monkeys were injected with a monkey tumor virus known as the Yaba virus. The Yaba virus had been tested in monkeys with the following result: **Intravenous inoculation of virus in the**

rhesus monkey produces widespread tumors in the subcutaneous tissues, skeletal muscle, lungs, and heart and occasionally results in the death of the monkey. [26]

Nevertheless, the virus was injected in human test subjects so that the induced tumors and immune system reactions to the virus could be measured—hopefully identifying an immune response that might be manipulated for use in human cancer vaccines. Following these virus injections, the researchers observed that "the humans developed lesions quite similar to those of the monkeys" and that "inoculation of virus produces only local tumors in the monkey and human." [27]

- 24 One researcher summarized the importance of such a model in developing immunological means of fighting cancer: "We needed to know more about the earliest transforming events if we were ever to be able to make meaningful determinations of specific changes in cells which reflected their conversion to transformed and subsequently to malignant cells. This basic information about early tumor cells is essential also if we are to ever 'unravel' the mystery of the very complex immunologic responses which occur in the host experiencing the cancer event." Joseph H. Coggin Jr., University of South Alabama, Annual Progress Report Contract EE-77-S-05-5601, Report Number ORO-5601-034, Period: August 1, 1978 to May 1, 1979, Project Title: Radiation and Chemical Effects on Viral Transformation and Tumor Antigen Expression.
- 25 Declassified documents from the government's human radiation experiments reveal that researchers had developed methods for inducing "transplantation resistance" to SV40 in animals. One researcher reported, "We could reproducibly detect transplantation resistance and a significant inhibition of tumor development in animals sensitized to an intermediate level of the tumor extract and given a relatively large tumor cell challenge." Human cells infected with SV40 were also tested as vaccines in hamsters. One report stated, "We are able to readily confirm that human cells transformed by SV40 in vitro were capable of interrupting oncogenesis in the hamsters." Were such anticancer measures tested in humans following the development of transplantable SV40 tumors? Report titled: Induction of Transplantation Resistance with Soluble SV40 Induced Hamster TSTA, Joseph Coggin Jr., University of South Alabama College of Medicine. Declassified by the Department of Energy: Internet location: http://tis.eh.doe.gov/ohre/ (12/31/01)
- 26 J. T. Grace and E. A. Mirand, "Human Susceptibility to a Simian Tumor Virus," Annals of the New York Academy of Sciences, v. 108, 1963, 1128.
- 27 Ibid., 1123-1128.

The depraved nature of these experiments is compounded by the fact that the researchers used human beings as walking tissue cultures for the monkey tumor virus they were studying—alternately inducing human tumors through injection of the monkey virus, removing tissue from the induced tumors, re-injecting the virus removed from the human tumors induced, and finally inducing more tumors in other human subjects with the transplanted and processed virus. The authors summarized this process: **A cell-free filtrate of a monkey tumor was injected into three sites on the left forearm, and a tumor suspension into three sites on the right forearm of Patients 1, 2, and 3. Tumors developed at all sites. A single site was excised from the left forearm of Patient 2 at 17 days and from Patient 3 at 10 days. A suspension of each of these tumors was then injected into patient 5. . . . By this method, replication of the virus in the human was established. [28]**

This experimentation in which animal viruses were passaged and tested in human subjects in vaccine research is reminiscent of the Nazi concentration camp studies with typhus. In these experiments "inmates of the camp were infected with typhus for the purpose of procuring a continuing supply of fresh blood taken from persons suffering from typhus." Having a fresh supply of such contaminated blood allowed Nazi doctors to inject patients with disease-causing blood to test vaccines. Some of these vaccines, subsequently tested directly in humans deliberately infected with the pathogenic virus to be vaccinated against, were developed using mouse viruses. As described in the Nuremburg Trials: "Other inmates, some previously immunized and some not, were infected with typhus to demonstrate the efficacy of the vaccines." [29] Active ImmunosuppressionWhile researchers developed ways of causing cancer in animals—and extended these techniques to humans, the specific immune system dysfunctions which supposedly aided cancer growth still eluded them. In addition to injecting cancer cells and viruses into subjects with naturally occurring immune system defects, there was another, more sophisticated way of determining which defects of the immune system resulted in increased cancer growth. This involved developing ways of deliberately inducing such defects so that the immune system damage could be correlated with cancer growth due to cancer transplants. Once again, if certain viruses damaged the immune system and resulted in increased cancer growth, researchers might assume that by boosting the damaged components through vaccines, cancer could be prevented. [30] The procedure for inducing controlled immunodeficiencies allowed researchers the ability to create immune system defects on demand in the laboratory and then measure the transplantability of the cancer viruses they had developed. In addition to allowing them the flexibility of not having to find animals with natural immune system defects, it also allowed them to watch cancer grow from its earliest stages under controlled conditions.

- 29 Trials of War Criminals before the Nuremberg Military Tribunals, Vol. II, (Washington, D.C.: U.S. Government Printing Office, October 1946-April 1949), 267-269. Hereafter Trials of War Criminals.
- 30 Additionally, if there were naturally occurring immunosuppressive viruses that aided cancer growth in this manner, cancer might be immediately reduced by reducing exposure to such cofactors.

This procedure essentially represented a four-step process in cancer vaccine research. The first step would be to inject test subjects with both immunosuppressive agents and cancer agents. The second step would be to determine which induced immune system deficiencies resulted in greater cancer growth. The third step would be to develop means of stimulating these immune system mechanisms. The fourth step would be to test these immune system-stimulating procedures in the presence of cancer injections as a means of evaluating their effectiveness as cancer vaccines. [31] Thus, by carefully inducing immunodeficiency, researchers might ultimately develop immunoproficiency against cancer.

By injecting animals with different immune system-damaging viruses along with different cancer viruses, researchers hoped to identify combinations of immunosuppressive and cancer viruses which might be occurring naturally to cause cancer in humans. [32] Thus, animal immunosuppressive and cancer viruses provided a laboratory model for cancer creation that allowed researchers to mimic processes that they suspected were causing cancer naturally in man.

As part of this research, immunosuppressive viruses with properties amazingly similar to AIDS [33] were created and tested extensively in mice throughout the 1960s.

In these experiments, researchers would inject mice with both sarcoma viruses and immunosuppressive leukemia viruses. [34] Once the leukemia viruses damaged the immune systems of the experimental mice, researchers measured the resulting cancer susceptibility (due to the sarcoma viruses) in the leukemia virus-impaired test subjects. [35]

- 31 This branch of research is actively and successfully pursued in animal cancer research today.
- 32 Similarly, it had been suspected that malaria created an immunosuppressive state in humans, which aided the growth of cancer allegedly caused by the Epstein-Barr virus. To test this hypothesis, researchers injected primates with combinations of a virus capable of inducing Burkitt's lymphoma and agents capable of inducing malaria. The 1967 report of the Special Virus-Leukemia Program noted that such studies were being conducted in monkeys: "A special project in progress involves induction of malaria in the recipient prior to inoculation with Burkitt virus." Special Virus-Leukemia Program, Progress Report #4, p. 21. See also: D. P. Burkitt, "Etiology of Burkitt's Lymphoma–an Alternative Hypothesis to a Vectored Virus," J. Natn. Cancer Inst. 42, 19-28 1969; Whittle, Brown, Marsh, Greenwood, Seidelin, Tighe, Wedderburn, "T-cell Control of Epstein-Barr Virus-Infected B Cells is Lost During P. Falciparum Malaria," Nature, vol. 312, 1984, 449-450.
- 33 One of these viruses, called the Duplan virus, was created by cancer researchers in 1962 by irradiating mouse leukemia viruses. According to an article published in 1989, this virus induces "a severe immunodeficiency disease with striking similarities to human AIDS." D. C. Aziz, Z. Hanna, and P. Jolicoeur, "Severe Immunodeficiency Disease Induced by a Defective Murine Leukaemia Virus," Nature, vol. 338, 6 April 1988, 505-508. Other researchers who tested the nearly forty-year-old virus reported, "This crude virus stock induced a severe immunodeficiency syndrome which has been designated murine acquired immunodeficiency syndrome." M. Huang and P. Jolicoeur, "Characterization of the gag/Fusion Protein Encoded by the Defective Duplan Retrovirus Inducing Murine Acquired Immunodeficiency Syndrome," Journal of Virology, December 1990, 5764-5772.
- 34 For a description of an experiment of this type in mice, see M. A. Chirigos, K. Perk, W. Turner, B. Burka, and M. Gomez, "Increased Oncogenicity of the Murine Sarcoma Virus (Moloney) by Co-infection with Murine Leukemia Viruses," Cancer Research, vol. 28, June 1968, 1055-1063.
- 35 Using methods similar to those used in experiments which were conducted with mice using combinations of leukemia and other cancer viruses, experiments were also conducted with cats from the early 1970s in which attenuated or inactivated feline leukemia viruses were used to induce immunosuppression in R. G. Olsen, E. A. Hoover, J. P. Schaller, L. E. Mathes, and L. H. Wolff, "Abrogation of Resistance to Feline Oncornavirus Disease by Immunization with Killed Feline Leukemia Virus," Cancer Research, vol. 37, July 1977, 2082-2085.

Since immunosuppressive viruses were able to increase cancer growth dramatically in mice and cats, researchers suspected that immunosuppressive viruses were also able to increase cancer growth in humans. [36] **In order to gain a better understanding of the role of immunosuppression in human cancer, researchers began to conduct international studies of humans with immunodeficiency syndromes so they could watch cancer grow from its initial stages and correlate the type of cancer growth with viruses detected and the type of immune system dysfunction observed.** [37] In parallel with cancer studies of naturally occurring immunodeficiency diseases in humans, in the 1970s cancer researchers began growing immunodeficiency viruses they had created for animal studies in human cell cultures. They also combined the monkey virus they had used to induce human sarcoma tumors with these immunosuppressive viruses.

In the 1980s an epidemic of sarcoma cancer due to an animal immunosuppressive virus began to explode in human populations and alert scientists to the impending AIDS epidemic. [38] As it turns out, this cancer epidemic due to AIDS is proving to be highly combination with cancer virus injections. Following the induction of immunosuppression with the modified feline leukemia virus, experimental cats were found to be much more susceptible to cat cancer viruses.

- 36 Immunosuppressive drugs used in kidney transplants resulted in increased cancer rates in humans. This fact, combined with the fact that naturally occurring immunodeficiency diseases also resulted in higher rates of cancer in humans, caused researchers to postulate that the immunodeficiency model in animalswould provide clues to human cancer growth and prevention.
- 37 By watching cancer grow in subjects predisposed to cancer, researchers could learn more about the initial stages of cancer growth (and the factors that caused it) than conducting epidemiological studies in subjects who had already contracted cancer. By watching only those patients known to be predisposed to cancer growth due to naturally occurring immunodeficiencies, the observation time required could be drastically shortened in crucial experiments designed to monitor tumor growth from its very beginning stages. These advantages (for naturally occurring forms of immunodeficiencies) were summarized by Joseph Fraumeni in a National Cancer Institute Monograph as follows: "Future attempts at identifying etiologic agents in human leukemia and lymphoma may involve the longitudinal study of individuals over a period of time that covers the critical phase of tumor induction. Such a project would be extremely difficult to carry out, perhaps impossible, if all persons had an identical risk of developing these otherwise uncommon cancers. Epidemiologic and experimental advantages would result from the use of patients at exceptionally high risk of leukemia and lymphoma, such as those affected with certain constitutional diseases." [emphasis added] Fraumeni also noted, "There are significant advantages to the use of constitutional disorders and other 'high-risk' conditions in laboratory and epidemiologic research on these neoplasms." One of these advantages was that researchers could probe the immune responses of such patients and then correlate the exact form of their deficiencies with cancer growth. J. P. Fraumeni Jr., "Constitutional Disorders of Man Predisposing to Leukemia and Lymphoma," National Cancer Institute Monograph 32, August 1969, 228.
- 38 Lawrence Altman wrote in the New York Times, "It was the sudden appearance of the Kaposi's sarcoma cancer in large numbers of gay men in New York City that led doctors to recognize what is now called AIDS. Until then, Kaposi's sarcoma had been rare, and few experts suspected that it was related to a virus." useful to researchers seeking to develop human cancer vaccines—the group that invented and tested immunosuppressive viruses for this very reason. Lawrence K. Altman, "Surviving With AIDS Is One Problem, Cancer Is Yet Another," New York Times, May 6, 1997.

The Benefits of AIDS

The AIDS virus has allowed cancer researchers to make major breakthroughs—providing long-awaited proof that viruses cause sarcoma in humans [39] and that such cancers can be controlled by the immune system (the so-called immunodeficiency theory of cancer susceptibility). Headlines in the New York Times have announced that long-sought human cancer viruses have finally been isolated from AIDS patients suffering from the most prominent form of AIDS-related cancer called Kaposi's sarcoma.40 **Although it is not known for sure that the virus is totally responsible for the growth of Kaposi's sarcoma in AIDS victims, this fortuitous development is extremely encouraging to those studying the viral causes of human cancers.** Lawrence Altman, writing in the New York Times, recently predicted, "Ultimately, the new findings about the Kaposi's sarcoma virus could help unravel many unknowns about how viruses cause cancers." This line of research, which at long last correlated a herpes virus with the growth of Kaposi's sarcoma in human subjects, [41] encouraged another group of researchers to look for other forms of cancer that might be caused by this same virus. These researchers have recently announced another major breakthrough in viral cancer research—finding a link between this same virus and a common form of blood cancer known as multiple myeloma, the second most prevalent form of blood cancer in the U.S. [42]

- 39 Recall that researchers had been systematically searching for such human cancer viruses for over forty years. Up until the advent of the AIDS epidemic, this search had been in vain. Schmeck wrote in the New York Times in 1975: "... more than 100 different viruses have been proved capable of causing some kind of cancers in some animal species under some circumstances. Many viruses have been suggested as possible causative factors of some cancers in man, but no such case has been proved to date." Schmeck.
- 40 The source of Kaposi's sarcoma, the leading form of cancer that develops in immunosuppressed AIDS patients, has recently been traced to a type of herpes virus. Lawrence K. Altman, "Virus Linked To a Cancer Is Identified: Malignancy Is Found In Gay AIDS Patients," New York Times, March 1, 1996.
- 41 Cancer researchers had long theorized that human cancers could be caused by herpes viruses. One government report summarized in 1967: "The virus or group of viruses most persistently detected and isolated from human leukemia and lymphoma materials is a Herpes-type agent.... This virus appears to be an important candidate for consideration as an etiologic agent of human cancer..." In the 1970s researchers wrote numerous papers speculating on the manner in which such viruses might cause human cancer. AIDS is providing the perfect research vehicle for proving these theories. F. Rauscher and R. Reisinger, Special Virus-Leukemia Program, Progress Report #4, p. 3.
- 42 Lawrence K. Altman, "A Virus Associated With AIDS Is Linked To Appearance of a Common Blood Cancer," New York Times, June 20, 1997.

How fortunate! As a direct result of the rare cancers that form in HIV victims, cancer researchers are gaining insight into the manner in which cancer viruses and viruses which cause immune system impairment interact to cause cancer. And they are able to do this thanks to the same type of viruses which government researchers had isolated, purified and made more virulent and infectious for this very purpose. [43] Lawrence Altman, who has been chronicling the AIDS epidemic through the New York Times, recognized the benefits of AIDS to cancer researcher at the very beginning of the epidemic. Altman predicted that the rare cancer caused by AIDS would provide insight into the causes of other types of cancer: **The sudden appearance of the cancer, called Kaposi's sarcoma, has prompted a medical investigation that experts say could have as much scientific as public health importance because of what it may teach about determining the causes of more common types of cancer. [44]**

This prediction came true. Another researcher more recently summarized how AIDS-related cancers are providing valuable insight into the cause of cancer in general: "The etiology and mechanism of the specific cancers that are increased with HIV infection are proving highly informative for our general understanding of cancer etiology." [45] As a result of this convenient new insight into the mechanisms of cancer growth, researchers are now predicting that the AIDS epidemic and the associated cancer epidemic will assist in the development of cancer prevention strategies. One author suggested, "The AIDS-malignancies have provided insights into the pathogenesis of neoplastic disease in general and into strategies for further therapeutic intervention." [46] Other authors in the European Journal of Cancer summarized the benefits of AIDS to cancer vaccine research in the following manner: **As disastrous as the spread of HIV is, the insights that the AIDS epidemic provides into the causes of cancer may ultimately lead to new and successful approaches to cancer prevention. [47]**

Indeed, the AIDS epidemic appears to be perfectly suited to providing a research vehicle to the viral cancer research effort, which invented immunosuppressive viruses to determine the links between cancer, viruses, and immunodeficiency so that cancer vaccines could be created. One author wrote of the utility of AIDS-related cancers or neoplasms to cancer prevention efforts: **The occurrence of these neoplasms offers an opportunity to study the role of viruses and immunodeficiency in development of these tumors. Also, the pathogenic mechanisms leading to specific malignancies can be elucidated. This information ought to guide development of strategies for prevention of virally determined cancers.[48]**

- 43 Herpes-type viruses were isolated from human cancers and mass-produced to determine their ability to cause cancer as far back as 1967: "The production of herpes-type virus from a culture of the African Burkitt lymphoma has been increased at Chas. Pfizer and Co., Inc. by a substantial increase in the virus content of the culture." Suspected cancer-causing viruses were isolated from humans and injected into various species to assess their cancer-causing potential: "Materials from human patients have already been inoculated into 600 newborn monkeys and chimpanzees of various species, and into large numbers of dogs, cats, mice, hamsters, etc." Special Virus-Leukemia Program, Progress Report #4, pp. 12, 20.

- 46 A. M. Levine, "AIDS-Related Malignancies: the Emerging Epidemic," Journal of the National Cancer Institute, vol. 85, no. 17, September 1, 1993, 1392.
- 47 V. Beral, et al.
- 48 D. T. Purtilo, "Opportunistic Cancers in Patients With Immunodeficiency Syndromes," Arch. Pathol. Lab. Med, vol. 111, December 1987, 1129.

Altman provided a fitting summary of the situation: **. . . scientists saw in the tragedy of the AIDS epidemic an extraordinary opportunity to study the interplay of viruses, an impaired immune system and the development of cancer. In a way, AIDS research was an extension of the war on cancer that the Government declared in 1971.[49]**

It should be clear that the HIV epidemic is providing cancer researchers with extensive knowledge of human cancer viruses and the immune system reactions to them. This knowledge will certainly assist in the development of human cancer vaccines, but HIV itself may even be used in such vaccines if recent animal research is applicable to human cancer prevention. Recent cancer experiments with HIV in animals have shown that the virus can be used not only to cause cancer but to inhibit its growth in the form of cancer vaccines! By using components of HIV in experimental vaccines against tumors (which were induced by modified forms of HIV), researchers have reportedly dissected the role of CD4 and CD8 T-cells in tumor prevention through immunosurveillance. One group of scientists reported, "This model has allowed us to begin to dissect some of the mechanisms mediating and regulating tumor immunosurveillance." The researchers who conducted this experiment optimistically noted that this line of experimentation with HIV "may provide a successful concerted approach to cancer immunotherapy." [50] Whether HIV will be used directly as a cancer vaccine in humans in a similar manner remains to be seen. However, HIV may have much more far-reaching medical uses than cancer vaccines—as stunning as that achievement might be. Specifically, the use of HIV in the brave new world of genetic therapy in humans looks promising.

- 49 Lawrence K. Altman, "The Doctor's World: AIDS Research Yields Clues Linking Viruses and Cancer," New York Times, April 14, 1998.
- 50 S. Matsui, J. Ahlers, A. Vortmeyer, M. Terabe, T. Tsukui, D. Carbone, L. Liotta, and J. Berzofsky, "A Model for CD8+ CTL Tumor Immunosurveillance and Regulation of Tumor Escape by CD4 T Cells Through an Effect on Quality of CTL," Journal of Immunology, vol. 163, no.1, 1 July 1999, 184-193.

Indeed, HIV has the potential to be a very useful experimental and therapeutic virus with broad biomedical applications. [51] Amazingly enough, researchers have begun using the HIV virus itself as a viral "vector" for the controversial line of medicine known as gene therapy—at least in the laboratory. By deleting certain genes in the deadly AIDS virus, researchers have been able to exploit its unique infectious properties while eliminating its harmful capacity. Andrew Pollack wrote in the New York Times: **In a bold but potentially frightening effort to turn one of the world's most virulent killers into a cure, scientists and biotechnology companies are trying to tame the AIDS virus and harness it to treat disease. The scientists say they have stripped the human immunodeficiency virus of its ability to cause disease, while leaving intact its ability to infect human cells. Such a crippled virus, they say, could be used to deliver genes in to human cells for gene therapy. [emphasis added]**

As a result of laboratory tests, the subfamily of viruses to which HIV belongs is thought to be one of those most suited for the emerging technology of genetic therapy. This type of virus, the lentivirus, seems to have infectious properties which render it superior to other viruses for the insertion of genes in human DNA. This includes the DNA of nondividing cells, which pose a barrier to other types of viral vectors. Pollack noted: **H.I.V., on the other hand, is both cunning at evading the body's immune defenses and can carry large genes. Most important, it is one of a small class of viruses, known as lentiviruses, that can incorporate genes into the chromosomes even of nondividing cells. [52]**

This convenient infectious property, together with its carrying capacity, makes HIV one of the more promising ones for use in human clinical gene therapy trials.

It should be clear that the cancer epidemic due to AIDS is proving fantastically beneficial to cancer researchers, but the question needs to be asked: Are these stunning developments merely due to coincidence? Altman had noted, "In a way, AIDS research was an extension of the war on cancer that the Government declared in 1971." Is there more to Altman's comment than meets the eye?

- 51 Cancer researchers are not the only ones who are benefiting from the medical knowledge gained in the fight against AIDS. The entire medical research community stands to reap tremendously useful knowledge from the AIDS catastrophe. Several knowledgeable authors summarized in the medical literature: "Furthermore, an unforeseen dividend for HIV research is the unraveling of the rich, intricate pathways of gene regulation utilized by the virus, which may well illuminate novel, fundamental cellular processes. The understanding of basic biology that we gain from the studies of HIV may be one major legacy of this epidemic to medical science." [emphasis added] Y. N. Vaishnav and F. Wong-Staal, "The Biochemistry of AIDS," Annu. Rev. Biochem,1991, vol. 60, 580.
- 52 Andrew Pollack, "Scientists Enlist H.I.V. To Fight Other Ills," New York Times, January 19, 1999.

Could researchers have caused the AIDS/cancer epidemic using the tools they had developed in the government's war on cancer? Did they continue in their human experiments with cancer-causing monkey viruses and escalate to the use of "active" immunosuppression with the monkey immunosuppressive viruses they developed for animal cancer experiments? In the human experiments with SV40 tumor transplants, researchers mimicked active immunosuppressive experiments that were conducted by Chester Southam in animals. In Southam's animal experiments, he gave mice treatments that disabled their immune systems in an attempt to increase tumor growth due to cancer virus injections. [53] In the SV40 experiments with humans, patients undergoing immunosuppressive treatments for cancer were injected with the cancer-causing monkey virus SV40 to determine both whether such viruses were capable of causing human cancer and whether immunosuppression aided such cancer growth. [54] The SV40 researchers even got to use one of the same immunosuppressive treatments (an immunosuppressive chemical known as Cytoxan) in their human transplant studies [55] that Southam used in cancer transplant studies in mice. [56], [57]

- 53 Southam reported, "It seemed reasonable to test this possibility by studying quantitatively the transplantability of syngeneic tumours under conditions which suppress or enhance immunological responses." J. Reiner and C. M. Southam, "Effect of Immunosuppression on First-Generation Isotransplantation of Chemically Induced Tumours in Mice," Nature, vol. 210, 23 April 1966, 429-430.
- 54 Although a New York Times reporter [Altman] recently noted, "[I]t would be unethical to inject humans with a virus to prove that it can cause cancer," as documented in this work, scientists have conducted numerous experiments using just such a procedure. Lawrence K. Altman, "A Virus Associated With AIDS."
- 55 Some of the human patients used in the monkey virus experiment were undergoing immunosuppressive treatments with Cytoxan for their cancer: "Seventy-five percent of the patients had been given cytotoxic drugs, including cyclophosphamide (Cytoxan), 5-fluorodeoxyuridine, and 5-fluorouracil in full therapeutic doses." Researchers were able to study the injected cancer cell growth as a function of how long it had been since the immunosuppressive treatments had been halted: "[Cancer] Cells were inoculated into patients 1 to 31 days after drug administration was terminated, except for 2 patients who received their last dose of Cytoxan on the day of implantation." F. Jensen, et al.
- 56 Southam explained, "Such an investigation has been undertaken in this laboratory and the results obtained with cyclophosphamide ('Cytoxan') are sufficiently interesting and reliable to merit this preliminary report. Cyclophosphamide ('Cytoxan') was chosen for this study because its immunosuppressive effect had previously been demonstrated in a variety of experimental systems and because its pharmacological characteristics seem well suited to the objective." This chemical had the advantage that it "acts very rapidly after systemic administration to initiate cytotoxic changes, including destruction of those cells responsible for immunological reactions." Conveniently, "if administration of the drug is stopped 24 h or more before a transplant is injected, it results in a host in which immunosuppression will continue for a considerable time, but in which there is no persistence of a cytotoxic drug which might inhibit the tumor transplant." J. Reiner and C. M. Southam, "Effect of Immunosuppression on First-Generation Isotransplantation of Chemically Induced Tumours in Mice," Nature, vol. 210, 23 April 1966, 429-430.
- 57 Experiments similar to these were also conducted in monkeys in which immunosuppression and infection with the SV40 virus were studied to determine the cancer-causing potential of SV40. G. A. Cole and K. V. Shah, "Experimental Simian Virus 40 Infection of Normal and Immunosuppressed Spider Monkeys," Acta virol, vol. 18, 1974, 65-69.

Since cancer researchers routinely used experimental cancer-induction procedures in humans that they developed in animals, it is natural to ask whether, in addition to immunosuppressive chemicals, researchers have also used monkey immunosuppressive viruses in conjunction with SV40 or other cancer virus transplants in humans. Curiously, monkey immunosuppressive viruses were not only available to researchers prior to AIDS but were mixed with the SV40 virus and propagated in human cell cultures! While the public is completely ignorant of this fact, simian immunosuppressive viruses(SIVs) such as the Mason Pfizer Monkey Virus (MPMV)—one of three types of SIV58—were available to researchers as early as 1970 when the virus was grown in cell cultures.59 Well before AIDS, MPMV was shown to induce immunodeficiency states in monkeys in the early 1970s [60][61] as well as the 1980s. [62] In one of these early experiments, MPMV was mixed with SV40—the monkey cancer virus (which had already been injected in humans to cause cancer)—and the Rous

- 58 MPMV is one of "three independent virus isolates" of "simian acquired immunodeficiency syndrome (SAIDS) in macaque monkeys." One group of researchers reported, "When inoculated into young monkeys, MPMV produced a spectrum of nononcogenic disease associated with an immunodeficiency condition." R. M. Thayer, M. D. Power, M. L. Bryant, M. B. Gardner, P. J. Barr, and P. A. Luciw, "Sequence relationships of type D retroviruses which cause simian acquired immunodeficiency syndrome," Virology, 1987 April 157(2), 317-329.

- 59 This immunosuppressive virus was isolated from a mammary tumor of a rhesus monkey in 1970. H. C. Chopra and M. M. Mason, "A New Virus in a Spontaneous Mammary Tumor of a Rhesus Monkey," Cancer Research, vol. 30, no. 8, August 1970, 2081-2086.
- 60 The virus not only had immunosuppressive properties, it was reported to act like a slow virus—just like HIV. D. L. Fine, J. Landon, R. Pienta, M. Kubicek, M. Valerio, W. Loeb, and H. Chopra, "Responses of Infant Rhesus Monkeys to Inoculation With Mason-Pfizer Monkey Virus Materials," Journal of the National Cancer Institute, vol. 54 no. 3, March 1975, 651-658.
- 61 In 1986 one group of researchers described how immunodeficiency states were induced in monkeys in the early 1970s using MPMV. Since the virus did not immediately induce cancer and since AIDS hadn't started in human populations, the effects of the virus (immunosuppression and fatal infection by opportunistic diseases) at that time did not attract widespread notice. The researchers reported in one paper, "However the results were disappointing at that time because tumors were not induced by inoculation of MPMV into newborn rhesus monkeys and other nonhuman primates. Instead, many of the inoculated neonatal animals developed persistent lymphadenopathy, thymic atrophy, and weight loss and eventually died of undue susceptibility to facultative organisms. Because of the absence of transmissible tumor and the lack of occurrence at that time of human AIDS, this nononcogenic but immunosuppressive result attracted little scientific attention." M. L. Bryant, M. B. Gardner, P. A. Marx, D. H. Maul, N. W. Lerche, K. G. Osborn, L. J. Lowenstine, A. Bodgen, L. O. Arthur, and E. Hunter, "Immunodeficiency in rhesus monkeys associated with the original Mason-Pfizer monkey virus," J. Natl. Cancer Inst., 77(4), October 1986, 957-965.
- 62 Cryogenically preserved samples of this virus, isolated in the 1970s, were shown to induce a disease (simian acquired immune deficiency syndrome, SAIDS) very much like that due to simian immunodeficiency viruses (SIVs). The researchers who published the experiment in 1986 stated, "MPMV produces an acquired immunodeficiency similar to that caused by the recently described simian acquired immune deficiency syndrome type D retroviruses." Ibid.

sarcoma virus in human cell cultures.63 Researchers also mixed the immunosuppressive virus with simian sarcoma virus.64 Is it not curious that cancer researchers were mixing immunosuppressive monkey viruses with sarcomas and coaxing them to grow in human cells in the late 1970s—just before HIV broke out in human populations and caused an epidemic of immunosuppression and sarcoma? Could this epidemic have been an extension of the human tumor transplant experiments with SV40, using the technology perfected over decades of research with animal immunodeficiency viruses? If researchers were going to use animal immunosuppressive viruses to conduct such experiments in man, how might they have been conducted? It would make sense for researchers to use vehicles that would allow them not only to inject subjects with viruses but to conduct follow-up studies to see how the immunosuppressive and cancer viruses resulted in immune system destruction [65] and cancer growth. Vaccine programs meet these criteria and are the perfect vehicles for implementing such experiments.

- 63 H. Ogura, T. Tanaka, M. Ocho, T. Kuwata, and T. Oda, "Detection of Mason-Pfizer monkey virus infection by syncytia formation of human cells doubly transformed by Rous sarcoma virus and simian virus 40," Arch Virol, 57(2), 1978, 195-198.
- 64 H. Ogura, "Interactions Among Retroviruses Mason-Pfizer Monkey, Baboon Endogenous, Simian Sarcoma Virus-Associated and Murine Leukemia Detected by Virus-Mediated Cell Fusion Inhibition Assay," Microbiol. Immunol., vol. 24, no. 8, 1980, 761-763.
- 65 Such research would not be unprecedented. A long-running program exploiting unsuspecting black men naturally infected with syphilis was supervised by the government for decades. This program, known as the Tuskegee study, was conducted "to see how the syphilis germ destroys the body. In the late stages, the germ can cause paralysis, gradual blindness and dementia." Sanjay Bhatt, "The anthrax vaccine: Government's shot in the dark," Palm Beach Post, December 30, 2001. In this case, natural cases of syphilis were deliberately left untreated so victims of the disease could be monitored for medical research purposes. A government report summarized the experiment: "By the mid-1940s it was becoming clear that the death rate for the infected men in the study was twice as high as for those in the control group. The study was reviewed by PHS officials and medical societies and reported by a number of journals from the early 1930s to 1970. In the 1960s a growing number of criticisms began to appear, although the study was not stopped until 1973. Thus, men with a confirmed disease were not told of their diagnosis and were deceived into participating in the study under the guise of its being therapeutic for unspecified maladies. In addition to exposing the subjects to the additional harms of participation in the study, the false belief that treatment was being administered prevented subjects from otherwise seeking medical care for their disease. Over this forty-year history, at least 28 participants died and approximately 100 more suffered blindness and insanity from untreated syphilis before the study was stopped." Advisory Committee on Human Radiation Experiments - Final Report, Chapter 3, Section: "The Development of Human Subject Research Policy at DHEW," http://tis.eh.doe.gov/ohre/roadmap/achre/chap3_2.html (12/31/01)

Prior to AIDS, the world's medical elite was well aware of the usefulness of immunosuppressive viruses to cancer research: World Health Organization (WHO) representatives had made statements expressing their desire that the organization get involved in research with immunosuppressive viruses capable of selectively targeting T-cells. [66] (Researchers associated with WHO were optimistic that the immunosuppressive research conducted in animals could be usefully extended to human beings.[67]) Members of WHO had also recommended that experimental agents be placed in vaccines as a vehicle for measuring the human immune response on a global scale68(as a means of separating genetic from environmental determinants of immune system function). A report by a WHO study group had also recommended an international study of naturally immunosuppressed humans with immunological deficiency syndromes for cancer research purposes (this was prior to the emergence of the international Acquired Immunodeficiency Syndrome epidemic)![69] Did WHO achieve all of these goals simultaneously by placing immunosuppressive agents in some of its vaccines, thereby creating a highly useful international epidemic of acquired immunodeficiency syndromes and cancer resulting from selective T-cell depletion? **The possibility that increased cancer rates due to infectious agents present in vaccines would be useful for cancer vaccine research was evident in the 1967 report of the Special Virus-Leukemia Program.** Projects were initiated to correlate cancer deaths of children and veterans with vaccines they may have received (as compared to "matched control groups"). One project recommended that a massive database be constructed and maintained by obtaining "death certificates for all U.S. children under 15 years of age who have died of cancer, 1960-1964" so that cancer deaths could correlated with names "of children believed to be at unusual risk of cancer; e.g., those given certain vaccines in the past." Were similar databases created for vaccine recipients who were deliberately predisposed to cancer through vaccines? [70]

- 66 The following chilling recommendation for future research was made in a World Health Organization publication from 1972: "An attempt should be made to ascertain whether viruses can in fact exert selective effects on immune function . . . or by affecting T cell function as opposed to B cell function. The possibility should also be looked into that the immune response to the virus may itself be impaired if the infecting virus damages more or less selectively the cells responding to the viral antigens." [emphasis added] This is exactly what HIV does. A. Allison, W. Beveridge, W. Cockburn, J. East, H. Goodman, H. Koprowski, P. Lambert, J. Van Loghem, P. Miescher, C. Mimms, A. Notkins, and G. Torrigiani, "Virus-Associated Immunopathology: Animal Models and Implications For Human Disease," Bulletin of the World Health Organization, vol. 47, no. 2, 1972, 259.
- 67 "Recent studies on virus-induced immunopathological reactions in domestic and experimental animals have led to the development of concepts and technical methods that may be useful in investigating certain viral diseases in man, including hepatitis." [emphasis added] Ibid., 258.
- 68 "In relation to the immune response, a number of useful experimental approaches can be visualized. One would be a study of the relationship of HL-A type to the immune response, both humoral and cellular, to well-defined bacterial and viral antigens during preventive vaccination." [emphasis added] Federation Proceedings, vol. 31, no. 3, May-June 1972, 1102.
- 69 The pre-AIDS WHO report recommended that an "international co-operative study of patients with immunological deficiency syndromes should be carried out." It also suggested that "[o]bservations on patients with immunological deficiency diseases should be as complete as possible, and it is desirable that they should enable valid comparisons to be made between patients studied in different institutions." [emphasis added] A. C. Allison, B. A. Askonas, B. Benacerraf, R. Ceppellini, R. A. Good, E. S. Lennox, H. O. McDevitt, R. S. Nezlin, and M. Seligmann, "Genetics of the Immune Response," World Health Organization Technical Report Series, no. 402, 34, 52.

Unfortunately, there is evidence to support the radical hypothesis that humanitarian vaccine programs were used to conduct inhumane cancer experiments. Promiscuous homosexuals were selectively targeted with an e**xperimental vaccine against hepatitis B** beginning in the late 1970s.[71] And the AIDS epidemic in promiscuous homosexuals began almost immediately after the first of these vaccine experiments.[72] It has been documented that recipients of this experimental hepatitis vaccine have been disproportionately afflicted with AIDS [73] and that immunosuppressed homosexuals are being targeted with numerous follow-up studies to monitor how cancer develops in immunosuppressed victims versus healthy populations.[74] Interestingly enough, the suspect experimental hepatitis B vaccine given to homosexuals just prior to the AIDS epidemic appears to have been a subset of a proposed global cancer vaccine experiment administered by the World Health Organization.[75] It was thought that hepatitis B was the cause of a form of cancer called hepatocellular carcinoma and that by immunizing people against hepatitis, immunity to this form of cancer might be obtained.[76] Hepatitis B vaccination trials were conducted as a means of developing vaccines for use in these international hepatitis/cancer vaccine trials. [77] (Hepatitis was also mentioned in WHO publications discussing the experimental merits of extending animal immunosuppressive techniques to human research.)

with Epstein Barr Virus Infection and Abnormalities of T Lymphocytes in Homosexual Men," Journal of Infectious Diseases, vol. 154, no. 4, October 1986, 556-561.

- 75 The hepatitis vaccine developed in these trials has been referred to by some observers as the first human cancer vaccine.
- 76 Researchers affiliated with the WHO noted in one publication, "The Meeting considered that there were good grounds to suppose that vaccination of children with hepatitis B vaccine at birth, or shortly thereafter, would confer long-term protection against the development of hepatocellular carcinoma." "Prevention of Liver Cancer," World Health Organization Technical Report Series 691 (Geneva: World Health Organization, 1983), 27.
- 77 These cancer vaccine trials have been declared a success. One paper reported, "Universal childhood vaccination against hepatitis B in Taiwan appears to have reduced the incidence of hepatocellular carcinoma." Mei-Hwei Chang, Chien-Jen Chen, Mei- Shu Lai, Hsu-Mei Hsu, Tzee-Chung Wu, Man-Shan Kong, Der-Cherng Liang, Wen-Yi Shau, and Ding-Shinn Chen, "Universal hepatitis B vaccination in Taiwan and the incidence of hepatocellular carcinoma in children." The New England Journal of Medicine, 26 June 1997, vol. 336, no. 26, 1855.

Given the admitted experimental nature of this cancer vaccine effort employing hepatitis vaccines, and, given the useful immunosuppression subsequently associated with one branch of it, it seems logical to ask: **Was this direct attempt at cancer vaccination using the hepatitis B vaccine augmented through the addition of immunosuppressive viruses, as was done in experimental animal populations?** [78] In other words, was there a covert cancer vaccine experiment within the overt cancer vaccine experiment associated with the hepatitis B program? Could this explain why immunosuppression in homosexual populations is proving so beneficial to cancer research? Such a procedure would represent the replication in human populations of a published experiment conducted in cats in which kittens were injected with a "vaccine" containing a mixture of immunosuppressive viruses and cancer agents. **Four-week-old specific-pathogen-free cats were immunized with a combined vaccine composed of killed feline leukemia virus and killed feline oncornavirus-associated cell membrane antigen-containing tumor cells.**

The authors further explained that the immunosuppressive leukemia virus present in the vaccine increased susceptibility to the oncornavirus cancer agents: "Thus, it appears that the protective immunity to feline oncornavirus disease was hindered rather than enhanced by inclusion of inactivated, purified FeLV as a vaccine component."[79] The Source of the International AIDS EpidemicIn addition to the AIDS outbreak in American homosexuals, there is evidence supporting the theory that the international HIV epidemic is also the result of a premeditated international "cancer vaccine" experiment implemented using existing vaccine programs associated with the World Health Organization.

While gay recipients of the hepatitis B/cancer vaccination program have been disproportionately stricken by the AIDS virus, according to a front page article in The Times of London, it is a segment of the recipients of the international smallpox vaccination administered by the WHO which have been disproportionately afflicted with AIDS in the developing world. Pearce Wright summarized in the Times: **The World Health Organization, which masterminded the 13 year campaign, is studying new scientific evidence suggesting that immunization with the smallpox vaccine Vaccinia awakened the unsuspected, dormant human immuno defence virus infection (HIV).[80]**

- 78 This process might allow long-term immunocompetence (through vaccine development) to be attained through short-term immunocompromise induced in a group of unfortunate human test subjects.
- 79 R. G. Olsen, et al.
- 80 Pearce Wright, "Smallpox vaccine 'triggered Aids virus,'" The Times of London, Monday, May 11, 1987.

The Times elaborated, "The smallpox vaccine theory would account for the position of each of the seven Central African states which top the league table of most affected countries; why Brazil became the most afflicted Latin American country; and how Haiti became the route for the spread of Aids to the U.S." ConclusionAIDS is providing a fantastic laboratory model on a large-scale—essentially duplicating research efforts conducted earlier on a smaller-scale to prove the immunodeficiency and virus model of cancer growth. For example, AIDS is providing answers that studies of immunosuppressed transplant patients and children with naturally occurring immune deficiency syndromes sought with respect to the viral nature of cancer and the breakdown of the immunological surveillance mechanism.[81] Indeed, the AIDS epidemic is providing a near ideal research vehicle for proving theories about cancer causation that were popular shortly before the epidemic broke out. In 1972 the Proceedings of the National Academy of Sciences published numerous articles speculating not only on the relationship between immunodeficiency [82] and viruses [83] in cancer formation, but specifically on the relationship between herpes viruses and cancers. [84] AIDS has made international headlines apparently showing that immunodeficiencies can be a major contributor to cancer due to viruses and that one of the main forms of cancer due to such immunodeficiencies—Kaposi's sarcoma—is due to a herpes virus.

Thus, in addition to providing evidence that the "breakdown of the immunological surveillance mechanism" can lead to cancer, AIDS is helping to identify the specific viruses involved in the resultant conversion to cancer. Consequently, the damage inflicted by HIV on the immunological surveillance mechanism will be useful in the development of cancer vaccines and, as is evident in animal experiments, the deadly AIDS virus itself may even be used in experimental human cancer vaccines.

- 81 One author summarized the situation in 1969: "Although further analyses are obviously required, the results suggest that children with immune deficiency syndromes or adults treated with immunosuppressives have a greatly increased risk of developing tumours, especially of the lymphoreticular system. Presumably this represents breakdown of the immunological surveillance mechanism, allowing proliferation of tumour cells that would otherwise be restrained by an immune response. Whether one or more viruses are involved cannot be stated on existing evidence." A. C. Allison, "Immune Responses to Virus-Induced Tumours,"Proc. Roy. Soc. Med, vol. 62, September 1969, 956-958.

In summary, it seems improbable that, by sheer chance, an unprecedented epidemic infection due to a type of virus invented by cancer researchers began benefiting cancer researchers almost immediately after they grew it in human cell cultures.

Given the immense benefits of the disease in combination with the history of human experimentation with cancer-causing viruses by the cancer research establishment, it seems more likely that AIDS is the result of human experimentation and not accident. This type of human experimentation would be directly in line with the type of cancer research perfected over decades of animal experiments with immunosuppressive viruses. It would also represent the culmination of a long series of experiments in humans in which immunosuppression was exploited as a mechanism to induce cancer by various means (including monkey sarcoma viruses) in the search for cancer vaccines. While this conclusion may seem extreme, the open medical literature contains many surprises that run contrary to what a blind faith in the medical research establishment would foster. One can only wonder what surprises the classified records of the CIA (which had an entire wing of a hospital to experiment in as part of its MKULTRA program [85]) and the National Cancer Institute hold. It is hoped that this brief study will provide insight into what areas should be further investigated. **A more detailed study, titled AIDS: THE "PERFECT" DISEASE, which examines not only the cancer research benefits of AIDS described above, but also the benefits to the national security establishment, is available at http://www.authorhouse.com/BookStore/.**

In this study, disturbing links between the national cancer research establishment and the biowarfare establishment are revealed as is the manner in which AIDS is helping to fulfill long-standing national security goals related to international population control in addition to fulfilling the goals of the cancer vaccine research establishment. Additionally, the sordid history of previously secret national and international testing programs of the U.S. government is reviewed. The proposed cancer experiment to explain the AIDS epidemic is placed within the context of this backdrop of unethical human experimentation under humanitarian pretexts. These unconscionable testing programs serve as a warning to those who would doubt that an experiment of the size and scope of that proposed to explain the AIDS epidemic could and would be carried out by the U.S. government under the auspices of cancer research.

- 85 "In another MKULTRA project, CIA secretly provided funding for the construction of a wing of Georgetown University Hospital in the 1950s so that it would have a locale to carry out clinicaltesting of its biological and chemical programs." Can you give someone cancer?

In December 2011, following his diagnosis of cancer, Venezuelan president Hugo Chavez speculated that American agents had induced the disease in him and possibly other South American leaders by injecting them with cancer cells. Despite the State Department's rejecting Chavez's claims, there nonetheless was no shortage of CIA conspiracy theorists who accepted the charge. The media too grabbed onto the story, not only because of the outlandish nature of the accusation but also because of the underlying question it raised: Can you give someone cancer? (Miami New Times, March 7, 2013; Slate, December 30, 2011).

While direct communication of cancer from one host to another has been documented, and transplanting cancer cells to another person in an effort to cause cancer is possible, it is extremely rare. It has been shown in organ transplant recipients, mother-to-fetal transmission, and a few rare events such as one reported in 2015 in the New England Journal of Medicine where cancer cells from a tapeworm invaded a man's body, spreading to his lymph nodes and his lungs. While ordinarily, the immune system would not allow this, in this case the man was severely immunosuppressed due to HIV/AIDS (Muehlenbachs et al. 2015). Other reported cases include transmission to a lab worker via a needle stick or a cut on the hand and one where a surgeon's laceration developed into a sarcoma. In these cases, however, while the cancer cells grew locally at the point of entry, they failed to progress beyond the site of entry (Welsh, 2011). It is well established that in normally functioning immune systems such cells (including cancer cells from another person) would be recognized as foreign and destroyed before they have a chance to wreak havoc (Janeway 1993). The reason we know this today is because decades ago researchers attempted to do just such a thing: injecting prison inmates and chronically ill hospitalized patients with live cancer cells. These experiments, carried out with little or no informed consent, took place in New York City, at one of the leading cancer research centers in the United States, despite the safeguards of the American healthcare and research ethics systems. While the scandal garnered headlines at the time (e.g., New York Times, January 26, 1964),it has since been largely forgotten, as have the people who unknowingly placed their bodies on the line to advance scientific knowledge, and it is a story that deserves retelling.

A brief history of ethics in medical research

While the Nuremberg Code of 1947 is generally regarded as the first document to set out ethical regulations for human experimentation based on informed consent, rules to protect the welfare of people subjected to medical experimentation were in fact in place long before this including in Germany. The first detailed regulation of non- therapeutic research in Wester medicine came from the Prussian minister for religious, educational, and medical affairs in 1900, following the public outcry at the work of Albert Neisser, the discoverer of the gonococcus (Vollmann and Winau, 1996).

In 1898, Neisser, who was attempting to develop a syphilis vaccine, published a study that outlined his results as well as his methods and study participants. Public debate in the press as well as among academicians ensued: Neisser had injected serum from patients with syphilis into patients who were admitted to hospital for other medical conditions, none of whom had suffered from syphilis at the time of the experiment. The controversy rested on two issues: the first was that most (but not all) of these patients were prostitutes, while the second was that none of them had been informed about the experiment or asked for their consent. After four of the prostitutes subsequently developed syphilis, it raised the issue of whether or not it was the injected cells that had in fact caused their illness, or as Neisser insisted, they had contracted it separately by pursuing their occupation (Toellner, 1981).

The majority of physicians aware of the case supported Neisser; the single exception was Albert Moll, a Berlin psychiatrist and highly regarded sexologist (Maehle 2012). While largely unrecognized in the medical literature, Moll is largely responsible for the formulation and elaboration of a theoretical conception of the contractual nature of the patient–doctor relationship and the development of informed consent, saying,

- *"I have observed with increasing surprise that some medics, obsessed by a kind of research mania, have ignored the areas of law and morality in a most problematic manner. For them, the freedom of research goes so far that it destroys any consideration for others. The borderline between human beings and animals is blurred for them. The unfortunate sick person who has entrusted herself to their treatment is shamefully betrayed by them, her trust is betrayed, and the human being is degraded to a guinea pig…." (Maehle 2009) Moll would go on to author one of the most comprehensive books on the subject of medical ethics, Arztliche Ethik (Medical Ethics)* (Katz, 1997).

Following increasing pressure from Moll as well as the press, the Neisser case came under investigation by the public prosecutor and the Royal Disciplinary Court. The court found that although Neisser was a well-known medical authority and may have been convinced that the trials were harmless, he should have sought the patients' consent; he was fined, and was lucky not to receive a more stringent punishment, because two years later, upon further investigation into the case, government lawyers stated that conducting non-therapeutic research on a subject without consent fulfilled the criteria for causing physical injury (battery) in criminal law (Vollmann and Winau, 1996).

Additional action was taken by the Prussian Landtag (parliament), which commissioned a detailed report from the Scientific Medical Office of Health, which was composed of leading German physicians, including Rudolf Virchow. The commission stated that a physician who recognized that injected serum might cause infection had no right to inject such a serum, but that in any case both informing the subject and obtaining the subject's consent were preconditions to experimentation. Informed consent became a mandatory precondition for any non-therapeutic research. Written documentation and clear responsibility of an institution's medical director for all human experimentation became legal doctrine, and all hospitals, clinics and medical directors were advised that any medical interventions other than for diagnosis, healing, and immunization were excluded under all circumstances if "the human subject was a minor or not competent for other reasons" or if the subject had not given "unambiguous consent" after a "proper explanation of the possible negative consequences of the intervention (Goss, 2017). Others took the somewhat extreme position that purely scientific experimentation on human subjects was unethical even if they gave voluntary consent and that self-experimentation should always precede experiments on patients, noting that the scientific validity of the experiment did not serve to mitigate these conditions (Vollmann and Winau, 1996).

Ironically, the other main early attempt to protect a human research subject's autonomy would occur in Hitler's Germany. In the German Reich's Rundschreiben (Reich's Circular) of 1931 the Reich government issued detailed guidelines that clearly distinguished between therapeutic ("new therapy") and nontherapeutic ("human experimentation") research and set out strict precautions for each. The rules for new therapy were explicit: "New therapy may be applied only if consent or proxy consent has been given in a clear and undebatable manner following appropriate information. New therapy may be introduced without consent only if it is urgently required and cannot be postponed because of the need to save life or prevent severe damage to health…." When it came to non-therapeutic research there was no wiggle room; the law clearly stated that "under no circumstances [is it] permissible without consent" (Sass, 1983).

While it's thus clear that the basic concept of informed consent was developed long before the Second World War and these guidelines remained in place throughout the reign of Adolf Hitler, they failed to stop the unethical experiments taking place in Nazi concentration camps (Caplan, 1991). It would be these experiments and the subsequent postwar trials of the physicians involved in them that would lead to the creation of the Nuremberg Code, a document among whose 10 principles the longest is on informed consent (Kumar 2013).

Informed consent

While it is widely believed that the Nuremberg Code has legal standing, in fact this document has no legal force behind it (Ghooi, 2011). In the US, legal informed consent owes its genesis to two landmark legal cases. Schloendorff vs. The Society of New York Hospital (1914) established the principle of patient consent and is considered one of the landmark legal cases in bioethics, while Salgo v. Leland Stanford etc. Bd. Trustees is responsible for adding 'informed' to the notion of 'consent.' A brief review of the Schloendorff case follows.

Mary E. Schloendorff agreed to have her physician examine her under anesthesia and to have her fibroid tumor biopsied. Prior to the procedure, Schloendorff specified that she was not consenting to the removal of the tumor; nonetheless, while she was anesthetized, the surgeon, believing the mass was malignant, removed the tumor. Schloendorff then sued the hospital. the course made its way to the New York Court of Appeals, which found that the operation to which the plaintiff did not consent constituted medical battery. Justice Benjamin Cardozo wrote that in the court's opinion:

- *"Every human being of adult years and sound mind has a right to determine what shall be done with his own body; and a surgeon who performs an operation without his patient's consent commits an assault for which he is liable in damages. This is true except in cases of emergency where the patient is unconscious and where it is necessary to operate before consent can be obtained."*

Schloendorff, however, received no monetary gain, since she had sued the hospital and not the surgeons; the court found that a non-profit hospital could not be held liable for the actions of its employees due to the legal principle of charitable immunity. Justice Cardozo's opinion is widely cited as the basis for the requirement to seek consent from patients before medical intervention is provided, upholding a patient's right to autonomous decision-making (Deverette, 1995).

The second case, the Salgo decision, marks the birth of the doctrine of informed consent as it is known today; the term "informed consent" was first used in this case. In 1957, Martin Salgo, age 55, consented to undergo a diagnostic procedure to locate the source of chronic pain in his leg; it was believed he was suffering from arteriosclerosis and that his aorta was also involved. He was advised to undergo diagnostic aortography. While under anesthesia, his aorta was injected with a contrast medium, and images were taken of the abdominal aorta. The next morning Salgo awoke to find that his lower limbs were paralyzed as a result of the contrast agent used in the procedure. Salgo subsequently sued his doctor, claiming that he was not informed about paralysis being a risk or possible complication of the contrast material. The court noted that a physician violates his duty to the patient if he withholds any facts necessary to form the basis of an intelligent consent by the patient to the proposed treatment. The court also noted that when discussing risk, the physician has discretion "consistent with the full disclosure of facts necessary to an informed consent." Salgo's doctor's defense argued that if patients were informed of all the possible complications, they would become frightened and would not consent to treatment. The court rejected this defense and ruled that simple consent was not sufficient for medical procedures; instead, sufficient disclosure of possible risks and complications, allowing "informed consent," was necessary for patients to make autonomous decisions, whether regarding a surgical procedure or a medical experiment (Osman, 2001).

While lacking legal standing, the Nuremberg Code did form an outline of what are now considered a physician's ethical duties, which were codified in a subsequent document created in 1964 in Helsinki, known as the Declaration of Helsinki, which addressed clinical research and humane treatment of study participants as well as issues such as informed consent. Like its predecessor, the Declaration of Helsinki has no legal standing or power (Shuster, 1997), but together they serve as models for regulators in most countries and inform the current US federal research regulations, which require not only the informed consent of the research subject (with proxy consent sometimes acceptable, such as for young children) but also prior peer review of research protocols by a committee (the institutional review board) (NIH Office for Protection from Research Risks 1991). With such protections in place, one might assume that US citizens were protected against unethical or life-threatening medical experimentation; unfortunately, as we will see, this was not the case.

Unclean hands

In jurisprudence, there is a doctrine known as "unclean hands"—if a defendant can prove that a plaintiff has "unclean hands," that is, has acted unethically,

then the plaintiff's complaint will be dismissed (Upcounsel.com n.d.). During the doctors trial in Nuremberg, defense attorneys argued that this doctrine applied, stating that the German experiments were essentially equivalent to those that had been and were still being performed in US penitentiaries (Weindling, 2001). This statement had more than a kernel of truth to it. While there had been relatively little medical research into human disease in the US during the 1930s, this would change dramatically in the 1940s, when for the first time there would be US government funding for such research (Baader et al. ,2005).

With the outbreak of WWII and the potential for American involvement in the conflict, there was a push for governmental involvement in and funding of academic research. In 1941, President Franklin D. Roosevelt authorized the establishment of the Office of Scientific Research and Development (OSRD). From 1941 through 1945, the OSRD's Committee on Medical Research would be responsible for developing and funding projects involving both human and animal subjects that studied, among other things, disease transmission and vaccine development. Susan Lederer, a professor of medical history and bioethics, notes that the human subjects involved in these studies were primarily "subjects of convenience"—individuals or populations conveniently and readily available to researchers, who included children in orphanages, patients in mental institutions, military personnel, and those incarcerated in penal institutions (Lederer 1995). This was an era in medicine when no one thought it necessary to ask permission to remove tissue samples from a patient or to ask permission to use such samples in medical experiments (Javitt, 2010). One such patient was an African-American women who, following delivery of her fifth child by age 30, developed intense vaginal bleeding and sought care at the Johns Hopkins Hospital, which, although segregated, was the only hospital in her hometown of Baltimore that would treat African-American patients. Hopkins was a charity hospital, as its benefactor Johns Hopkins, founder of the university and hospital, stipulated in his will (Johns Hopkins Medicine n.d.). Although the woman would expire on October 4, 1951, from what would be diagnosed as cervical cancer, she would nevertheless become immortal.

Henrietta and her HeLa cells

On October 4, 1951, Johns Hopkins–trained physician and director of the Tissue Culture Laboratory in the Hopkins Department of Surgery George Otto Gey appeared on national television to announce that a major breakthrough had occurred in cancer research (Skloot, 2000, Hanks and Bang, 1971). Gey had spent the majority of his career attempting to develop a method to grow cells outside the body. The problem was that cells cultured for laboratory studies survived for only a few days at most; but if he were able to keep cells alive "in culture," this would allow researchers to experiment on the cells in ways not possible in the body, thus increasing their knowledge of cell biology, especially that of cancer cells, and thus potentially leading to a cure (Gold, 1986:16).

For Gey to accomplish his goal, he would require a constant supply of cancerous tissue samples. Luckily for him, he had a readily available supply at the major medical institution where he worked; however, these sample were obtained without the patient's or their family's knowledge or permission (Lucey et al., 2009). One such sample would come from the 31-year-old African American women, Henrietta Lacks, who had died earlier on the day of Gay's televised announcement.

Gey had earlier observed that Lacks's cells were the first he had come across that could be divided multiple times without dying, and so on the day of her death, Gey had had Mary Kubicek, his lab assistant, take additional tissue samples while Lacks's body lay in the Johns Hopkins morgue (Gold, 1986:19–22). **Gey was able to start a cell line from Lacks' sample by isolating one specific cell and repeatedly dividing it, meaning that the same cell could then be used to conduct many experiments. They became known as HeLa cells, because Gey's standard method for labeling samples was to use the first two letters of the patient's first and last names (Gold, 1986:18).** These HeLa cells were in high demand by other researchers and were put into mass production. They were mailed to scientists around the globe, and the cell line would be used to make many important breakthroughs in biomedical research. **For example, by 1954, Jonas Salk was using HeLa cells in his research to develop the polio vaccine; the cells used in the vaccine were mass-produced in the first- ever cell production factory at the Tuskegee Institute, in Tuskegee, Alabama, where African-American scientists not only helped to grow the HeLa cells but also evaluated Salk's vaccine** (Brown and Henderson 1983). In a twist of irony, "Black scientists and technicians, many of them women, used cells from a black woman to help save the lives of millions of Americans, most of them white. And they did so on the same campus—and at the very same time—that state officials were conducting the infamous Tuskegee syphilis study" (Skloot, 2010:97). **What many people are unaware of, however, is that the HeLa cells were also participants in one of largest ethical breaches in cancer research** (Prison Legal News, March 15, 2008).

Chester Southam, MD

Chester Southam earned his BS and MS degrees from the University of Idaho and received his MD degree from Columbia University in 1947. Following a one-year internship at New York City's Presbyterian Hospital, he began training at Memorial Hospital for Cancer (the forerunner to Sloan-Kettering Cancer Hospital), also in New York. Over the next 4 years he would rise to become a research fellow and eventually director of the hospital's Division of Virology/Immunology. In 1951, he joined the faculty of Cornell's medical college, where he was eventually awarded a full professorship (New York Times, April 10, 2002).

From 1954 through 1966, Southam would concentrate his research on two main questions: whether cancer could be transmitted from person to person and whether certain virus antibodies had anti-neoplastic properties. To answer these questions, he would utilize society's most vulnerable citizens, including patients already diagnosed with cancer and undergoing gynecological surgery at Memorial Sloan-Kettering Cancer Hospital, incarcerated inmates, and frail, chronically ill nursing home patients (The BMJ Opinion, July 3, 2017). It was research that would raise ethical and moral issues that government regulators would later compare to those raised by Nazi experimentation (Arras 2008:75).

In 1953, Southam began what appear to have been his first human experiments to test his theory about virus antibodies with anti-neoplastic properties. To do this, he and various colleagues routinely inoculated cancer patients with dangerous viruses, including West Nile, Ilheus, and Bunyamwera viruses. A review of their published work makes the following statement:

- *"All patients were volunteers who had advanced neoplastic disease of an extent, type, and stage which precluded the possibility of therapeutic benefit from surgery, x-ray, or anti-neoplastic chemotherapeutic agents."*

The general physical condition of these patients varied extremely, from apparently well to terminal. There was a wide range of diagnostic types, including epidermoid carcinomas, adenocarcinomas, lymphomas and leukemia and other sarcomas. Blood for antibody studies was obtained immediately prior to each virus inoculation and usually at weekly intervals thereafter during the period of hospitalization, and as frequently as was practicable after patients had been discharged to their homes. (Southam and Moore, 1954)

Nowhere in the statement is there any indication of informed consent having been obtained from the patients; what is clear is the overreaching attempt to make it known that these patients were terminal, with the implication that they were going to die anyway. These early studies, not unlike Southam's later ones, would at times have serious consequences for the patients involved. An earlier paper authored by Southam noted some of the negative reactions suffered by some patients: "…caused mild encephalitis in 3 patients, and in the other patients caused no symptoms. Bunyamwera virus caused a very severe

encephalitis with residual mental damage in one patient" (Southam and Moore, 1951).

Sloan-Kettering and cancer immunology

Beginning in February 1954, Southam and his colleagues initiated their first human experiments in cancer immunology by injecting 14 previously diagnosed terminal cancer inpatients at the Memorial Hospital (which became Sloan-Kettering in 1948) with cancer cells. While hospital administrators stated that informed consent was given by these patients, it was highly questionable whether this consent met the standards for informed consent, both from a legal and an ethical standpoint. In explaining their consent policy, the hospital administration said this: "…these patients knew that they were receiving cancer cells, understood the reasons for the experimentation, and consented to it orally" (Langer, 1964). In a paper (Southam et al., 1957) reporting the results of this experiment the description of informed consent is somewhat vague: "…All recipients were volunteers who were aware of the general purposes of the study and the nature of the implanted materials and who were agreeable to subsequent biopsies." This loose interpterion of informed consent would continue throughout Southam's professional career.

While the results of the study showed that the transplanted cancer cells did grow in the cancer patients, producing small nodules that if excised did not return and if left alone would continue growing for 4–6 weeks and then spontaneously disappear, this wasn't the whole story. Two of the patients died before the anticipated regression; while they had been diagnosed as terminal at the time of implanting the cells, the fact that they died before regression had occurred meant that one could only assume that these patients' nodules were not excised. Nonetheless, their deaths were attributed to their existing cancer. In four patients, cancer regrowth occurred at the implantation site following removal of the nodule, and in one patient, the implanted cells were found to have metastasized to the axillary nodes. This patient had been suffering from uterine adenocarcinoma, which according to Southam could "readily be distinguished from the implanted cells," and at autopsy her adenocarcinoma was found to be confined to the abdomen and perineum, confirming that the metastasis that had occurred was a result of the implanted cells (Katz et al., 1972:11).

With this information, Southam believed he could argue that cancer patients lacked immunity to the cancer cell implants and were in fact suffering from an immune deficiency to cancer cells; however, to prove this theory, it would be necessary to demonstrate that the effects observed with cancer patients did not also occur in healthy individuals. Of course, being able to recruit subjects willingly volunteering to be injected with cancer cells was unlikely, and as a result, in situations like this, many researchers have used themselves as their subject; when asked if he ever considered using himself, Southam replied that "I would not have hesitated,…if it would have served a useful purpose. But, he continued, "to me it seemed like false heroism, like the old question whether the General should march behind or in front of his troops. I do not regard myself as indispensable— if I were not doing this work someone else would be—and I did not regard the experiment as dangerous. But, let's face it, there are relatively few skilled cancer researchers, and it seemed stupid to take even the little risk." While Southam would later say that this statement regarding self-injection was misquoted (Katz et al., 1972:49), it was a moot point, as he would find a ready supply of test subjects in the state of Ohio.

The prison volunteers

"CANCER RESEARCH VOLUNTEERS NEEDED" was the headline of a notice posted in the May 19, 1956, issue of the Ohio Penitentiary News, a weekly newspaper written and published by prisoners that was distributed throughout the US for annual subscription fee of $.50. The notice went on to explain that one of the ongoing issues in cancer research was why and how individuals without cancer (can) fight off cancer cells and prevent them from multiplying. But the explanation went further—it almost was made to sound diagnostic in nature, with the implication in the verbiage that any volunteer who had a previously undiagnosed or "hidden" cancer would be able to be diagnosed early and perhaps have a greater rate of survival. Below is such an example from the British Medical Journal.

For many years there has existed, one of many puzzling phenomena in the growth of cancer cells that still needs an answer; is still unsolved. Live cancer cells can be transferred from one individual to another. In the person who has cancer, the cancer cells will live and grow. In the person who has no cancer in his body, all of the transferred cells will die, eventually, after a short period of growth. It is this part of the problem that requires some further observation and study. Just how the normal individual who does not have cancer can kill off the transplanted 'Foreign' cancer cells, is the present important problem. So far, in past experiments, all attempts at growing one person's cancer cells in another individual, who does not have cancer, have ultimately failed. This is so, definitely, as far as we know now, that if transplanted cells do not grow, when injected into another person, it follows, that the injected person does not have cancer. If the cells do grow, it would indicate that the person injected probably does have a hidden or lurking cancerous growth somewhere in his body. (BMJ, 1956)

Researchers may have worried that they would have difficulty recruiting volunteers, or they may have honestly believed that the project was so benign that selection criteria were not needed—in any case, those criteria were almost non-existent. Inmates with history of TB, syphilis, osteomyelitis, cardiac disease, or hypertension would all be eligible to participate in the study. The researchers need not have worried: while the study called for 25 volunteers, the warden received applications from 130 of the 3,800 convicts in the penitentiary. While using prisoners for medical experimentation was common practice in the US at the time, most studies offered some form of financial incentive or a reduction in sentence, whereas in this case no incentives were offered. Most participants indicated that their reason for volunteering was that someone in their family had died of cancer, while others felt that this would be a way of redeeming themselves in the eyes of society: they had been "blanks all their lives" and were glad to have the opportunity to do something useful.

Each inmate was given a release to sign that indicated that the experiment was being carried out by the Division of Medical Research, College of Medicine, The Ohio State University, and the Sloan-Kettering Institute for Cancer Research, New York City. The release text ran as follows: "This study, as it has been explained to me, is intended to determine whether or not presumedly live cancer cells can be successfully transplanted, indirectly, from one individual to another. I have been told that the cancer cells will be transplanted to my body by means of direct needle injection under my skin…." The principal investigators were listed as "Doctors Charles A. Doan, Alice E. Moore, and Chester M. Southam, or their associates."

While Southam's prison inmate experiments raised ethical concerns, and some of his peers in the medical community believed that the research had violated the bioethical principles of informed consent, non-maleficence, and beneficence, the research would nonetheless continue for 12 years, eventually involving over 200 inmates. Sloan- Kettering received between $300,000 and $500,000 (between $3 million and $5 million in today's dollars) in federal funds from the National Cancer Institute and funding from the American Cancer Society (AP News, August 16, 1985). **With his reputation as a cancer expert, and emboldened by the backing of prestigious institutions such as Sloan-Kettering, the American Cancer Society, and the federal government, Southam would now find a new research study for his HeLa cells, which he had injected into the Ohio State Penitentiary inmates (Skloot, 2010:168).** This next project would not go as well for Southam, however.

The Jewish Hospital for Chronic Diseases

In 1963, with funding from the United States Department of Public Health and the American Cancer Society, Southam and colleague Emanuel Mandel began a study to test Southam's hypothesis that chronically ill patients who were not suffering from cancer would be able to reject implanted cancer cells as rapidly as patients who were not suffering from any disease and faster than those who were already afflicted with cancer. Southam hoped to be able to demonstrate that the apparent absence of immunity in the cancer patients was in fact attributable to cancer, and not simply to the general debility that accompanies any severe, chronic illness.

While his theory was proven correct and was recognized as one of the leading research experiments in the cancer field, there was a problem: how he had reached that conclusion. When it was revealed, the press had a field day, with magazines such as Good Housekeeping blaring vivid and critical headlines like "How doctors use patients as guinea pigs" (October, 1965:79). Science Magazine put it thus:

- "A number of circumstances made the case particularly newsworthy. The patients in question were 22 seriously ailing and debilitated inhabitants of a relatively obscure Brooklyn institution, The Jewish Chronic Disease Hospital(JCDH).

Nazi doctors?

In August 1963, a group of three physicians at JCDH, Avir Kagan, David Leichter, and Perry Fersko, expressed their concern about the methods used in Southam's research, and the issue was brought to the Hospital's Medical Grievance Committee for investigation however, instead of condemning these practices, the committee found no irregularities and instead commended the research. The three physicians resigned in protest and took their concerns to William Hyman, a hospital board member and an attorney. When Hyman asked the hospital for the relevant patient records, he was refused; then, believing that the hospital board of directors would side with him, he asked for their support, but the board instead endorsed the findings of the grievance committee. This forced Hyman to go through the courts and the press, with the latter quoting Hyman's description of Southam's experiments as "acts which belong more properly in Dachau" (Katz, 1972) and labeling the case "the hottest public debate on medical ethics since the Nuremberg trials of Nazi physicians" (Langer, 1964).

On July 7, 1964 in another twist of irony, the Appellate Division of the State Supreme Court ruled that a member of a hospital's board of directors did not have the right to inspect the medical records of patients, citing patient physician privacy protection (New York Times, July 7, 1964). This ruling would eventually be overturned by the New York State Court of Appeals on the grounds that "[t]he privacy of the patient could be protected, as the trial court had pointed out, by a simple order requiring that the patient's name be concealed" (Ratnoff 1966).

Following this ruling, Hyman pressed his case with New York Attorney General Louis L. Lefkowitz, who rejected Southam's assertion that oral consent had been given, saying that the patients "had not sufficient mental or physical ability to comprehend what was being told to them or what was being done to them," and that those patients with such capacity had been misled.

Lefkowitz' who was outraged, saying "every human being has an inalienable right to determine what shall be done with his own body," and sought to revoke Southam's license to practice medicine (Katz 1972).

Following a lengthy hearing, the New York State Board of Regents said that the "[z]eal for research must not be carried to the point where it violates the basic rights and immunities of a human person," and found both Southam and Mandel guilty of "fraud or deceit" and unprofessional conduct, voting to suspend their licenses. **However, this was later changed to a period of probation, Mand the disciplinary action had little if any effect on Southam's professional career, as he eventually published the results of his study from the JCDH in the Annals of the New York Academy of Sciences, where no mention was made of the lack of informed consent.**

In 1968, Southam was elected president of the American Association for Cancer Research. He died in 2002.

While the 1966 expose on the shortcomings of patient consent procedures penned by Harvard professor Henry Beecher (1966) in the New England Journal of Medicine cited the Southam case, it would take more than a decade until the post-Tuskegee outcry propelled the formation of the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research, the publication of the commission's Belmont Report, and, ultimately, the proliferation of institutional review boards to monitor experimentation.

Conclusion

One might wish to believe that unethical medical experimentation on human subjects is a thing of the past and that today's modern medicine still hides its collective head in shame for its ethical stumbles in the mid–20th century, unfortunately this is not the case. While stricter enforcement of rules and the introduction of IRBs have had a dramatic effect on unethical practice in the United States, this cannot be said of other some countries, where US-based companies and research organizations continue to exploit the absence of adequate laws to protect human subjects. While these issues are beyond the scope of this paper, it is important to understand that they do continue.

A 2008 report published by the Center for Research on Multinational Corporations revealed details of many such unethical trials, carried out in India, Nigeria, Russia, Argentina, and Nepal, among others. It revealed, for instance, the unrecorded deaths of 14 women in Uganda during a trial of the anti-HIV transmission drug Nevirapine, in a study sponsored by Boehringer Ingelheim and the US National Institutes of Health (NIH). It also revealed that eight patients in Hyderabad, in India, had died during a trial of the anti- clotting drug streptokinase—and that none of them were aware that they were part of an experiment (Somo.nl, n.d.) Even at Sloan-Kettering, almost 60 years after Southam's research, the institute would again make headlines when, in December 2018, a report in the New York Times disclosed that the hospital's chief medical officer, José Baselga, failed to disclose corporate ties in dozens of scientific articles he authored.

In fact, Baselga received millions of dollars in payments from companies involved in medical research, potentially compromising the work (New York Times, September 8,2018)

32 Similarly, it had been suspected that malaria created an immunosuppressive state in humans, which aided the growth of cancer allegedly caused by the Epstein-Barr virus. To test this hypothesis, researchers injected primates with combinations of a virus capable of inducing Burkitt's lymphoma and agents capable of inducing malaria. The 1967 report of the Special Virus-Leukemia Program noted that such studies were being conducted in monkeys: "A special project in progress involves induction of malaria in the recipient prior to inoculation with Burkitt virus." *Special Virus-Leukemia Program, Progress Report #4*, p. 21. Studies to determine whether these homologous cancer cells had a similar capacity for propagation in normal healthy human beings were undertaken at the Ohio State Penitentiary in collaboration with Charles Doan and Richard Brooks and with the cooperation of John Porterfield and R. W. Alvis, warden. From a large group of volunteers, 14 were chosen for the initial study. Methods were identical with the aforementioned ones, except that only tissue cultures were used, and all studies were done simultaneously in June 1956.

SUMMARY

Viruses have long been considered potential anticancer treatments. Wild-type viruses have been tested as anticancer agents in clinical trials since the 1960s. The possibility of viral oncolysis as an alternate cancer therapy was transformed by the emergence of modern genetic engineering. The herpes simplex virus (HSV) family offers particular advantages for use as a viral oncolytic. The engineered vectors that make up oncolytic HSVs (oHSVs) have demonstrated remarkable safety in clinical trials, with some evidence of efficacy. The past decade has seen a focus on increasing the efficacy of oncolytic vectors by adding exogenous transgenes to enhance tumor destruction. The current paper describes the various strategies for engineering HSV for increased cancer tissue specificity and efficacy. Presented are the rationale, preclinical data and clinical data where available. This is meant to illustrate a basic framework for the development of a novel therapy meant to exploit the viral life cycle for the killing of cancer.

HUMAN SUSCEPTIBILITY TO A SIMIAN TUMOR VIRUS

James T. Grace, Jr. and Edwin A. Mirand
Roswell Park Memorial Institute, New York State Department of Health, Buffalo, N.Y.

In 1957 Bearcroft and Jamieson noted an outbreak of subcutaneous tumors in a rhesus monkey colony in Yaba, Nigeria.[1] The initial tumor was detected on the face of a rhesus monkey which was housed in an open air pen. Subsequently, similar tumors appeared in 20 rhesus monkeys in the same colony. No tumors developed in African monkeys housed in the same area although one dog-faced baboon did develop a lesion. The tumors were composed of large pleomorphic cells, some of which contained cytoplasmic inclusion bodies, thus strengthening the suspicion that these lesions might be of viral etiology. Subsequently, Andrewes and co-workers demonstrated cell-free transmission of the tumors and identified the etiologic agent as a virus which morphologically resembled members of the pox virus group.[2] Niven *et al.* in a study of the histopathology of the tumors concluded that the cell of origin was probably the fibroblast or fibrocyte.[3] However, a detailed pathogenetic study by Sproul *et al.* indicated that the cell of origin was the tissue histiocyte and that the lesion might properly be termed a histiocytoma.[4,5] This point will be expanded in a later section of this paper.

Susceptibility to this virus appears to be limited to primates. Extensive studies involving inoculation of newborn and adult rabbits, guinea pigs, hamsters, rats, mice, and dogs by a variety of routes failed to produce proliferative lesions or evidence of virus replication.[6] The virus produced no lesions in the embryonated egg following inoculation of the chorioallantoic membrane or yolk sac. Subsequent inoculation of the egg passage material into monkeys revealed no evidence of virus. Similarly extensive attempts to propagate the virus in tissue culture were unsuccessful.[6,7] TABLE 1 shows the types of cell cultures employed and the results. In none of the cell culture systems employed was there evidence of cytopathogenicity or replication of virus.

TABLE 2 shows the susceptibility of various monkeys to the virus. Generally the rhesus and cynomolgus are most susceptible.[7] Six human volunteers with far advanced cancer were inoculated with virus obtained from monkey tumors. These tumor filtrates were cell-free, and as determined by animal, embryonated egg and tissue culture studies, were free of extraneous simian viruses. The humans developed lesions quite similar to those of the monkeys although the proliferative responses were not as marked and the lesions regressed earlier than those of monkeys. Viral recovery combined with serial passage and titration demonstrated replication of the virus in humans.[8,9]

A healthy young male laboratory worker accidentally punctured the web space of his hand with a contaminated needle. Within one week viral complement-fixing antibody appeared in his serum. The level rose progressively for three weeks and then remained at that level for four months at which time he developed a nodule at the site of needle puncture. The nodule grew rapidly for a period of seven days when it reached the diameter of about two centimeters. At this time the nodule was surgically excised. Histologically it

[HP005G][GDrive]

was similar to the typical monkey lesion and virus was readily recovered from it (FIGURE 1). The serum antibody level gradually diminished over the ensuing three-and-one-half months to a level where it was no longer detectable. He has now been observed for some two years following the excision of the lesion and has had no further difficulty.

Metzgar *et al.* developed a method for measuring complement-fixing antibodies against the virus.[8] The level of complement-fixing antibodies correlates well with the level of neutralizing capacity of the serum. Following inoculation of the virus into a susceptible host there is a prompt and sustained rise in complement-fixing antibody. The antibody level remains high during the period of active tumor growth. During this time the animals are resistant to reinfection with the virus. Following surgical removal or regression of the lesions there is a gradual diminution of antibody level until it becomes undetectable. This may require several months. Generally antibody levels developing in humans following infection are lower than those observed in susceptible monkeys. Immunity developing following tumor regression in the monkey is of relatively short duration. However, resistance to reinfection can be correlated with the level of serum antibody.[8]

When the virus is inoculated subcutaneously or intradermally, it produces a local tumor (FIGURE 2). Occasionally a remote tumor in the subcutaneous

tissue of susceptible monkeys may occur with this type of inoculation but this is uncommon. However, when the virus is inoculated intravenously into rhesus monkeys, the animals develop literally hundreds of small tumors in the muscle, subcutaneous tissues, heart, and lungs (FIGURES 3 & 4). Morpho-

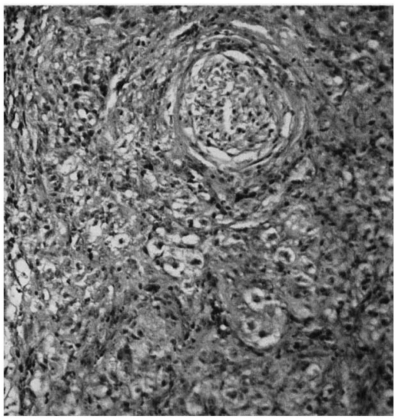

FIGURE 1. Histologic section of the lesion occurring in a laboratory worker accidentally infected with Yaba virus four months previously. This lesion shows many large cells containing cytoplasmic inclusion bodies in various stages of degeneration. However, mitotic activity was still apparent in some areas.

logically these lesions are similar to those produced by local inoculation. Death occasionally follows the intravenous route of infection.[5]

Histologically the tumors produced by the Yaba virus may be classified as histiocytomas.[4,5] In the pathogenetic studies of Sproul *et al.* it was noted that large numbers of histiocytes migrate to the area of virus inoculation in about 48 hours. By 72 hours the histiocytes began to show alterations. The alterations include enlargement of the nuclei and striking prominence of the nucleoli. They then assume elongate forms and by the fifth day mitosis is

[HP005I][GDrive]

very active. Occasional cytoplasmic inclusion bodies may be noted by the fifth day. By the seventh to ninth day there is active division of the spindle-shaped cells and they may assume definite patterns (*e.g.*, spiral forms) (FIGURE 5). The reticulum is well formed at this time. By the second week there are

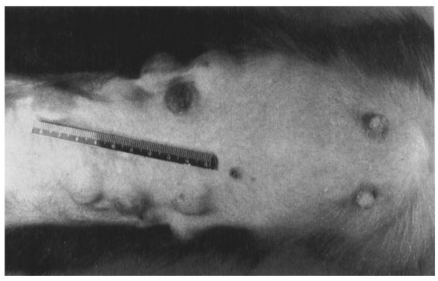

FIGURE 2. Tumors on abdomen of rhesus monkey three weeks following virus inoculation.

FIGURE 3. Rhesus monkey which received intravenous inoculation of virus.

[HP005J][GDrive]

many degenerating cells but at the same time other cells continue to divide actively. This general picture continues over the next four to six weeks during which time the number of degenerating cells gradually increase and the number of dividing cells gradually diminish. However, only at the very end stage

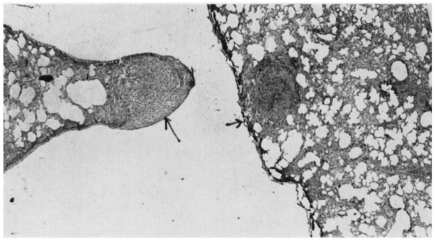

FIGURE 4. Tumor nodules in lung (as indicated by arrows) of rhesus monkey receiving intravenous inoculation of Yaba virus.

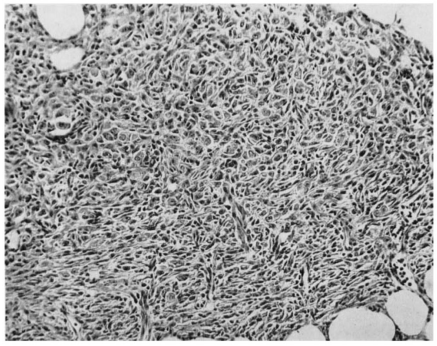

FIGURE 5. Nine-day-old tumor in rhesus monkey (H & E stain) showing spindle-shaped cells assuming a definite pattern.

[HP005K][GDrive]

of regression is there a noticeable host cellular reaction with infiltration of mononuclear cells. Regression occurs without central necrosis although the tumors may ulcerate on the surface. Once inclusion bodies appear in the cells, mitosis ceases and there is gradual cellular degeneration with increasing eosinophilic cytoplasmic masses, accumulation of cytoplasmic lipid, vacuolization and eventual cell dissolution. Regression of the tumor, however, cannot be related to the level of serum antibody and the histologic pattern of regression does not show the cellular response observed in homograft rejections. Thus the tumor regression may well be related to an *in vivo* cytopathic effect of the virus. In other words, the virus produces striking morphologic changes in the target cells and these in turn grow rapidly to produce tumors. However, the virulence of the virus is such that eventually it produces death of the tumor cells and resultant tumor regression. Virus released from the degenerating tumor cells is presumably bound by circulating antibody, thus preventing reinfection.

Summary

The Yaba virus is a simian agent which induces benign histiocytomas in susceptible monkeys and humans. Following infection there is a rise in viral complement-fixing antibody. However, growth and regression of the tumors cannot be correlated with serum antibody levels. Regression appears to be an individual cell phenomenon and may well represent an *in vivo* cytopathic effect of the virus. Subcutaneous or intradermal inoculation of virus produces only local tumors in the monkey and human. Intravenous inoculation of virus in the rhesus monkey produces widespread tumors in the subcutaneous tissues, skeletal muscle, lungs, and heart and occasionally results in death of the monkey.

1964 (Jan 26) - NYTimes : "Many Scientific Experts Condemn Ethics of Cancer Injection"

https://www.nytimes.com/1964/01/26/archives/many-scientific-experts-condemn-ethics-of-cancer-injection.html

1964-01-26-nytimes-many-scientific-experts-condemn-ethics-of-cancer-injection.pdf
January 26, 1964, Page 70

Medical research circles are buzzing over the disclosure last week of experiments in which persons were injected with living cancer cells without their knowledge.

Discussion centers less on the legality of the experiments than on the ethics and morality of them. Opinion is varied, but it leans heavily toward condemnation of the failure to inform the subjects of the research about exactly what was being done to them.

Varied reactions were expressed in interviews with several scientists active in clinical research and other authorities who have studied the ethics and morality of human experimentation.

Judgment ranged from the opinion that the experiments were “completely indefensible” on ethical grounds, and should not have been conducted at all, to the view that the experimenters were justified in the way they did their research. Both extremes were minority opinions.

The majority expressed the view that the studies were important and productive and should have been done, but that it was unethical not to tell the subjects that they were receiving living cancer cells instead of just “cells,” as the experimenters had described the tests to the patients.

The scientists who did this work, on the other hand, insisted that to tell many of the patients who took part in the research that they were receiving cancer cells would have been unethical.

The reason they gave for this was that a person who has cancer and will not admit it to himself—or has not been told of it—would be forced into the realization of his condition and that this would be psychologically - harmful to him.

The problem came to light last Monday when it was disclosed that 22 patients at Brooklyn's Jewish Chronic Disease Hospital had been injected with living cancer cells with their consent but without their knowing what the injections really consisted of.

It came out subsequently that nearly 300 other patients at the Sloan - Kettering Institute for Cancer Research and Memorial Hospital for Cancer and Allied Diseases had also participated in this work and that many of them had, similarly, not been told that the injections contained living cancer cells.

A third group, inmates of the Ohio State Penitentiary in Columbus, Ohio, volunteered for the tests, knowing that the injections consisted of cancer cells.

The research, under the direction of Dr. Chester M. Southam of Sloan - Kettering, has been going on for 10 years. It is aimed at studying the nature of the body's defense mechanisms—the immune reactions—in healthy persons, cancer patients and persons suffering from chronic diseases other than cancer.

The important outcome of the study so far is that a cancer patient's immune mechanisms are deficient. compared with those of the two other groups. The nature of the deficiency is now being studied.

Possible fruits of the work include the knowledge of how to help cancer patients fight their own tumors with immune reactions, how to manipulate the reaction so that grafts of foreign tissues would be practicable, and how to transfer immunity to disease from one person to another.

Thus, there has never been any - question of the potential value of the research.

Neither has there been much doubt about the safety of experiments. Sufficient experience with the injection of cancer cells in animals and in humans—many of them scientists, or volunteers who were told what they were getting—has shown that the risk of, say, causing cancer by the injections was considered to be very low.

Nor has there been any question of the competence and high standards of Dr. Southam, who is recognized as one of the world's leading authorities in this field.

Two supporters of the manner in which the work was done, in fact, declared that if the same procedure had been followed by almost any scientist other than Dr. Southam they would have thought it unethical, their regard for him was so high.

Rather, the question of ethics has been raised over the matter of whether the scientists usurped the rights of the subjects to make their own decisions about taking part in the experiments,

It w as pointed out by several critics of the work that these experiments were distinctly different from the sort of clinical research that is aimed at evaluating the efficacy of a new drug or vaccine or other therapeutic procedure.

Such studies, tney pointed out, are of direct potential benefit to the individual being tested. By contrast, the possibility of immediate benefit to the subject was not a consideration of the Sloan - Kettering project.

Moreover, the critics said, because a physical act on the person of the subject was involved in the research, a finite — though small — risk was involved. They asserted that this called for the complete disclosure to the subject of the nature of the injection.

In this respect, Dr. Southam said in an interview:

“It is not necessary to present [the subject] with what you feel are inconsequential data and [it is] unethical to ram down his throat information which is detrimental to his condition.”

Asked whether it would not be possible to use as subjects cancer sufferers who knew of their condition and so would not suffer from the revelation, Dr. Southam replied:

“You just don't know what the patient really knows or has accepted by himself.”

Dr. Southam was asked why the subjects at Jewish Chronic Disease Hospital who did not have cancer were similarly deprived of the knowledge that the injections contained living malignant cells.

He replied that the preparation of the patients and acquisition of their consent was left up to Jewish Hospital officials, who had decided simply to follow procedures that had been used for so long by the SloanKettering team.

The controversy gains significance because of the growing amount of human experimentation.

The ethics and morality of such experimentation have been discussed in medical journals in this country and abroad and by panels in medical schools.

An ethical code has been adopted by some institutions in this country and elsewhere: the Nuremberg Code for Permissible Human Experiments.

The first article of that code states:

“The voluntary consent of the human subject is absolutely essential. This means that the person involved should have legal capacity to give consent; should be so situated as to be able to exercise free choice, without the intervention of any element of force, fraud, deceit, duress, overreaching, or other ulterior form of constraint or coercion; and should have sufficient knowledge and comprehension of the elements of the subject matter involved as to enable him to make an understanding and enlightened decision. . . .”

State health officials are reported to be studying whether a stricter code of ethics for clinical research would be needed or justified.

The board now has no regulations about what kind of Consent, written or oral, is required from patients in scientific experiments.

Although many hospitals “do not go in for ‘paper,’ ” as one authority phrased the attitude toward written consent, some experts believe that this is the only ethical form of agreement and that vocal consent is not enough.

1964 (Dec 04) - NYTimes : "Mouse leukemia fought by a virus ..."

December 4, 1964, Page 47 / Source : [HN01K3][GDrive]

The discovery of a virus that appears capable of knocking out leukemia in mice without seriously harming the animals has been reported b/ a team of Long Island scientists.

The virus seems to he different from any other found in mice, a scientist said yesterday, and may represent a new category of these infectious agents.

Its unusual properties may account for the strange circumstances under which the virus was found by scientists at the Waldemar Research Foundation of Woodbury, L. I.

Those circumstances, in fact, may point the way to the development, of techniques for finding other viruses of similar characteristics — perhaps viruses that could be used safely against cancer In humans—the scientists said.

The report was presented yesterday to newsmen by Dr. Norman Molomut, director of Waldemar, at the New York Hilton Hotel. His colleagues, Dr. Morton Padnos and Dr. Leo Gross, were also present. Their findings will be published in Nature, the British scientific journal, in its issue of Dec. 5, and in a forthcoming number of The Journal of the National Cancer Institute.

The possibility of using viruses against cancer is not a new idea. The ability of viruses to kill cells and their preference for infecting only certain kinds led to speculation many years ago over whether viruses could be found that would attack cancer cells preferentially.

Work in 1920's Recalled

Work along this line began with the use of quite common viruses injected directly into animal cancers, and some measure of success was reported.

In the early nineteen - twenties for example, scientists at the Institut Pasteur in Paris reported making animal cancers shrink with injections of vaccinia, the virus in smallpox vaccine.

Early work on anticancer viruses in this country was done at the Sloan-Kettering Institute by [Dr. Alice E. Moore (born 1908)].

In a telephone interview yesterday, Dr. Moore recalled trying several types of. viruses against several kinds of animal cancers. She killed some of the tumors that way but left others unaffected. Moreover, she said, it was never determined how to predict which virus would work on which cancer.

In the early nineteen-fifties [Dr. Alice E. Moore (born 1908)] and Dr. Chester Southam began using viruses against tumors in human terminal cancer patients.

They found that the virus—Egypt 101, a strain of West Nile virus — sometimes was more destructive of cancer cells than of normal- ones or persisted! longer in tumors than in! healthy tissue.

The trouble was, Dr. Moore said, that the viruses did not "seem to be able to knock out" the very last cancer cell. Therefore, the tumors grew back when the viruses were depleted from the body. Additional injections of virus did not work because the first one acted as a vaccination, rendering the patient immune to further exposures to the virus.

New Findings Outlined

Nor would it have been practical to give an overwhelmingly large initial dose of the virushoping - in this way to kill all the cancer cells—because this would present the risk of death from viral infection.

In contrast, the virus that the Waldemar scientists have found seems to be ^effective against mouse leukemia —a blood cancer—at doses much lower than those that would cause overwhelming infection.

Moreover, all mice that received the virus are alive and free of cancer more than 150 days after receiving transplants of leukemia tissue, the scientists said. Normally, mice die of transplanted leukemias in a couple of weeks.

The virus was discovered in tissue cultures of a mouse tumor that would not grow when implanted into mice, Dr. Molomut said. The tumor was an Ehrlich ascites carcinoma, a cancer that grows in the abdominal fluid of mice.

In an effort to find out what was preventing the transplanted tumors from “taking” the scientists fractionated the cancer tissue and injected each fraction into mice, Dr. Molomut said.

Blood Stream Studied

Because their research focused primarily on tumor immunity, they, looked for reactions to the injections in the blood stream. One cell - free fraction of the tumor tissue culture caused a marked depletion in white blood cells, called lymphocytes, Dr. Molomut said.

Inasmuch as leukemia is characterized by an overabundance of white blood cells, he explained, that cell - free fraction was injected into mice that had received transplants of leukemia tissue. When growth of the leukemia tissue was inhibited, Dr. Molomut said, the fraction was studied further and found to contain a virus.

Dr. Molomut said he believed other viruses probably existed and should be sought in human material.

Meanwhile, the Waldemar virus is being more thoroughly studied by Dr. Molomut and his colleagues, Dr. John B. Nelson at the Rockefeller Institute and Dr. John Maloney of the National Institutes of Health in Bethesda, Md.

1968-1969 - President, American Association for Cancer Research

NOTICE TO MEMBERS OF THE AMERICAN ASSOCIATION FOR CANCER RESEARCH

Officers for 1968–1969

President: CHESTER M. SOUTHAM, Sloan-Kettering Institute for Cancer Research, New York, New York 10021
Vice President: ABRAHAM CANTAROW, National Cancer Institute, Bethesda, Maryland 20014
Secretary-Treasurer: HUGH J. CREECH, Institute for Cancer Research, Fox Chase, Philadelphia, Pennsylvania 19111

The annual dues of active members of the American Association for Cancer Research include a subscription to the journal CANCER RESEARCH. Payment of dues and changes of address of members of the Association should be sent promptly to Dr. Creech.

COMMUNICATIONS FOR THE ATTENTION OF THE EDITOR should be sent to Dr. Michael B. Shimkin, *Editor*, CANCER RESEARCH, Fels Research Institute, Temple University School of Medicine, Beury Bldg., 3701 N. Broad St., Philadelphia, Pennsylvania 19140.

NOTICE TO GENERAL SUBSCRIBERS

CANCER RESEARCH is published monthly, one volume per year, for Cancer Research, Inc. by Goodway Inc., 11401 Roosevelt Boulevard, Philadelphia, Pennsylvania 19154. Subscriptions include the Proceedings of the American Association for Cancer Research issued in March of each year. Subscriptions are payable in advance to the publisher of the journal, Goodway Inc., to which all business communications, remittances (in United States currency or its equivalent), and subscription orders should be sent. Subscription rates per annual volume in the United States, its possessions, and Canada, $25.00; in all other countries, $27.00. Single copies when available, $3.00.
Notify the publisher of changes of address 60 days in advance, giving both the old and new addresses. Copies undeliverable because of address changes will be destroyed.

BACK ISSUES OF THE JOURNAL

Copies of back stock of Part 1 of the journal CANCER RESEARCH for the two years preceding the current year may be ordered from Goodway Inc., address above. All earlier issues of Part 1 may be obtained from Walter J. Johnson, Inc., 111 Fifth Ave., New York, New York 10003. Copies of Part 2 (The Cancer Chemotherapy Screening Data Supplements) may be obtained from the Cancer Chemotherapy National Service Center, Bethesda, Maryland 20014.

Second-class postage paid at Philadelphia, Pennsylvania.

1961 (Nov 14) - Wife Anna L. Southam in the news...

Source : [HN01IW][GDrive] / For more, see **Dr. Anna Lenore Skow Southam (born 1915)**

Life's Just The Way She Likes: Busy Day At Home And Hospital

By JOAN W. KONNER
(Staff Writer)

The daily schedule of Anna L. Southam, M. D., of Demarest goes something like this:

7 A. M. — Husband, Chester Southam, M. D. brings her coffee and toast in bed.

8 A. M.—Makes household plans for the day; says good-bye to younger children, Lenore (Lenny), 15, a student at Northern Valley Regional High School and Arthur, 5, a kindergartener, (Larry, 19, her oldest child attends Wittenberg College, Springfield, Ohio).

8:30 A. M. — Reports to work at the Columbia Presbyterian Medical Center in New York, where she is associate attending obstetrician and gynecologist at the Presbyterian Hospital and associate professor of obstetrics and gynecology at Columbia University's College of Physicians and Surgeons.

8:30 A. M. to 6:30 P. M. — Working hours: laboratory research, takes charge of the gynecological clinic (infertility and endocrine clinic), teachers medical school classes, conferences with research fellows, office hours, operating room time, and writing.

6:30 P. M. — Leaves for home and hopes that patients do not go into labor at night;

7 P. M. — Time with family.

The woman who carries this giant-sized schedule works, in professional career, for and against the same goal — pregnancy.

Dr. Southam is an authority on the problems of infertility and birth control.

She is co-author of "Human Infertility", and numerous other papers and pamphlets on fertility. She is also a member of the medical advisory council of the Bergen County Planned Parenthood Center, 59 Essex Street, Hackensack.

"The interest in infertility and control of over-fertility go hand in hand," the tall, spare woman with midnight blue eyes and steel gray hair explained. "Actually both situations are two sides of the same coin."

A case in point is her current research product. She and a team of researchers are trying to establish whether antibodies, or factors which work against pregnancy, are present in women who cannot conceive. If such antibodies should ever be proved and isolated, they may someday be used to immunize other persons against pregnancy just as polio virus is now used to prevent polio.

Sitting in her book-lined office in the medical school building, Dr. Southam stated her approach to the problems of infertility.

"I'm antipsychological," she said in her soft-spoken, but direct manner. "I always try to find the reason for infertility.

"Naturally a woman gets frustrated when she cannot become pregnant. She's barred from her calling as an artist would be if he were prevented from painting. But frustration is not the cause.

"We can't always find the cause, and we recognize that the psychological factor is at times important, but it is not a bush to hide behind."

Also like two sides of the same coin, Dr. Southam's career has always gone hand in hand with her family life.

A native of Idaho, she met her husband in college at the University of Idaho. The two attended medical school together at Columbia University, College of Physicians and Surgeons.

She gave birth to her first child 7 days after graduating college, to her second, in her fourth year of medical school, and to her last, after office hours.

By design her daily hours coincide with her husband's. He does cancer research at the Memorial Cancer Research Center, New York.

When Dr. (Mrs.) Southam is home, she is not too tired to be both an indoor and outdoor girl.

"If it's ironing I have to do, I'm beat, but if it's gardening, I'm fine," she said with quiet humor.

She loves to cook (specialty of the house, beef stroganoff), but hates dishwashing. Often on weekends the beds go unmade.

The whole family loves the out-of-d rs. They have spent many vacations and weekends on camping and canoe trips.

"When you get up on the rocks, you know no one can get you on the telephone," she admitted.

Dr. Southam describes her life as hectic at times — she recalls the time one of her patients went into labor when she was cooking Thanksgiving dinner for 20 — but said she wouldn't have it any other way.

"I think my husband and I spend more time with our children than people who are home all the time.

"The children know when we're home, they're the important thing.

"Life is just the way I want it," she summed up, "except I'd like more hours in the day."

FOR AND AGAINST PREGNANCY: Dr. Anna Southam of Demarest works in her laboratory at the Columbia Presbyterian Medical Center in New York, to solve the mysteries of infertility and develop new methods of birth control. (The Record photograph.)

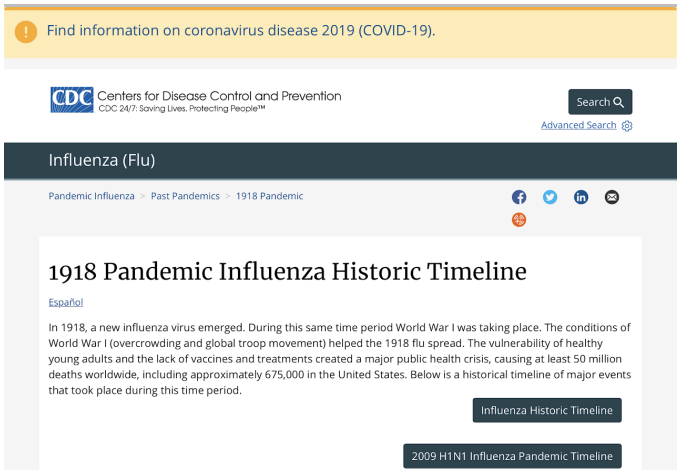
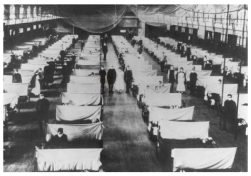
key events -

- **June 1917**
  - A draft is established to increase the number of soldiers; Army begins training recruits at 32 large camps, each housing 25,000 to 55,000 soldiers.
- Timelineicon
- **March 1918**
  - Outbreaks of flu-like illness are first detected in the United States.
  - More than 100 soldiers at Camp Funston in Fort Riley, Kansas become ill with flu. Within a week the number of flu cases quintuples.
  - Sporadic flu activity spreads unevenly through the United States, Europe, and possibly Asia over the next six months.
- Timelineicon
- **April 1918**
  - First mention of influenza appears in an April 5 weekly public health report. The report informs officials of 18 severe cases and three deaths in Haskell, Kansas.
- Timelineicon
- **May 1918**
  - By May, hundreds of thousands of soldiers travel across the Atlantic each month as they are deployed for World War I.



April 1917
- U.S. enters World War I with 378,000 in the armed services.

March 1918



- Outbreaks of flu-like illness are first detected in the United States.
- More than 100 soldiers at Camp Funston in Fort Riley, Kansas become ill with flu. Within a week the number of flu cases quintuples.
- Sporadic flu activity spreads unevenly through the United States, Europe, and possibly Asia over the next six months.

October 1918

- The 1918 flu pandemic virus kills an estimated 195,000 Americans during October alone.
- In fall of 1918 the United States experiences a severe shortages of professional nurses, because of the deployment of large numbers of nurses to military camps in the United States and abroad, and the failure to use trained African American nurses.
- Chicago chapter of the American Red Cross issues urgent call for volunteers to help nurse the ill.
- Philadelphia is hit hard with the pandemic flu viruses—more than 500 corpses await burial, some for more than a week. Cold-storage plants are used as temporary morgues, a manufacturer of trolley cars donates 200 packing crates for use as coffins.
- Chicago, along with many other cities across the United States, closes theaters, movie houses and night schools and prohibit public gatherings.
- San Francisco's Board of Health requires any person serving the public to wear masks and issues strong recommendation to all residents to wear masks in public.
- New York City reports a 40 percent decline in shipyard productivity due to flu illnesses in the midst of World War I.

December 1918
- Public health officials begin education programs and publicity about dangers of coughing and sneezing; careless disposal of "nasal discharges."
- Committee of the American Public Health Association encourages stores and factories to stagger opening and closing hours and for people to walk to work when possible instead of using public transport to prevent overcrowding.

January 1919

- A third wave of influenza occurs in the winter and spring of 1919, killing many more. Third wave subsides in the summer.
- In San Francisco, 1,800 flu cases and 101 deaths are reported in first five days of January.
- Many San Antonio citizens begin complaining that new flu cases aren't being reported, and that this is fueling another influenza surge.
- Seven-hundred and six cases of influenza and 67 deaths are reported in New York City, triggering fear of a recurrence of severe flu activity.
- Trustees of the Boston City Hospital ask mayor for a special appropriation of $3,000 to study the treatment of influenza.

June 1917
- A draft is established to increase the number of soldiers; Army begins training recruits at 32 large camps, each housing 25,000 to 55,000 soldiers.

April 1918
- First mention of influenza appears in an April 5 weekly public health report. The report informs officials of 18 severe cases and three deaths in Haskell, Kansas.

May 1918
- By May, hundreds of thousands of soldiers travel across the Atlantic each month as they are deployed for World War I.

September 1918

- The second wave of flu emerges at Camp Devens, a United States Army training camp just outside of Boston, and at a naval facility in Boston.
- Between September and November, a second wave of flu peaks in the United States. This second wave is highly fatal, and responsible for most of the deaths attributed to the pandemic.
- New York City's Board of Health adds flu to the list of reportable diseases, and requires all flu cases to be isolated at home or in a city hospital.
- By the end of September, more than 14,000 flu cases are reported at Camp Devens—equaling about one-quarter of the total camp, resulting in 757 deaths.

November 1918

- The end of World War I enables a resurgence of influenza as people celebrate Armistice Day and soldiers begin to demobilize.
- Salt Lake City officials place quarantine signs on front and rear doors of 2,000 homes where occupants have been struck with flu.
- By the end of World War I the U.S. military grew in size from 378,000 soldiers in April 1918 to 4.7 million soldiers.

February 1919
- Influenza appears to be nearly eradicated in New Orleans as number of reported cases drops.
- Illinois passes a bill to create a one-year course to become a "practical nurse," an effort to address the nursing shortage the pandemic had exposed.

April 1919
- At Versailles Peace Conference, while negotiating the end of World War I with other world leaders, U.S. President Woodrow Wilson collapses. Some historians speculate he was weak from influenza, which was still rampant in Paris.

Saved Wikipedia Article on "Spanish Flu" (July 3 2020)

See [HK0025][GDrive]

Disease : Influenza / Virus strain : Strains of A/H1N1 / Location : Worldwide / First outbreak : *Disputed*

Date : February 1918 – April 1920

Suspected cases‡ : 500 million (estimate)[2] / Deaths : 17–50+ million (estimate)

The **Spanish flu**, also known as the **1918 flu pandemic**, was an unusually deadly influenza pandemic caused by the H1N1 influenza A virus. Lasting February 1918 to April 1920, it infected 500 million people–about a third of the world's population at the time–in four successive waves. The death toll may have been anything from 17 million to 50 million, and possibly as high as 100 million, making it one of the deadliest pandemics in human history.[3]

The first observations of illness and mortality were documented in the United States (in Fort Riley, Haskell County, Kansas as well as in New York City), France (Brest), Germany and the United Kingdom. To maintain morale, World War I censors minimized these early reports. Newspapers were free to report the epidemic's effects in neutral Spain, such as the grave illness of King Alfonso XIII, and these stories created a false impression of Spain as especially hard hit. This gave rise to the name "Spanish" flu. Historical and epidemiological data are inadequate to identify with certainty the pandemic's geographic origin, with varying views as to its location.

Most influenza outbreaks disproportionately kill the very young and the very old, with a higher survival rate for those in between, but the Spanish flu pandemic resulted in a higher than expected mortality rate for young adults.[4] Scientists offer several possible explanations for the high mortality rate of the 1918 influenza pandemic. Some analyses have shown the virus to be particularly deadly because it triggers a cytokine storm, which ravages the stronger immune system of young adults.[5] In contrast, a 2007 analysis of medical journals from the period of the pandemic found that the viral infection was no more aggressive than previous influenza strains.[6][7] Instead, malnourishment, overcrowded medical camps and hospitals, and poor hygiene, all exacerbated by the recent war, promoted bacterial superinfection. This superinfection killed most of the victims, typically after a somewhat prolonged death bed.[8][9]

The 1918 Spanish flu was the first of two pandemics caused by H1N1 influenza A virus; the second was the 2009 swine flu pandemic.[10]

name stems from the pandemic's spread to Spain from France in November 1918.[11][12] Spain was not involved in the war, having remained neutral, and had not imposed wartime censorship.[13][14] Newspapers were therefore free to report the epidemic's effects, such as the grave illness of King Alfonso XIII, and these widely-spread stories created a false impression of Spain as especially hard hit.[15]

Alternative names were also used at the time of the pandemic. Similar to the name of Spanish flu, many of these also alluded to the purported origins of the disease. In Senegal it was named 'the Brazilian flu', and in Brazil 'the German flu', while in Poland it was known as 'the Bolshevik disease'.[16] In Spain itself, the nickname for the flu, the "Naples Soldier", was adopted from a 1916 operetta, *The Song of Forgetting* (*La canción del olvido*) after one of the librettists quipped that the play's most popular musical number, *Naples Soldier*, was as catchy as the flu.[17]

Nearly a century after the Spanish flu struck in 1918–1920, the World Health Organization (WHO) called on scientists, national authorities and the media to follow best practices in naming new human infectious diseases to minimize unnecessary negative effects on nations, economies and people - this includes a recommendation to no longer name diseases after places.[18][19] More modern terms for this virus include the "1918 influenza pandemic," the "1918 flu pandemic," or variations of these.[20][21][22]

History - Timeline

First wave of early 1918

The pandemic is conventionally marked as having begun on 4 March 1918, with the recording of the case of Albert Gitchell, an army cook at Camp Funston in Kansas, United States, despite there likely having been cases before him.[23] The disease had been observed in Haskell County in January 1918, prompting local doctor Loring Miner to warn the US Public Health Service's academic journal.[24] Within days, 522 men at the camp had reported sick.[25] By 11 March 1918, the virus had reached Queens, New York.[26] Failure to take preventive measures in March/April was later criticised.[27]

As the US had entered World War I, the disease quickly spread from Camp Funston, a major training ground for troops of the American Expeditionary Forces, to other US Army camps and Europe, becoming an epidemic in the Midwest, East Coast, and French ports by April 1918, and reaching the Western Front by the middle of the month.[23] It then quickly spread to the rest of France, Great Britain, Italy, and Spain, and in May reached Wrocław and Odessa.[23] After the signing of the Treaty of Brest-Litovsk, Germany started releasing Russian prisoners of war who then brought the disease to their country.[28] It reached North Africa, India, and Japan in May, and soon after had likely gone around the world as there had been recorded cases in Southeast Asia in April.[29] In June an outbreak was reported in China.[30] After reaching Australia in July, the wave started to recede.[29]

The first wave of the flu lasted from the first quarter of 1918, and was relatively mild.[31] Mortality rates were not appreciably above normal;[32] in the United States ~75,000 flu-related deaths were reported in the first six months of 1918, compared to ~63,000 deaths during the same time period in 1915.[33] In Madrid, Spain, fewer than 1,000 people died from influenza between May and June 1918.[34] There were no reported quarantines during the first quarter of 1918. However, the first wave caused a significant disruption in the military operations of World War I, with three-quarters of French troops, half the British forces, and over 900,000 German soldiers sick.[35]

Seattle police wearing masks in December 1918

Deadly second wave of late 1918

The second wave began in the second half of August, probably spreading to Boston and Freetown, Sierra Leone by ships from Brest, where it had likely arrived with American troops or French recruits for naval training.[35] From the Boston Navy Yard and Camp Devens (later renamed Fort Devens), about 30 miles west of Boston, other U.S. military sites were soon afflicted, as were troops being transported to Europe.[36] Helped by troop movements, it spread over the next two months to all of North America, and then to Central and South America, also reaching Brazil and the Caribbean on ships.[37] From Freetown, the pandemic continued to spread through West Africa along the coast, rivers, and the colonial railways, and from railheads to more remote communities, while South Africa received it in September on ships bringing back members of the South African Native Labour Corps returning from France.[37] From there it spread around Southern Africa and beyond the Zambezi, reaching Ethiopia in November.[38]

From Europe the second wave swept through Russia in a southwest-northeast diagonal front, as well as being brought to Arkhangelsk by the North Russia intervention, and then spread throughout Asia following the Russian Civil War and the Trans-Siberian railway, reaching Iran (where it spread through the holy city of Mashhad), and then later India in September, as well as China and Japan in October.[39] The celebrations of the Armistice of 11 November 1918 also caused outbreaks in Lima and Nairobi, but by December the wave was mostly over.[40]

American Expeditionary Force victims of the Spanish flu at U.S. Army Camp Hospital no. 45 in Aix-les-Bains, France, in 1918

The second wave of the 1918 pandemic was much more deadly than the first. The first wave had resembled typical flu epidemics; those most at risk were the sick and elderly, while younger, healthier people recovered easily. October 1918 was the month with the highest fatality rate of the whole pandemic.[41]

Third wave of 1919

In January 1919 a third wave of the Spanish Flu hit Australia, where it killed 12,000 following the lifting of a maritime quarantine, and then spread quickly through Europe and the United States, where it lingered through the Spring and until June 1919.[42][43][44][40] It primarily affected Spain, Serbia, Mexico and Great Britain, resulting in hundreds of thousands of deaths.[45] It was less severe than the second wave but still much more deadly than the initial first wave. In the United States, isolated outbreaks occurred in some cities including Los Angeles,[46] New York City,[47] Memphis, Nashville, San Francisco and St. Louis.[48] Overall American mortality rates were in the tens of thousands during the first six months of 1919.[49]

Fourth wave of 1920

In spring 1920 a very minor fourth wave occurred in isolated areas including New York City,[47] the United Kingdom, Austria, Scandinavia, and some South American islands.[50] Peru experienced a late wave in early 1920, and Japan had one from late 1919 to 1920, with the last cases in March.[51]

American Red Cross nurses tend to flu patients in temporary wards set up inside Oakland Municipal Auditorium, 1918.

History - Potential origins

Despite its name, historical and epidemiological data cannot identify the geographic origin of the Spanish flu.[2] However, several theories have been proposed.

United States

The first confirmed cases originated in the United States. Historian Alfred W. Crosby stated in 2003 that the flu originated in Kansas,[52] and popular author John M. Barry described a January 1918 outbreak in Haskell County, Kansas, as the point of origin in his 2004 article.[5]

A 2018 study of tissue slides and medical reports led by evolutionary biology professor Michael Worobey found evidence against the disease originating from Kansas, as those cases were milder and had fewer deaths compared to the infections in New York City in the same time period. The study did find evidence through phylogenetic analyses that the virus likely had a North American origin, though it was not conclusive. In addition, the haemagglutinin glycoproteins of the virus suggest that it originated long before 1918, and other studies suggest that the reassortment of the H1N1 virus likely occurred in or around 1915.[53]

Europe

The major UK troop staging and hospital camp in Étaples in France has been theorized by virologist John Oxford as being at the center of the Spanish flu.[54] His study found that in late 1916 the Étaples camp was hit by the onset of a new disease with high mortality that caused symptoms similar to the flu.[55][54] According to Oxford, a similar outbreak occurred in March 1917 at army barracks in Aldershot,[56] and military pathologists later recognized these early outbreaks as the same disease as the 1918 flu.[57][54] The overcrowded camp and hospital was an ideal environment for the spread of a respiratory virus. The hospital treated thousands of victims of poison gas attacks, and other casualties of war, and 100,000 soldiers passed through the camp every day. It also was home to a piggery, and poultry was regularly brought in from surrounding villages to feed the camp. Oxford and his team postulated that a precursor virus, harbored in birds, mutated and then migrated to pigs kept near the front.[56][57]

A report published in 2016 in the Journal of the Chinese Medical Association found evidence that the 1918 virus had been circulating in the European armies for months and possibly years before the 1918 pandemic.[58] Political scientist Andrew Price-Smith published data from the Austrian archives suggesting the influenza began in Austria in early 1917.[59]

China

In 1993, Claude Hannoun, the leading expert on the 1918 flu at the Pasteur Institute, asserted the precursor virus was likely to have come from China and then mutated in the United States near Boston and from there spread to Brest, France, Europe's battlefields, the rest of Europe, and the rest of the world, with Allied soldiers and sailors as the main disseminators.[60] Hannoun considered several alternative hypotheses of origin, such as Spain, Kansas, and Brest, as being possible, but not likely.[60] In 2014, historian Mark Humphries argued that the mobilization of 96,000 Chinese laborers to work behind the British and French lines might have been the source of the pandemic. Humphries, of the Memorial University of Newfoundland in St. John's, based his conclusions on newly unearthed records. He found archival evidence that a respiratory illness that struck northern China (where the laborers came from) in November 1917 was identified a year later by Chinese health officials as identical to the Spanish flu.[61][62] However, no tissue samples have survived for modern comparison.[63] Nevertheless, there were some reports of respiratory illness on parts of the path the laborers took to get to Europe, which also passed through North America.[63]

One of the few regions of the world seemingly less affected by the 1918 flu pandemic was China, where several studies have documented a comparatively mild flu season in 1918.[64][65][66] (Although this is disputed due to lack of data during the Warlord Period, see Around the globe). This has led to speculation

that the 1918 flu pandemic originated in China,[66][65][67][68] as the lower rates of flu mortality may be explained by the Chinese population's previously acquired immunity to the flu virus.[69][66][65]

A report published in 2016 in the Journal of the Chinese Medical Association found no evidence that the 1918 virus was imported to Europe via Chinese and Southeast Asian soldiers and workers and instead found evidence of its circulation in Europe before the pandemic.[58] The 2016 study suggested that the low flu mortality rate (an estimated one in a thousand) found among the Chinese and Southeast Asian workers in Europe meant that the deadly 1918 influenza pandemic could not have originated from those workers.[58] Further evidence against the disease being spread by Chinese workers was that workers entered Europe through other routes that did not result in a detectable spread, making them unlikely to have been the original hosts.[53]

Epidemiology and pathology - Transmission and mutation

As U.S. troops deployed en masse for the war effort in Europe, they carried the Spanish flu with them.

The basic reproduction number of the virus was between 2 and 3.[70] The close quarters and massive troop movements of World War I hastened the pandemic, and probably both increased transmission and augmented mutation. The war may also have reduced people's resistance to the virus. Some speculate the soldiers' immune systems were weakened by malnourishment, as well as the stresses of combat and chemical attacks, increasing their susceptibility.[71][72] A large factor in the worldwide occurrence of the flu was increased travel. Modern transportation systems made it easier for soldiers, sailors, and civilian travelers to spread the disease.[26] Another was lies and denial by governments, leaving the population ill-prepared to handle the outbreaks.[73]

The severity of the second wave has been attributed to the circumstances of the First World War.[74] In civilian life, natural selection favors a mild strain. Those who get very ill stay home, and those mildly ill continue with their lives, preferentially spreading the mild strain. In the trenches, natural selection was reversed. Soldiers with a mild strain stayed where they were, while the severely ill were sent on crowded trains to crowded field hospitals, spreading the deadlier virus. The second wave began, and the flu quickly spread around the world again. Consequently, during modern pandemics, health officials pay attention when the virus reaches places with social upheaval (looking for deadlier strains of the virus).[75] The fact that most of those who recovered from first-wave infections had become immune showed that it must have been the same strain of flu. This was most dramatically illustrated in Copenhagen, which escaped with a combined mortality rate of just 0.29% (0.02% in the first wave and 0.27% in the second wave) because of exposure to the less-lethal first wave.[76] For the rest of the population, the second wave was far more deadly; the most vulnerable people were those like the soldiers in the trenches – adults who were young and fit.[77]

After the lethal second wave struck in late 1918, new cases dropped abruptly – almost to nothing after the peak in the second wave.[78] In Philadelphia, for example, 4,597 people died in the week ending 16 October, but by 11 November, influenza had almost disappeared from the city. One explanation for the rapid decline in the lethality of the disease is that doctors became more effective in prevention and treatment of the pneumonia that developed after the victims had contracted the virus. However, John Barry stated in his 2004 book *The Great Influenza: The Epic Story of the Deadliest Plague In History* that researchers have found no evidence to support this position.[5] Another theory holds that the 1918 virus mutated extremely rapidly to a less lethal strain. This is a common occurrence with influenza viruses: there is a tendency for pathogenic viruses to become less lethal with time, as the hosts of more dangerous strains tend to die out.[5] Some fatal cases did continue into March 1919, killing one player in the 1919 Stanley Cup Finals.

Epidemiology and pathology - Signs and symptoms

US Army symptomology of the flu.

The majority of the infected experienced only the typical flu symptoms of sore throat, headache, and fever, especially during the first wave.[79] However, during the second wave the disease was much more serious, often complicated by bacterial pneumonia, which was often the cause of death.[79] This more serious type would cause *heliotrope cyanosis* to develop, whereby the skin would first develop two mahogany spots over the cheekbones which would then over a few hours spread to color the entire face blue, followed by black coloration first in the extremities and then further spreading to the limbs and the torso.[79] After this, death would follow within hours or days due to the lungs being filled with fluids.[79] Other signs and symptoms reported included spontaneous mouth and nosebleeds, miscarriages for pregnant women, a peculiar smell, teeth and hair falling, delirium, dizziness, insomnia, loss of hearing or smell, blurred vision, and impaired color vision.[79] One observer wrote, "One of the most striking of the complications was hemorrhage from mucous membranes, especially from the nose, stomach, and intestine. Bleeding from the ears and petechial hemorrhages in the skin also occurred".[80] The severity of the symptoms was believed to be caused by cytokine storms.[81]

The majority of deaths were from bacterial pneumonia,[82][83][84] a common secondary infection associated with influenza. This pneumonia was itself caused by common upper respiratory-tract bacteria, which were able to get into the lungs via the damaged bronchial tubes of the victims.[85] The virus also killed people directly by causing massive hemorrhages and edema in the lungs.[86]Modern analysis has shown the virus to be particularly deadly because it triggers a cytokine storm (overreaction of the body's immune system).[5] One group of researchers recovered the virus from the bodies of frozen victims and transfected animals with it. The animals suffered rapidly progressive respiratory failure and death through a cytokine storm. The strong immune reactions of young adults were postulated to have ravaged the body, whereas the weaker immune reactions of children and middle-aged adults resulted in fewer deaths among those groups.[78][87]

Epidemiology and pathology - Misdiagnosis

Because the virus that caused the disease was too small to be seen under a microscope at the time, there were problems with correctly diagnosing it.[88] The bacterium haemophilus influenzae was instead mistakenly thought to be the cause, as it was big enough to be seen and was present in many, though not all, patients.[88] During the deadly second wave there were also fears that it was in fact plague, dengue fever, or cholera.[89] Another common misdiagnosis was typhus, which was common in circumstances of social upheaval, and was therefore also affecting Russia in the aftermath of the October Revolution.[90] In Chile, the view of the country's elite was that the nation was in severe decline, and therefore the assumption of doctors was that the disease was typhus caused by poor hygiene, and not an infectious one, causing a mismanaged response which did not ban mass gatherings.[89]

Response - Public health management

Coromandel Hospital Board (New Zealand) advice to influenza sufferers (1918)

While systems for alerting public health authorities of infectious spread did exist in 1918, they did not generally include influenza, leading to a delayed response.[90] Nevertheless, actions were taken. Maritime quarantines were declared on islands such as Iceland, Australia, and American Samoa, saving many

lives.[90] Social distancing measures were introduced, for example closing schools, theatres, and places of worship, limiting public transportation, and banning mass gatherings.[91] Wearing face masks became common in some places, such as Japan, though there were debates over their efficacy.[91] There was also some resistance to their use, as exemplified by the Anti-Mask League of San Francisco. Vaccines were also developed, but as these were based on bacteria and not the actual virus, they could only help with secondary infections.[91] The actual enforcement of various restrictions varied.[92]

A later study found that measures such as banning mass gatherings and requiring the wearing of face masks could cut the death rate up to 50 percent, but this was dependent on them being imposed early in the outbreak and not being lifted prematurely.[93]

Response - Medical treatment

As there were no antiviral drugs to treat the virus, and no antibiotics to treat the secondary bacterial infections, doctors would rely on a random assortment of medicines with varying degrees of effectiveness, such as aspirin, quinine, arsenics, digitalis, strychnine, epsom salts, castor oil, and iodine.[94] Treatments of traditional medicine, such as bloodletting, ayurveda, and kampo were also applied.[95]

Response - Information dissemination

Due to World War I, many countries engaged in wartime censorship, and suppressed reporting of the pandemic.[96] For example, the Italian newspaper *Corriere della Sera* was prohibited from reporting daily death tolls.[97] The newspapers of the time were also generally paternalistic and worried about mass panic.[97] Misinformation would also spread along the disease. In Ireland there was a belief that noxious gases were rising from the mass graves of Flanders Fields and being "blown all over the world by winds".[98] There were also beliefs that the Germans were behind it, for example by poisoning the aspirin manufactured by Bayer, or by releasing poison gas from U-boats.[99]

Mortality

Around the globe

Difference between the influenza mortality age-distributions of the 1918 epidemic and normal epidemics – deaths per 100,000 persons in each age group, United States, for the interpandemic years 1911–1917 (dashed line) and the pandemic year 1918 (solid line)[100]

Three pandemic waves: weekly combined influenza and pneumonia mortality, United Kingdom, 1918–1919[101]

The Spanish flu infected around 500 million people, about one-third of the world's population.[2] Estimates as to how many infected people died vary greatly, but the flu is regardless considered to be one of the deadliest pandemics in history.[102][103] An estimate from 1991 states that the virus killed between 25 and 39 million people.[81] A 2005 estimate put the death toll at 50 million (about 3% of the global population), and possibly as high as 100 million (more than 5%).[80][104] However, a reassessment in 2018 estimated the total to be about 17 million,[105] though this has been contested.[106] With a world population of 1.8 to 1.9 billion,[107] these estimates correspond to between 1 and 6 percent of the population.

The disease killed in many parts of the world. Some 12-17 million people died in India, about 5% of the population.[108] The death toll in India's British-ruled districts was 13.88 million.[109] Another estimate gives at least 12 million dead.[110] The decade between 1911 and 1921 was the only census period in which India's population fell, mostly due to devastation of the Spanish flu pandemic.[111][112]

In Finland, 20,000 died out of 210,000 infected.[113] In Sweden, 34,000 did.[114]

In Japan, 23 million people were affected, with at least 390,000 reported deaths.[115] In the Dutch East Indies (now Indonesia), 1.5 million were assumed to have died among 30 million inhabitants.[116] In Tahiti, 13% of the population died during one month. Similarly, in Western Samoa 22% of the population of 38,000 died within two months.[117]

In New Zealand, the flu killed an estimated 6,400 Pakeha and 2,500 indigenous Maori in six weeks, with Māori dying at eight times the rate of Pakeha.[118][119]

In the U.S., about 28% of the population of 105 million became infected, and 500,000 to 850,000 died (0.48 to 0.81 percent of the population).[120][121][122] Native American tribes were particularly hard hit. In the Four Corners area, there were 3,293 registered deaths among Native Americans.[123] Entire Inuit and Alaskan Native village communities died in Alaska.[124] In Canada, 50,000 died.[125]

In Brazil, 300,000 died, including president Rodrigues Alves.[126]

In Britain, as many as 250,000 died; in France, more than 400,000.[127]

In Ghana, the influenza epidemic killed at least 100,000 people.[128] Tafari Makonnen (the future Haile Selassie, Emperor of Ethiopia) was one of the first Ethiopians who contracted influenza but survived.[129][130] Many of his subjects did not; estimates for fatalities in the capital city, Addis Ababa, range from 5,000 to 10,000, or higher.[131]

The death toll in Russia has been estimated at 450,000, though the epidemiologists who suggested this number called it a "shot in the dark".[81] If it is correct, Russia lost roughly 0.4% of its population, meaning it suffered the lowest influenza-related mortality in Europe. Another study considers this number unlikely, given that the country was in the grip of a civil war, and the infrastructure of daily life had broken down; the study suggests that Russia's death toll was closer to 2%, or 2.7 million people.[132]

Devastated communities

A chart of deaths from all causes in major cities, showing a peak in October and November 1918

Even in areas where mortality was low, so many adults were incapacitated that much of everyday life was hampered. Some communities closed all stores or required customers to leave orders outside. There were reports that healthcare workers could not tend the sick nor the gravediggers bury the dead because they too were ill. Mass graves were dug by steam shovel and bodies buried without coffins in many places.[133]

Bristol Bay, a region of Alaska populated by indigenous people, suffered a death rate of 40 percent of the total population, with some villages entirely disappearing.[134]

Several Pacific island territories were hit particularly hard. The pandemic reached them from New Zealand, which was too slow to implement measures to prevent ships, such as the SS *Talune*, carrying the flu from leaving its ports. From New Zealand, the flu reached Tonga (killing 8% of the population), Nauru (16%), and Fiji (5%, 9,000 people).[135] Worst affected was Western Samoa, formerly German Samoa, which had been occupied by New Zealand in 1914. 90%

of the population was infected; 30% of adult men, 22% of adult women, and 10% of children died. By contrast, Governor John Martin Poyer prevented the flu from reaching neighboring American Samoa by imposing a blockade.[135] The disease spread fastest through the higher social classes among the indigenous peoples, because of the custom of gathering oral tradition from chiefs on their deathbeds; many community elders were infected through this process.[136]

In Iran, the mortality was very high: according to an estimate, between 902,400 and 2,431,000, or 8% to 22% of the total population died.[137] The country was going through the Persian famine of 1917–1919 concurrently.

In Ireland, during the worst 12 months, the Spanish flu accounted for one-third of all deaths.[138][139]

In South Africa it is estimated that about 300,000 people amounting to 6% of the population died within six weeks. Government actions in the early stages of the virus' arrival in the country in September 1918 are believed to have unintentionally accelerated its spread throughout the country.[140] Almost a quarter of the working population of Kimberley, consisting of workers in the diamond mines, died.[141] In British Somaliland, one official estimated that 7% of the native population died.[142] This huge death toll resulted from an extremely high infection rate of up to 50% and the extreme severity of the symptoms, suspected to be caused by cytokine storms.[81]

Less-affected areas

In the Pacific, American Samoa[143] and the French colony of New Caledonia[144] also succeeded in preventing even a single death from influenza through effective quarantines. Australia also managed to avoid the first two waves with a quarantine.[90] Iceland protected a third of its population from exposure by blocking the main road of the island.[90] By the end of the pandemic, the isolated island of Marajó, in Brazil's Amazon River Delta had not reported an outbreak.[145] Saint Helena also reported no deaths.[146]

1919 Tokyo, Japan

Estimates for the death toll in China have varied widely,[147][81] a range which reflects the lack of centralized collection of health data at the time due to the Warlord period. China may have experienced a relatively mild flu season in 1918 compared to other areas of the world.[65][66][69][148] However, some reports from its interior suggest that mortality rates from influenza were perhaps higher in at least a few locations in China in 1918.[132] At the very least, there is little evidence that China as a whole was seriously affected by the flu compared to other countries in the world.[149]

The first estimate of the Chinese death toll was made in 1991 by Patterson and Pyle, which estimated China had a death toll of between 5 and 9 million. However, this 1991 study was subsequently criticized by later studies due to flawed methodology, and newer studies have published estimates of a far lower mortality rate in China.[64][150][65] For instance, Iijima in 1998 estimates the death toll in China to be between 1 and 1.28 million based on data available from Chinese port cities.[151] The lower estimates of the Chinese death toll are based on the low mortality rates that were found in Chinese port cities (for example, Hong Kong) and on the assumption that poor communications prevented the flu from penetrating the interior of China.[147] However, some contemporary newspaper and post office reports, as well as reports from missionary doctors, suggest that the flu did penetrate the Chinese interior and that influenza was severe in at least some locations in the countryside of China.[132] Although medical records from China's interior are lacking, there was extensive medical data recorded in Chinese port cities, such as then British-controlled Hong Kong, Canton, Peking, Harbin and Shanghai. This data was collected by the Chinese Maritime Customs Service, which was largely staffed by non-Chinese foreigners, such as the British, French, and other European colonial officials in China.[152] As a whole, accurate data from China's port cities show astonishingly low mortality rates compared to other cities in Asia.[152] For example, the British authorities at Hong Kong and Canton reported a mortality rate from influenza at a rate of 0.25% and 0.32%, much lower than the reported mortality rate of other cities in Asia, such as Calcutta or Bombay, where influenza was much more devastating.[152][65] Similarly, in the city of Shanghai – which had a population of over 2 million in 1918 – there were only 266 recorded deaths from influenza among the Chinese population in 1918.[152] If extrapolated from the extensive data recorded from Chinese cities, the suggested mortality rate from influenza in China as a whole in 1918 was likely lower than 1% – much lower than the world average (which was around 3–5%).[152] In contrast, Japan and Taiwan had reported a mortality rate from influenza around 0.45% and 0.69% respectively, higher than the mortality rate collected from data in Chinese port cities, such as Hong Kong (0.25%), Canton (0.32%), and Shanghai.[152]

Patterns of fatality

A nurse wears a cloth mask while treating a patient in Washington, DC

The pandemic mostly killed young adults. In 1918–1919, 99% of pandemic influenza deaths in the U.S. occurred in people under 65, and nearly half of deaths were in young adults 20 to 40 years old. In 1920, the mortality rate among people under 65 had decreased sixfold to half the mortality rate of people over 65, but 92% of deaths still occurred in people under 65.[153] This is unusual, since influenza is typically most deadly to weak individuals, such as infants under age two, adults over age 70, and the immunocompromised. In 1918, older adults may have had partial protection caused by exposure to the 1889–1890 flu pandemic, known as the "Russian flu".[154] According to historian John M. Barry, the most vulnerable of all – "those most likely, of the most likely", to die – were pregnant women. He reported that in thirteen studies of hospitalized women in the pandemic, the death rate ranged from 23% to 71%.[155] Of the pregnant women who survived childbirth, over one-quarter (26%) lost the child.[156]Another oddity was that the outbreak was widespread in the summer and autumn (in the Northern Hemisphere); influenza is usually worse in winter.[157]

There were also geographic patterns to the disease's fatality. Some parts of Asia had 30 times higher death rates than some parts of Europe, and generally Africa and Asia had higher rates, while Europe, North America, and Asia had lower ones.[158] There was also great variation within continents, with three times higher mortality in Hungary and Spain compared to Denmark, two to three times higher chance of death in Sub-Saharan Africa compared to North Africa, and possibly up to ten times higher rates between the extremes of Asia.[158] Cities were affected worse than rural areas.[158] There were also differences between cities, which might have reflected exposure to the milder first wave giving immunity, as well as the introduction of social distancing measures.[159]

Another major pattern was that of differences between social classes. In Oslo, death rates were inversely correlated with apartment size, as the poorer people living in smaller apartments died at a higher rate.[160] Social status was also reflected in the higher mortality among immigrant communities, with Italian Americans, a recently arrived group at the time, were nearly twice as likely to die compared to the average Americans.[158] These disparities reflected worse diets, crowded living conditions, and problems accessing healthcare.[158] Paradoxically however, African Americans were relatively spared by the pandemic.[158]

More men than women were killed by the flu, as they were more likely to go out and be exposed, while women would tend to stay at home.[159] For the same reason men also were more likely to have pre-existing tuberculosis, which severely worsened the chances of recovery.[159] However, in India the opposite was

true, potentially because Indian women were neglected with poorer nutrition, and were expected to care for the sick.[159]

A study conducted by He *et al*. (2011) used a mechanistic modeling approach to study the three waves of the 1918 influenza pandemic. They examined the factors that underlie variability in temporal patterns and their correlation to patterns of mortality and morbidity. Their analysis suggests that temporal variations in transmission rate provide the best explanation, and the variation in transmission required to generate these three waves is within biologically plausible values.[161] Another study by He *et al*. (2013) used a simple epidemic model incorporating three factors to infer the cause of the three waves of the 1918 influenza pandemic. These factors were school opening and closing, temperature changes throughout the outbreak, and human behavioral changes in response to the outbreak. Their modeling results showed that all three factors are important, but human behavioral responses showed the most significant effects.[162]

Impact

World War I

Academic Andrew Price-Smith has made the argument that the virus helped tip the balance of power in the latter days of the war towards the Allied cause. He provides data that the viral waves hit the Central Powers before the Allied powers and that both morbidity and mortality in Germany and Austria were considerably higher than in Britain and France.[59]

Economic

Alberta's provincial board of health poster

Many businesses in the entertainment and service industries suffered losses in revenue, while the healthcare industry reported profit gains.[163] Historian Nancy Bristow has argued that the pandemic, when combined with the increasing number of women attending college, contributed to the success of women in the field of nursing. This was due in part to the failure of medical doctors, who were predominantly men, to contain and prevent the illness. Nursing staff, who were mainly women, celebrated the success of their patient care and did not associate the spread of the disease with their work.[164]

A 2020 study found that US cities that implemented early and extensive non-medical measures (quarantine etc.) suffered no additional adverse economic effects due to implementing those measures,[165] when compared with cities that implemented measures late or not at all.[166]

Long-term effects

A 2006 study in the *Journal of Political Economy* found that "cohorts *in utero* during the pandemic displayed reduced educational attainment, increased rates of physical disability, lower income, lower socioeconomic status, and higher transfer payments received compared with other birth cohorts."[167] A 2018 study found that the pandemic reduced educational attainment in populations.[168] The flu has also been linked to the outbreak of encephalitis lethargica in the 1920s.[169]

Legacy

Despite the high morbidity and mortality rates that resulted from the epidemic, the Spanish flu began to fade from public awareness over the decades until the arrival of news about bird flu and other pandemics in the 1990s and 2000s.[170] This has led some historians to label the Spanish flu a "forgotten pandemic".[52]

1918 influenza epidemic burial site in Auckland, New Zealand

There are various theories of why the Spanish flu was "forgotten". The rapid pace of the pandemic, which, for example, killed most of its victims in the United States within less than nine months, resulted in limited media coverage. The general population was familiar with patterns of pandemic disease in the late 19th and early 20th centuries: typhoid, yellow fever, diphtheria and cholera all occurred near the same time. These outbreaks probably lessened the significance of the influenza pandemic for the public.[171] In some areas, the flu was not reported on, the only mention being that of advertisements for medicines claiming to cure it.[172]

Additionally, the outbreak coincided with the deaths and media focus on the First World War.[173] Another explanation involves the age group affected by the disease. The majority of fatalities, from both the war and the epidemic, were among young adults. The number of war-related deaths of young adults may have overshadowed the deaths caused by flu.[153]

When people read the obituaries, they saw the war or postwar deaths and the deaths from the influenza side by side. Particularly in Europe, where the war's toll was high, the flu may not have had a tremendous psychological impact or may have seemed an extension of the war's tragedies.[153] The duration of the pandemic and the war could have also played a role. The disease would usually only affect a particular area for a month before leaving[*citation needed*]. The war, however, had initially been expected to end quickly but lasted for four years by the time the pandemic struck.

In 2019, the first dedicated monument to the memory of the pandemic was unveiled in Wiesloch in Germany.[174]

- [...]

Comparison with other pandemics

This flu killed more people in 24 weeks than HIV/AIDS killed in 24 years.[78] However, it killed a much lower percentage of the world's population than the Black Death, which lasted for many more years.[175]**Notes**

1. ^ Not necessarily pandemic, but included for comparison purposes.

Research

Main article: Spanish flu research .. see next ..

An electron micrograph showing recreated 1918 influenza virions

The origin of the Spanish flu pandemic, and the relationship between the near-simultaneous outbreaks in humans and swine, have been controversial. One hypothesis is that the virus strain originated at Fort Riley, Kansas, in viruses in poultry and swine which the fort bred for food; the soldiers were then sent from Fort Riley around the world, where they spread the disease.[197] Similarities between a reconstruction of the virus and avian viruses, combined with the

human pandemic preceding the first reports of influenza in swine, led researchers to conclude the influenza virus jumped directly from birds to humans, and swine caught the disease from humans.[198][199] Others have disagreed,[200] and more recent research has suggested the strain may have originated in a nonhuman, mammalian species.[201] An estimated date for its appearance in mammalian hosts has been put at the period 1882–1913.[202] This ancestor virus diverged about 1913–1915 into two clades (or biological groups), which gave rise to the classical swine and human H1N1 influenza lineages. The last common ancestor of human strains dates to between February 1917 and April 1918. Because pigs are more readily infected with avian influenza viruses than are humans, they were suggested as the original recipients of the virus, passing the virus to humans sometime between 1913 and 1918.

At the Centers for Disease Control and Prevention, Terrence Tumpey examines a reconstructed version of the 1918 flu.

An effort to recreate the 1918 flu strain (a subtype of avian strain H1N1) was a collaboration among the Armed Forces Institute of Pathology, the USDA ARS Southeast Poultry Research Laboratory, and Mount Sinai School of Medicine in New York City. The effort resulted in the announcement (on 5 October 2005) that the group had successfully determined the virus's genetic sequence, using historic tissue samples recovered by pathologist Johan Hultin from an Inuit female flu victim buried in the Alaskan permafrost and samples preserved from American soldiers[203] Roscoe Vaughan and James Downs.[204][205]

On 18 January 2007, Kobasa et al. (2007) reported that monkeys (*Macaca fascicularis*) infected with the recreated flu strain exhibited classic symptoms of the 1918 pandemic, and died from cytokine storms[206] – an overreaction of the immune system. This may explain why the 1918 flu had its surprising effect on younger, healthier people, as a person with a stronger immune system would potentially have a stronger overreaction.[207]

On 16 September 2008, the body of British politician and diplomat Sir Mark Sykes was exhumed to study the RNA of the flu virus in efforts to understand the genetic structure of modern H5N1 bird flu. Sykes had been buried in 1919 in a lead coffin which scientists hoped had helped preserve the virus.[208] The coffin was found to be split and the cadaver badly decomposed; nonetheless, samples of lung and brain tissue were taken.[209]

In December 2008, research by Yoshihiro Kawaoka of the University of Wisconsin linked the presence of three specific genes (termed PA, PB1, and PB2) and a nucleoprotein derived from 1918 flu samples to the ability of the flu virus to invade the lungs and cause pneumonia. The combination triggered similar symptoms in animal testing.[210]

In June 2010, a team at the Mount Sinai School of Medicine reported the 2009 flu pandemic vaccine provided some cross-protection against the 1918 flu pandemic strain.[211]

One of the few things known for certain about the influenza in 1918 and for some years after was that it was, except in the laboratory, exclusively a disease of human beings.[212]

In 2013, the AIR Worldwide Research and Modeling Group "characterized the historic 1918 pandemic and estimated the effects of a similar pandemic occurring today using the AIR Pandemic Flu Model". In the model, "a modern day 'Spanish flu' event would result in additional life insurance losses of between US$15.3–27.8 billion in the United States alone", with 188,000–337,000 deaths in the United States.[213]

In 2018, Michael Worobey, an evolutionary biology professor at the University of Arizona who is examining the history of the 1918 pandemic, revealed that he obtained tissue slides created by William Rolland, a physician who reported on a respiratory illness likely to be the virus while a pathologist in the British military during World War One.[214] Rolland had authored an article in the *Lancet* during 1917 about a respiratory illness outbreak beginning in 1916 in Étaples, France.[215][216] Worobey traced recent references to that article to family members who had retained slides that Rolland had prepared during that time. Worobey extracted tissue from the slides to potentially reveal more about the origin of the pathogen.[*citation needed*]

Saved Wikipedia Article on "Spanish Flu Research" (July 3 2020)

See [HK0026][GDrive]

Spanish flu research concerns scientific research regarding the causes and characteristics of the "Spanish flu," a variety of influenza that in 1918 was responsible for the worst influenza pandemic in modern history. Many theories about the origins and progress of the Spanish flu persisted in the literature, but it was not until 2005, when various samples were recovered from American World War I soldiers and an Inuit woman buried in the Alaskan tundra, that significant research was made possible.

Origin of virus

There are two prevailing theories usually postulated.[*citation needed*] One theory by Alfred W. Crosby is that the virus strain originated at Fort Riley, Kansas, by two genetic mechanisms – genetic drift and antigenic shift – in viruses in poultry and swine which the fort bred for local consumption. Though initial data from a recent reconstruction of the virus suggested that it jumped directly from birds to humans, without traveling through swine,[a] this has since been cast into doubt. One researcher published in 2004 argued that the disease was found in Haskell County, Kansas, as early as January 1918.[2] A similar and even more deadly virus had been seen earlier at British camps in France and at Aldershot.[3]

Earlier investigative work published in 2000 by a team led by British virologist, John Oxford[4] of St Bartholomew's Hospital and the Royal London Hospital, suggested that a principal British troop staging camp in Étaples, France, was at the center of the 1918 flu pandemic or at least a significant precursor virus to it. There had been a mysterious respiratory infection at the military base during the winter of 1915–1916.[5]

Discovery of viral genomes

Dr. Jeffery Taubenberger and Dr. Ann Reid reviewing a genetic sequence from the 1918 Spanish flu virus.

Centers for Disease Control and Prevention as Dr. Terrence Tumpey examines a reconstructed version of the 1918 flu.

In February 1997, Johan Hultin recovered samples of the 1918 influenza from the frozen corpse of a Native Alaskan woman buried for nearly eight decades in permafrost near Brevig Mission, Alaska.[6] He brought the samples to a team[*where?*] led by Jeffery Taubenberger of the US Armed Forces Institute of Pathology (AFIP). Brevig Mission lost approximately 85% of its population to the 1918 flu in November 1918. One of the four recovered samples contained viable genetic material of the virus. This sample provided scientists a first-hand opportunity to study the virus, which was inactivated with guanidinium

viable genetic material of the virus. This sample provided scientists a first-hand opportunity to study the virus, which was inactivated with guanidinium thiocyanate before transport. This sample and others found in AFIP archives allowed researchers to completely analyze the critical gene structures of the 1918 virus.

"We have now identified three cases: The Brevig Mission case and two archival cases that represent the only known sources of genetic material of the 1918 influenza virus," said Taubenberger, chief of AFIP's molecular pathology division and principal investigator on the project.[7][b]

The archived autopsy samples had been taken from WWI Army privates Roscoe Vaughan and James Downs.[9]

Wikinews has related news:

- Scientists recreating the 1918 flu virus suggest that it may have come from birds

The 6 February 2004 edition of *Science* magazine reported that two research teams, one led by Sir John Skehel, director of the National Institute for Medical Research in London, another by professor Ian Wilson of The Scripps Research Institute in San Diego, had managed to synthesize the hemagglutinin protein responsible for the flu outbreak of 1918. They did this by piecing together DNA from a lung sample from an Inuit woman buried in the Alaskan tundra and a number of preserved samples from American soldiers of the First World War. The teams had analyzed the structure of the gene and discovered how subtle alterations to the shape of a protein molecule had allowed it to move from birds to humans with such devastating effects.

On 5 October 2005, Tumpey and other researchers at the Centers for Disease Control and Prevention (CDC) in Atlanta, Georgia, and the Mount Sinai School of Medicine in New York, announced that the (~13 kbp) genetic sequence of the 1918 flu strain, a subtype of avian strain H1N1, had been reconstructed using historic tissue samples and a small part of the RNA from a modern strain.[10][11][12]

Characteristics of virus

Influenza viruses have a relatively high mutation rate that is characteristic of RNA viruses. The H5N1 virus has mutated into a variety of types with differing pathogenic profiles; some pathogenic to one species but not others, some pathogenic to multiple species.[13] The ability of various influenza strains to show species-selectivity is largely due to variation in the hemagglutinin genes. Genetic mutations in the hemagglutinin gene that cause single amino acid substitutions can significantly alter the ability of viral hemagglutinin proteins to bind to receptors on the surface of host cells. Such mutations in avian H5N1 viruses can change virus strains from being inefficient at infecting human cells to being as efficient in causing human infections as more common human influenza virus types.[14]

In July 2004, researchers led by H. Deng of the Harbin Veterinary Research Institute, Harbin, China, and Robert Webster of the St. Jude Children's Research Hospital, Memphis, Tennessee, reported results of experiments in which mice had been exposed to 21 isolates of confirmed H5N1 strains obtained from ducks in China between 1999 and 2002. They found "a clear temporal pattern of progressively increasing pathogenicity."[15] Results reported by Webster in July 2005 reveal further progression toward pathogenicity in mice and longer virus shedding by ducks.

In December 2008, research by Yoshihiro Kawaoka of University of Wisconsin showed the presence of the three specific genes (termed PA, PB1, and PB2) and a nucleoprotein derived from the H1N1 1918 flu samples was enough to trigger similar symptoms in animal testing.[16]

Research of viral pathogenesis

Recent research of Taubenberger *et al*. has suggested that the 1918 virus, like H5N1, could have arisen directly from an avian influenza virus.[11] However, researchers at University of Virginia and Australian National University have suggested that there may be an alternative interpretation of the data used in the Taubenberger *et al*. paper.[17][18] Taubenberger *et al*. responded to these letters and defended their original interpretation.[19]

Other research by Tumpey and colleagues who reconstructed the H1N1 virus of 1918 came to the conclusion that it was most notably the polymerase genes and the HA and NA genes that caused the extreme virulence of this virus.[12] On 18 January 2007, Kobasa *et al*. reported that infected monkeys (*Macaca fascicularis*) exhibited classic symptoms of the 1918 pandemic and died from a cytokine storm.[20]

The sequences of the polymerase proteins (PA, PB1, and PB2) of the 1918 virus and subsequent human viruses differ by only 10 amino acids from the avian influenza viruses. Viruses with 7 of the 10 amino acids in the human influenza locations have already been identified in currently circulating H5N1. This has led some researchers to suggest that other mutations may surface and make the H5N1 virus capable of human-to-human transmission.

Another important factor is the change of the HA protein to a binding preference for alpha-2,6 sialic acid (the major form found in the human respiratory tract). In avian virus the HA protein preferentially binds to alpha-2,3 sialic acid, which is the major form in the avian enteric tract. It has been shown that only a single amino acid change can result in the change of this binding preference. Altogether, only a handful of mutations may need to take place in order for H5N1 avian flu to become a pandemic virus like the one of 1918. However it is important to note that likelihood of mutation does not indicate the likelihood for the evolution of such a strain, since some of the necessary mutations may be constrained by stabilizing selection.

Blood plasma as an effective treatment

In the event of another pandemic, US military researchers have proposed reusing a treatment from the deadly pandemic of 1918 in order to blunt the effects of the flu: Some military doctors injected severely afflicted patients with blood or blood plasma from people who had recovered from the flu. Data collected during that time indicates that the blood-injection treatment reduced mortality rates by as much as 50 percent.[21]

Navy researchers have launched a test to see if the 1918 treatment will work against deadly Asian bird flu. Results thus far have been inconclusive.[*citation needed*] Human H5N1 plasma may be an effective, timely, and widely available treatment for the next flu pandemic.[*citation needed*] A new international study using modern data collection methods, would be a difficult, slow process. Citing the months-long wait for a vaccine for the next pandemic, many flu experts are of the opinion that the 1918 method is something to consider.[22]

In the worldwide 1918 flu pandemic, "physicians tried everything they knew, everything they had ever heard of, from the ancient art of bleeding patients, to administering oxygen, to developing new vaccines and sera (chiefly against what we now call *Hemophilus influenzae* – a name derived from the fact that it was originally considered the etiological agent – and several types of pneumococci). Only one therapeutic measure showed any hint of success: Transfusing blood from recovered patients to new victims."[23]

2018 Article - "Part 1 : Did a Military Experimental Vaccine in 1918 Kill 50-100 Million People Blamed as Spanish Flu?" , From "First Freedoms Inc.", Distributed on "VaccineImpact dot com"

See [HW002Z][GDrive]

by Kevin Barry, President : First Freedoms, Inc.

NOTE - the following is from FreePress,org at [HW0031][GDrive]

The "Spanish Flu" killed an estimated 50-100 million people during a pandemic 1918-19. What if the story we have been told about this pandemic isn't true?

What if, instead, the killer infection was neither the flu nor Spanish in origin?

Newly analyzed documents reveal that the "Spanish Flu" may have been a military vaccine experiment gone awry.

In looking back on the 100th anniversary of the end of World War I, we need to delve deeper to solve this mystery.

Summary

- The reason modern technology has not been able to pinpoint the killer influenza strain from this pandemic is because influenza was not the killer.
- More soldiers died during WWI from disease than from bullets.
- The pandemic was not flu. An estimated 95% (or higher) of the deaths were caused by bacterial pneumonia, not influenza/a virus.
- The pandemic was not Spanish. The first cases of bacterial pneumonia in 1918 trace back to a military base in Fort Riley, Kansas.
- From January 21 – June 4, 1918, an experimental bacterial meningitis vaccine cultured in horses by the Rockefeller Institute for Medical Research in New York was injected into soldiers at Fort Riley.
- During the remainder of 1918 as those soldiers – often living and traveling under poor sanitary conditions – were sent to Europe to fight, they spread bacteria at every stop between Kansas and the frontline trenches in France.
- One study describes soldiers "with active infections (who) were aerosolizing the bacteria that colonized their noses and throats, while others—often, in the same "breathing spaces"—were profoundly susceptible to invasion of and rapid spread through their lungs by their own or others' colonizing bacteria." (1)
- The "Spanish Flu" attacked healthy people in their prime. Bacterial pneumonia attacks people in their prime. Flu attacks the young, old and immunocompromised.
- When WW1 ended on November 11, 1918, soldiers returned to their home countries and colonial outposts, spreading the killer bacterial pneumonia worldwide.
- During WW1, the Rockefeller Institute also sent the antimeningococcic serum to England, France, Belgium, Italy and other countries, helping spread the epidemic worldwide.

During the pandemic of 1918-19, the so-called "Spanish Flu" killed 50-100 million people, including many soldiers.

Many people do not realize that disease killed far more soldiers on all sides than machine guns or mustard gas or anything else typically associated with WWI.

I have a personal connection to the Spanish Flu. Among those killed by disease in 1918-19 are members of both of my parents' families.

On my father's side, his grandmother Sadie Hoyt died from pneumonia in 1918. Sadie was a Chief Yeoman in the Navy. Her death left my grandmother Rosemary and her sister Anita to be raised by their aunt. Sadie's sister Marian also joined the Navy. She died from "the influenza" in 1919.

On my mother's side, two of her father's sisters died in childhood. All of the family members who died lived in New York City.

I suspect many American families, and many families worldwide, were impacted in similar ways by the mysterious Spanish Flu.

In 1918, "influenza" or flu was a catchall term for disease of unknown origin. It didn't carry the specific meaning it does today.

It meant some mystery disease which dropped out of the sky. In fact, influenza is from the Medieval Latin "influential" in an astrological sense, meaning a visitation under the influence of the stars.

WHY IS WHAT HAPPENED 100 YEARS AGO IMPORTANT NOW?

Between 1900-1920, there were enormous efforts underway in the industrialized world to build a better society. I will use New York as an example to discuss three major changes to society which occurred in NY during that time and their impact on mortality from infectious diseases.

1. Clean Water and Sanitation

In the late 19th century through the early 20th century, New York built an extraordinary system to bring clean water to the city from the Catskills, a system still in use today. New York City also built over 6000 miles of sewer to take away and treat waste, which protects the drinking water. The World Health Organization acknowledges the importance of clean water and sanitation in combating infectious diseases. (2)

2. Electricity

In the late 19th century through the early 20th century, New York built a power grid and wired the city so power was available in every home. Electricity allows for refrigeration. Refrigeration is an unsung hero as a public health benefit. When food is refrigerated from farm to table, the public is protected from potential infectious diseases. Cheap renewable energy is important for many reasons, including combating infectious diseases.

3. Pharmaceutical

In the late 19th century through the early 20th century, New York became the home of the Rockefeller Institute for Medical Research (now Rockefeller University). The Institute is where the modern pharmaceutical industry was born. The Institute pioneered many of the approaches the pharmaceutical industry uses today, including the preparation of vaccine serums, for better or worse. The vaccine used in the Fort Riley experiment on soldiers was made in horses.

US Mortality Rates data from the turn of the 20th century to 1965 clearly indicates that clean water, flushing toilets, effective sewer systems and refrigerated foods all combined to effectively reduce mortality from infectious diseases BEFORE vaccines for those diseases became available.

Have doctors and the pharmaceutical manufacturers taken credit for reducing mortality from infectious disease which rightfully belongs to sandhogs, plumbers, electricians and engineers?

If hubris at the Rockefeller Institute in 1918 led to a pandemic disease which killed millions of people, what lessons can we learn and apply to 2018?

THE DISEASE WAS NOT SPANISH

While watching an episode of American Experience on PBS a few months ago, I was surprised to hear that the first cases of "Spanish Flu" occurred at Fort Riley, Kansas in 1918. I thought, how is it possible this historically important event could be so badly misnamed 100 years ago and never corrected?

Why "Spanish"?

Spain was one of a few countries not involved in World War I. Most of the countries involved in the war censored their press.

Free from censorship concerns, the earliest press reports of people dying from disease in large numbers came from Spain. The warring countries did not want to additionally frighten the troops, so they were content to scapegoat Spain. Soldiers on all sides would be asked to cross no man's land into machine gun fire, which was frightening enough without knowing that the trenches were a disease breeding ground.

One hundred years later, it's long past time to drop "Spanish" from all discussion of this pandemic. If the flu started at a United States military base in Kansas, then the disease could and should be more aptly named.

In order to prevent future disasters, the US (and the rest of the world) must take a hard look at what really caused the pandemic.

It is possible that one of the reasons the Spanish Flu has never been corrected is that it helps disguise the origin of the pandemic.

If the origin of the pandemic involved a vaccine experiment on US soldiers, then the US may prefer calling it Spanish Flu instead of The Fort Riley Bacteria of 1918, or something similar. The Spanish Flu started at the location this experimental bacterial vaccine was given making it the prime suspect as the source of the bacterial infections which killed so many.

It would be much more difficult to maintain the marketing mantra of "vaccines save lives" if a vaccine experiment originating in the United States during the years of primitive manufacturing caused the deaths of 50-100 million people.

"Vaccines save lives … except we may have killed 50-100 million people in 1918-19" is a far less effective sales slogan than the overly simplistic "vaccines save lives."

THE DISEASE WHICH KILLED SO MANY WAS NOT FLU OR A VIRUS. IT WAS BACTERIAL.

During the mid-2000's there was much talk about "pandemic preparedness." Influenza vaccine manufacturers in the United States received billions of taxpayer dollars to develop vaccines to make sure that we don't have another lethal pandemic "flu," like the one in 1918-19.

Capitalizing on the "flu" part of Spanish flu helped vaccine manufacturers procure billion dollar checks from governments, even though scientists knew at the time that bacterial pneumonia was the real killer.

It is not my opinion that bacterial pneumonia was the real killer – thousands of autopsies confirm this fact.

According to a 2008 National Institute of Health paper, bacterial pneumonia was the killer in a minimum of 92.7% of the 1918-19 autopsies reviewed. It is likely higher than 92.7%.

The researchers looked at more than 9000 autopsies, and "there were no negative (bacterial) lung culture results."

"… In the 68 higher-quality autopsy series, in which the possibility of unreported negative cultures could be excluded, 92.7% of autopsy lung cultures were positive for ≥1 bacterium. … in one study of approximately 9000 subjects who were followed from clinical presentation with influenza to resolution or autopsy, researchers obtained, with sterile technique, cultures of either pneumococci or streptococci from 164 of 167 lung tissue samples.

There were 89 pure cultures of pneumococci; 19 cultures from which only streptococci were recovered; 34 that yielded mixtures of pneumococci and/or streptococci; 22 that yielded a mixture of pneumococci, streptococci, and other organisms (prominently pneumococci and nonhemolytic streptococci); and 3 that yielded nonhemolytic streptococci alone. There were no negative lung culture results." (3)

Pneumococci or streptococci were found in "164 of (the) 167 lung tissue samples" autopsied. That is 98.2%. Bacteria was the killer.

WHERE DID THE SPANISH FLU BACTERIAL PNEUMONIA OF 1918-19 ORIGINATE?

When the United States declared war in April 1917, the fledgling Pharmaceutical industry had something they had never had before – a large supply of human test subjects in the form of the US military's first draft.

Pre-war in 1917, the US Army was 286,000 men. Post-war in 1920, the US army disbanded, and had 296,000 men.

During the war years 1918-19, the US Army ballooned to 6,000,000 men, with 2,000,000 men being sent overseas. The Rockefeller Institute for Medical Research took advantage of this new pool of human guinea pigs to conduct vaccine experiments.

" A REPORT ON ANTIMENINGITIS VACCINATION AND OBSERVATIONS ON AGGLUTININS IN THE BLOOD OF CHRONIC MENINGOCOCCUS CARRIERS by Frederick L. Gates (From the Base Hospital, Fort Riley, Kansas, and The Rockefeller Institute for Medical Research, New York. / Received 1918 Jul 20) " See [HG005A][GDrive]

(Author note: Please read this Fort Riley paper in its entirety so you can appreciate the carelessness of the experiments conducted on these troops.)

(Author note: Please read this Fort Riley paper in its entirety so you can appreciate the carelessness of the experiments conducted on these troops.)

Between January 21st and June 4th of 1918, []reports on an experiment where soldiers were given 3 doses of a bacterial meningitis vaccine. Those conducting the experiment on the soldiers were just spitballing dosages of a vaccine serum made in horses.

The vaccination regime was designed to be 3 doses. 4,792 men received the first dose, but only 4,257 got the 2nd dose (down 11%), and only 3702 received all three doses (down 22.7%).

A total of 1,090 men were not there for the 3rd dose. What happened to these soldiers? Were they shipped East by train from Kansas to board a ship to Europe? Were they in the Fort Riley hospital? [The report from [Dr. Frederick Lamont Gates (born 1886)] report doesn't tell us.

An article accompanying the American Experience broadcast I watched sheds some light on where these 1,090 men might be. [Dr. Frederick Lamont Gates (born 1886)] began his experiments in January 1918.

By March of that year, "100 men a day" were entering the infirmary at Fort Riley.

Are some of these the men missing from Dr. Gates' report – the ones who did not get the 2nd or 3rd dose?

"… Shortly before breakfast on Monday, March 11, the first domino would fall signaling the commencement of the first wave of the 1918 influenza.

Company cook Albert Gitchell reported to the camp infirmary with complaints of a "bad cold."

Right behind him came Corporal Lee W. Drake voicing similar complaints.

By noon, camp surgeon Edward R. Schreiner had over 100 sick men on his hands, all apparently suffering from the same malady…" (5)

[Dr. Frederick Lamont Gates (born 1886)] does report that several of the men in the experiment had flu-like symptoms: coughs, vomiting and diarrhea after receiving the vaccine.

These symptoms are a disaster for men living in barracks, travelling on trains to the Atlantic coast, sailing to Europe, and living and fighting in trenches.

The unsanitary conditions at each step of the journey are an ideal environment for a contagious disease like bacterial pneumonia to spread.

From Dr. Gates' report:

"Reactions.– … Several cases of looseness of the bowels or transient diarrhea were noted. This symptom had not been encountered before. Careful inquiry in individual cases often elicited the information that men who complained of the effects of vaccination were suffering from mild coryza, bronchitis, etc., at the time of injection."

"Sometimes the reaction was initiated by a chill or chilly sensation, and a number of men complained of fever or feverish sensations during the following night.

Next in frequency came nausea (occasionally vomiting), dizziness, and general "aches and pains" in the joints and muscles, which in a few instances were especially localized in the neck or lumbar region, causing stiff neck or stiff back. A few injections were followed by diarrhea.

The reactions, therefore, occasionally simulated the onset of epidemic meningitis and several vaccinated men were sent as suspects to the Base Hospital for diagnosis."(4)

According to [Dr. Frederick Lamont Gates (born 1886)], they injected random dosages of an experimental bacterial meningitis vaccine into soldiers. Afterwards, some of the soldiers had symptoms which "simulated" meningitis, but Dr. Gates advances the fantastical claim that it wasn't actual meningitis.

The soldiers developed flu-like symptoms. Bacterial meningitis, then and now, is known to mimic flu-like symptoms. (6)

Perhaps the similarity of early symptoms of bacterial meningitis and bacterial pneumonia to symptoms of flu is why the vaccine experiments at Fort Riley have been able to escape scrutiny as a potential cause of the Spanish Flu for 100 years and counting.

HOW DID THE "SPANISH FLU" SPREAD SO WIDELY SO QUICKLY?

There is an element of a perfect storm in how the [Dr. Frederick Lamont Gates (born 1886)] bacteria spread. WWI ended only 10 months after the first injections. Unfortunately for the 50-100 million who died, those soldiers injected with horse-infused bacteria moved quickly during those 10 months.

An article from 2008 on the CDC's website describes how sick WWI soldiers could pass along the bacteria to others by becoming "cloud adults."

"Finally, for brief periods and to varying degrees, affected hosts became "cloud adults" who increased the aerosolization of colonizing strains of bacteria, particularly pneumococci, hemolytic streptococci, H. influenzae, and S. aureus.

For several days during local epidemics—particularly in crowded settings such as hospital wards, military camps, troop ships, and mines (and trenches)—some persons were immunologically susceptible to, infected with, or recovering from infections with influenza virus.

Persons with active infections were aerosolizing the bacteria that colonized their noses and throats, while others—often, in the same "breathing spaces"—were profoundly susceptible to invasion of and rapid spread through their lungs by their own or others' colonizing bacteria." (1)

Three times in his report on the Fort Riley vaccine experiment, [Dr. Frederick Lamont Gates (born 1886)] states that some soldiers had a "severe reaction" indicating "an unusual individual susceptibility to the vaccine".

While the vaccine made many sick, it only killed those who were susceptible to it. Those who became sick and survived became "cloud adults" who spread the bacteria to others, which created more cloud adults, spreading to others where it killed the susceptible, repeating the cycle until there were no longer wartime unsanitary conditions, and there were no longer millions of soldiers to experiment on.

The toll on US troops was enormous and it is well documented. Dr. Carol Byerly describes how the "influenza" traveled like wildfire through the US military. (substitute "bacteria" for Dr. Byerly's "influenza" or "virus"):

"… Fourteen of the largest training camps had reported influenza outbreaks in March, April, or May, and some of the infected troops carried the virus with them aboard ships to France …

As soldiers in the trenches became sick, the military evacuated them from the front lines and replaced them with healthy men.

This process continuously brought the virus into contact with new hosts—young, healthy soldiers in which it could adapt, reproduce, and become extremely virulent without danger of burning out.

… Before any travel ban could be imposed, a contingent of replacement troops departed Camp Devens (outside of Boston) for Camp Upton, Long Island, the Army's debarkation point for France, and took influenza with them.

Medical officers at Upton said it arrived "abruptly" on September 13, 1918, with 38 hospital admissions, followed by 86 the next day, and 193 the next.

Hospital admissions peaked on October 4 with 483, and within 40 days, Camp Upton sent 6,131 men to the hospital for influenza. Some developed pneumonia so quickly that physicians diagnosed it simply by observing the patient rather than listening to the lungs…" (7)

The United States was not the only country in possession of the Rockefeller Institute's experimental bacterial vaccine.

A 1919 report from the Institute states: "Reference should be made that before the United States entered the war (in April 1917) the Institute had resumed the preparation of antimeningococcic serum, in order to meet the requests of England, France, Belgium Italy and other countries."

The same report states: "In order to meet the suddenly increased demand for the curative serums worked out at the Institute, a special stable for horses was quickly erected …" (8)

An experimental antimeningoccic serum made in horses and injected into soldiers who would be entering the cramped and unsanitary living conditions of war … what could possibly go wrong?

Is the bacterial serum made in horses at the Rockefeller Institute which was injected into US soldiers and distributed to numerous other countries responsible for the 50-100 million people killed by bacterial lung infections in 1918-19?

The Institute says it distributed the bacterial serum to England, France, Belgium, Italy and other countries during WWI. Not enough is known about how these countries experimented on their soldiers.

I hope independent researchers will take an honest look at these questions.

THE ROAD TO HELL IS PAVED WITH GOOD INTENTIONS

I do not believe that anyone involved in these vaccine experiments was trying to harm anyone.

Some will see the name Rockefeller and yell. "Illuminati!" or "culling the herd!"

I do not believe that's what happened.

I believe standard medical hubris is responsible – doctors "playing God", thinking they can tame nature without creating unanticipated problems.

With medical hubris, I do not think the situation has changed materially over the past 100 years.

WHAT NOW?

The vaccine industry is always looking for human test subjects. They have the most success when they are able to find populations who not in a position to refuse.

Soldiers (9), infants, the disabled, prisoners, those in developing nations – anyone not in a position to refuse.

Vaccine experimentation on vulnerable populations is not an issue of the past. Watch this video clip of Dr. Stanley Plotkin where he describes using experimental vaccines on orphans, the mentally retarded, prisoners, and those under colonial rule.

The deposition was in January 2018. The hubris of the medical community is the same or worse now than it was 100 years ago.

Watch as Dr. Plotkin admits to writing:

"The question is whether we are to have experiments performed on fully functioning adults and on children who are potentially contributors to society or to perform initial studies in children and adults who are human in form but not in social potential."

Please watch the horrifying video clip.(10) : "Dr. Stanley "Human-in-Form" Plotkin, re: experiments on orphans/mentally retarded/prisoners" / Video - [HV006O][GDrive]

In Part 1 (1) (See [HW002Z][GDrive]), I asked if medical products made in horses may have played a role in the new disease which killed millions worldwide in the pandemic of 1918-19.

The December 1917 issue of Popular Mechanics magazine is BELOW - sheds light on the vaccine manufacturing process of 100 years ago.

The feature article, “How New York City’s Health Department Makes Serums and Vaccines for the United States Army” describes processes in place in 1917:

“After the horse has been inoculated with the disease poison in gradually increasing doses he is bled and his serum is found to be antitoxin.

This is administered to human beings and renders them immune to the disease …. Some horses give more antitoxin serum than others.

The same horse may be used at several different times for the preparation of distinctly different antitoxins … Horses are used in the preparation of diphtheria, tetanus antitoxin and antimeningococcus serum. “

It is difficult to believe that they used the same horses to make multiple disease serums, but they did.

If safety had been a concern, perhaps certain horses would have been dedicated to producing serum for one disease (or “poison” as the article calls it), but safety does not appear to be on the list of concerns.

These muddled and potentially contaminated serums were then given to soldiers (and to the public).

Recovering the diphtheria serum from horse blood in Marburg, Germany, drawn from nature by Fritz Gehrke, 1890s

PREVIOUS | NEXT (1/15)

Humans and animals have natural defense systems that produce antibodies in the blood to combat bacteria and other harmful substances invading the body. In the late nineteenth century, scientists investigating this immune response in animals developed new methods for treating diseases in humans.

One of these early therapies used blood serum, collected from animals inoculated with toxins from bacteria. The natural protection these animals developed against the toxin could be passed to humans through injections of the serum. In commercial production, horses and other large animals served as living serum factories to grow the so-called “antitoxins” for human use.

Serum therapy provided an effective cure for diphtheria, an often fatal childhood disease. The demand for serum established a new drug industry that required the use of large numbers of animals for production.

How New York City's Health Department Makes Serums and Vaccines for the United States Army

Preparing the Bacteria

In the preparation of typhoid vaccine the bacteria are grown in the bottles you see on the table. The germs are killed by pouring a salt solution over them. The bottle on the shelf contains the salt solution which is being siphoned into the bottle containing the colony of typhoid fever germs.

Transferring the Bacilli

Tetanus bacilli occur in dust, earth and manure. They do not grow in the presence of oxygen and are particularly dangerous if they get into deep wounds. The young lady in the photograph is drawing up tetanus bacilli from the bottom of a test tube be means of a glass tube which she holds in her mouth. Thus the germs are transferred from tube to tube.

The Resultant Powerful Toxin

Here the large flask is being inoculated with tetanus bacilli. The small wire basket at the right contains test tubes in which are the tetanus germs. The flame which you see just to the right of the flask which is being inoculated is kept burning so that any instrument may be immediately sterilized after exposure.

The Final Step

The finished product containing millions of dead typhoid fever bacilli is poured by means of a siphon into large bottles. The vaccine is kept in a refrigerator until it is needed for use. Note the milky appearance of the vaccine.

A Glimpse into the "Shop" of the Laboratories

This photograph shows the refrigerator in the Bacteriological Laboratories of the Department of Health of the City of New York, where serums, vaccines and anti-toxins are prepared for the use of the United States Army. Much of this material will be shipped to the front. In the containers and bottles which you see on the shelves is $150,000 worth of material. There is enough diphtheria antitoxin to treat 75,000 men, enough tetanus antitoxin for 200,000 men, enough smallpox vaccine for a half million men and enough antimeningococcus serum to treat 2,500 men suffering from cerebrospinal meningitis.

Bleeding the Horse to Obtain the Serum

After the horse has been inoculated with the disease poison in gradually increasing doses he is bled and his serum is found to be antitoxin. This is administered to human beings and renders them immune to the disease. The horses are kept in the pink of condition. At periodic intervals they are given a rest. During the rest periods they are turned out to grass. When thoroughly rested, they are inoculated again. Some horses give more antitoxin serum than others. The same horse may be used at several different times for the preparation of distinctly different antitoxins.

Inoculating a Horse with Toxin

One of the 73 horses in the stables of the Department of Health of the City of New York at Ctisville. This horse is being inoculated with diphtheria toxin. Small doses gradually increased render the horse immune to diphtheria. Horses are used in the preparation of diphtheria, tetanus antitoxin and antimeningococcus serum.

SPECIES JUMP?

Were pathogens transferred from these horses to humans in mass quantities in ways they had never transferred before?

Humans and horses had interacted closely for centuries, but horse serum had not been injected into humans in that way before, bypassing the human immune system.

Is it possible that this new method of exposure caused the bacterial pneumonias which ripped human lungs apart in ways never seen before?

Could pathogens relatively harmless to horse lungs make a species-jump and destroy human lungs?

In 1919, a Dutch military veterinarian named Captain Emile Bemelmans “developed an extensive theory on the relation between human and animal influenza …. In 1919, he argued that ‘the human ‘flu’ and the so-called ‘infectious disease of the breast’ of horses are exactly identical in aetiological, bacteriological and epidemiological senses.’

In her 2014 paper “‘Spanish’ flu and army horses: what historians and biologists can learn from a history of animals with flu during the 1918–1919 influenza pandemic”, Dr. Floor Haalboom describes Bemelmans’s work:

“In 1919, Bemelmans’s argument on the identical nature of human and horse influenza in the Nederlandsch Tijdschrift voor Geneeskunde (the Dutch medical journal) was reviewed in the veterinary journal,

… in 1914 he extended his theory on horse flu to several human and animal infectious diseases in an article in the Dutch medical journal. Bemelmans listed human influenza as an example among many other animal and human diseases which he thought were accompanied by (deadly) infections of streptococci.

Although he did not yet argue that human and horse flu were exactly equal, he did explicitly note their similarities: ‘Also between the human influenza and the so-called breast disease in horses peculiar similarities exist’…

… In these papers, Bemelmans addressed the nature of influenza (although he still preferred the name ‘flu’) of both humans and horses. He opposed the ideas that Pfeiffer’s bacterium or a filterable virus caused the disease, but thought toxins made by the bacteria streptococci were responsible for its deadly secondary complications. “ (4)

Dr. Bemelmans’s contemporaneous observations have largely been lost to history, in part because of the self important attitude of the medical community.

The hubris of the medical community prevented them from listening to a lowly veterinarian.

However, Dr. Bemelmans’s observations and persistence in getting them published are extraordinarily valuable. His awareness at the time that bateria was the killer of both humans and horses in the pandemic of 1918-19 put him decades ahead of his contemporaries.

The NIH paper describing bacteria as the predominant killer was published in 2008.(5)

See https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2599911/ https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2599911/pdf/nihms76103.pdf

If Dr. Bemelmans was correct that horses and humans were suffering from an identical disease, are there diseases identical (or very similar) in both horses and humans? Do any of those diseases target the lungs?

"Animal Models – A Neglected Medical Resource", Cornelius, CE, DVM, Ph.D.N Engl J Med 1969; 281:934-944 (6)

In a 1969 paper, Kansas State University veterinarian Dr. Charles E. Cornelius compiled a list of diseases which were very similar or identical in humans and various other species. Among the diseases identical/very similar in humans and horses is pulmonary emphysema, which targets the lungs.

Did a pathogen which causes pulmonary emphysema "species-jump" from horses to humans in these serums and vaccines?

The vaccines were obviously manufactured in primitive, unavoidably unsafe conditions and then given to WW1 soldiers as an experiment.

What exactly was in the serums and vaccines made in the horses at the Rockefeller Institute – especially considering that the same individual horses were used to for variety of serums for multiple diseases?

Recall from Part 1 that Streptococci bacteria were commonly found in the tissue samples from the autopsies of those who died in 1918-19. (5)

Cornelius said human and horse pulmonary emphysema are identical. Bemelmans reported that humans and horses were suffering from the same disease.

Did doctors treating soldiers suffering from "Spanish Flu" report on encountering a new killer type of pulmonary emphysema, causing lung damage that they had ever seen before?

PULMONARY EMPHYSEMA AT CAMP HANCOCK GEORGIA

"Acute Pulmonary Emphysema Observed During the Epidemic of Influenzal Pneumonia at Camp Hancock, Georgia"Robert G. Torrey American Journal of the Medical Sciences 1919, p. 170 – 181 (7)

Captain Dr. Torrey served at Camp Hancock, just outside of Augusta, GA. The soldiers who came through Camp Hancock were likely on their way to Charleston, SC to board ships to France, but many of them would not survive to get to the front.

Thousands died at Camp Hancock. Some who survived the illness likely made it to the ships, potentially passing the infectious bacteria to other soldiers in the unsanitary conditions which were rampant during WWI.

From Dr. Torrey's report:

"Summary

… Certain conditions were invariably present, including an intense bronchitis and peribronchitis similar to that found in a previous epidemic of pure hemolytic streptococcus infection (Scarlet Fever). There was also present from the first a destructive softening of the lung parenchyma.

In addition to this there was always an early and persisting generalized pulmonary emphysema which frequently was the main factor in causing death by interference with the mass movement of venous blood.

These conditions were found in every case examined at autopsy. Except for frequent otitis media (ear infection) there were almost no complications or sequelae outside of the chest.

The pulmonary emphysema, with consequent venous stasis, accounted for the cyanosis (turning blue/purple color), epistaxis (nosebleeds) and fixation of the chest in the phase of extreme inspiration (inhaling), with low stand of the diaphragm, which characterized these cases, and also accounted for the paradoxical physical signs (paradoxical breathing) in which fluid developed in the chest."

Torrey describes what happened to these soldiers as they died. They were coughing, becoming "cloud adults" (8) (as described in Part 1).

It looked like a bacterial infection to him. Autopsies showed lung tissue had been damaged, which restricted blood flow, turning the dying a bluish/purple color, due to lack of oxygen.

When the patients tried to inhale, their diaphragms constricted instead of expanded, the opposite of what diaphragms are supposed to do.(9) Fluids then filled their lungs, and many did not survive, literally the fluid in their lungs strangling the soldiers to death.

FLUID IN THE LUNGS STRANGLED THE HUMAN VICTIMS OF SPANISH FLU – STRANGLES?

There is a highly contagious horse respiratory infection called Strangles (or Distemper). If this disease can kill horses, what would it do to human lungs if introduced into humans, via injection and therefore bypassing the immune system, on a mass scale?

"Strangles is a highly contagious upper respiratory infection of horses caused by the bacteria Streptococcus equi subspecies equi (S. equi). It is transmitted by inhalation or direct contact with contaminated surfaces (for example horses sharing water buckets)." (10)

Did streptococcus equi contaminate the serums and vaccines made in horses produced at the Rockefeller Institute and injected into soldiers in a vaccine experiment? Was streptococcus equi in the medical serums given to the soldiers as treatments? Was it some other pathogen which species jumped?

Did medical hubris lead to a mistake which caused a species jump which killed 50-100 million people 100 years ago?

[....]

CATRYNA WHITE January 3, 2019 at 9:56 am - Reply

> One thing that is little known is that thousands of horses were shipped from Missouri, USA to Europe during WWI. Every single one of the received what is referred to as a "flu bacterium." So, not only were the soldiers and eventually the citizenry inoculated with all manner of filth, but the horses used in the war, were too.

2018 (January) Interview - "Dr. Stanley "Human-in-Form" Plotkin, re: experiments on orphans/mentally retarded/prisoners"

1918 (July) Report - A REPORT ON ANTIMENINGITIS VACCINATION AND OBSERVATIONS ON AGGLUTININS IN THE BLOOD OF CHRONIC MENINGOCOCCUS CARRIERS.

BY [Dr. Frederick Lamont Gates (born 1886)] / First Lieutenant, Medical Corps, U. S. Army.

(From the Base Hospital, Fort Riley, Kansas, and The Rockefeller Institute ./or Medical Research, New York.) (Received for publication, July 20, 1918.)

Source : [HG005A][GDrive]

Following an outbreak of epidemic meningitis at Camp Funston, Kansas, in October and November, 1917, a series of antimeningitis vaccinations was undertaken on volunteer subjects from the camp. Major E. H. Schorer, Chief of the Laboratory Section at the adjacent Base Hospital at Fort Riley, offered every facility at his command and cooperated in the laboratory work connected with the vaccinations. In the camp, under the direction of the Division Surgeon, Lieutenant Colonel J. L. Shepard, a preliminary series of vaccinations on a relatively small number of volunteers served to determine the appropriate doses and the resultant local and general reactions. Following this series, the vaccine was offered by the Division Surgeon to the camp at large, and "given by the regimental surgeons to all who wished to take it.

Preliminary Series.

The preliminary series of vaccinations was carried out in the 342nd Field Artillery Regiment through the courtesy of Colonel Nugent and Major Czar C. Johnson, surgeon of the regiment. This organization volunteered en masse in response to the call issued by the Division Surgeon and offered a most promising opportunity for an extended series of observations. Moreover, only one case of meningitis had developed in the 342nd Field Artillery and the regiment had recently been covered in the search for meningococcus carriers. During the first experience the vaccination of known carriers was avoided and this regiment appeared to be free from them.

- Choice and Preparation o' Vacc'ne.--That at least two serologically distinct disease-producing types of meningococci exist has been known since Dopter(1) in 1909 described the "parameningococcus" obtained first from the nasopharynx and then from the blood and spinal fluid of active cases of epidemic meningitis. Following Dopter's discovery Wollstein(2) confirmed the serological distinction between normal or regular meningococci and parameningococci by a comparative study of agglutination, opsonization, and complement fixation of the two types, concluding that :
- "Because of the variations and irregularities of serum reactions existing among otherwise normal strains of meningococci it does not seem either possible or desirable to separate the parameningococci into a strictly definite class. It appears desirable to consider them as constituting a special strain among meningococci not, however, wholly consistent in itself."
- In a more recent study based on absorption of agglutinin and agglutination tests Gordon (3) has distinguished four groups of meningococci which be calls Types I. II, III, and IV. Groups I and II are distinct and correspond to the known types. They are responsible for 75 to 85 per cent of the cases of epidemic meningitis. Other meningococci he separates into Types III and IV. Tulloch (4) finds, however, that definite group relationships exist between Types I and III, and II and IV, so that a I - I I I group type and a II-IV group type can be distinguished. These and certain other strains can be classified only by the absorption of agglutinin test, since they agglutinate in two or more of the type sera. Type II also 'appears to include a complex subgroup and shows considerable variation among the cocci comprised therein." Nicolle, Debains, and Jouan, (5) employing a rapid method of agglutination or flocculation (without incubation) in low dilutions of immune horse serum, have also reported four types of the meningococcus which they designate A (Gordon I and III, regular meningococcus), B (Gordon II and IV, parameningococcus), C, and D. Types A and B are common, Types C and D relatively rare. They find that certain meningococci are related to two or more of their specific types and must therefore be classed as "indeterminates."
- In a recent article Mathers and Herrold 6 readily distinguish the two main types by agglutination, and group around them most of their atypical strains. The strains which fail to agglutinate in type sera bave nevertheless similar antigenic properties, since "monovalent serum prepared from these strains agglutinates in a specific way meningococci belonging to one or the other of t~e large biologic groups."

It appears, therefore, that while two distinct types or groups of meningococci may be clearly differentiated, most of the other organisms that do not fall strictly within these two groups are either intermediates or irregular variants of one or the other. Meningococci of other types in as far as they can be distinguished are only occasionally responsible for a case of epidemic meningitis.

In order to cover the two pathogenic types of meningococci and variants of them, it has become the practice in this country, following the methods of Flexner and Jobling (7) and Amoss and Wollstein, (8) to prepare highly polyvalent therapeutic sera by the repeated injection of a number of representative strains with the object of producing a serum which would protect against any pathogenic strain that might be encountered. For protective inoculation high polyvalency would seem to be equally desirable, but the choice of strains for human vaccination is limited by the fact that only a few injections are practicable, whereas the production of therapeutic serum requires a long series of inoculations in which immunity is gradually built up by the repeated injection of small doses of each antigen. The inclusion of any considerable number of strains in a vaccine for human use might defeat the purpose of the vaccination by the introduction of toxic amounts of bacterial protein without a sufficient quantity of any one specific antigen to give rise to protection against its given strain. But since 70 to 85 per cent of the cases of epidemic meningitis are caused by meningococci of the two main types, the limitation of the strains in a vaccine to representatives of these types would seem to be the rational procedure, holding out hope of protection against a large proportion of disease-producing strains.

(8) Amoss, H. L., and Wollstein, M., A method for the rapid preparation of antimeningitis serum, J. Exp. Med., 1916, xxiii, 403.

Therefore, for the vaccine used at Camp Funston only three organisms were chosen from the stock of The Rockefeller Institute, but the vaccine may be

regarded as having represented the two main types of the meningococcus. It was also anticipated that the epidemic at Camp Funston might furnish some strain or strains of meningococci not closely related to the main types and which ought therefore to be included in the vaccine, but a type study at Fort Riley showed that the sixteen strains recovered from active cases in December and January would be covered by a vaccine containing normal and para strains.

Method of Preparing Vaccine.--The vaccine used was made in the laboratory of The Rockefeller Institute. 16 hour growths on 1 percent glucose agar in Blake bottles were washed off with isotonic salt solution, like strains pooled, and the concentrated suspensions immediately heated to 65°C. for 30 minutes to kill the cocci and inactivate the autolytic ferment. Experiments have shown that this temperature does not impair the antigenic properties of the organism and the intact cocci are less toxic than their autolyzed products.

Following the usual tests for purity and sterility the suspensions were standardized, diluted in 0.85 per cent salt solution, mixed in equal proportions of the three strains in concentrations of 1,000 million, 2,000 million, 4,000 million, and 8,000 million cocci per cc. and preserved with 0.35 per cent tricresol.

All the injections in the preliminary series were made strictly subcutaneously with a fine needle (No. 25) at the insertion of the deltoid muscle, usually in the left arm unless a recent vaccina "take" had occurred. Then the right arm was used. The tincture of iodine used as antiseptic was then sponged off with alcohol.

For the determination of dosage and the study of reactions and antibody formation six groups of about 50 men each were chosen from the various companies in the regiment. Successive groups received increasing doses of vaccine in a series of three injections at 4 to 10 day intervals according to the schedule in Table I.

About 25 men of Groups I, II, III, V, and VI gave preliminary (control) blood samples for the study of immunity reactions on the day of the first injection and a later specimen was obtained from as many vaccinated men as were available on the 8th to 10th day after the third injection.

At Major Johnson's direction First Lieutenant Serge Androp, Medical Corps, obtained reports from the men at inspection the morning following the vaccirrations in regard to the resulting localand general reactions.

Group No.	1st injection.	Interval.	2nd injection.	Interval.	3rd injection.	Interval. Blood samples taken.

TABLE I.
Vaccination Schedule, Preliminary Series.
[HG005B][GDrive]

Dosage and Reaction.--The determination of the dosage of vaccine for subsequent groups followed from the reports of the reactions produced by the given doses. It was considered important to increase the doses gradually in order to locate closely the zone of mild reactions and to avoid unexpectedly severe results. Accordingly, the vaccinations were begun with the injection of 500 million cocci, and this initial dose was increased in successive groups by 250 or 500 million until it had reached 2,000 million. For the second and third doses in each group, the first dose was usually multiplied by two and by four. Thus it usually happened that a given dose had already been used as a second or third in one group before it was tried as the first dose in a later series.

Only two reactions of any consequence were reported from doses of less than 2,000 million cocci. An officer in Group II who explained that he had long been hypersensitive to foreign protein and had reacted severely to the typhoid and paratyphoid vaccinations developed a severe local and general reaction, with headache and malaise, after the first injection of 750 million cocci. A second officer in Group II was similarly affected after a second injection of 1,500 million cocci and was confined to bed part of the following day. The two reactions after these small doses were merely transient, but they demonstrate a factor of individual susceptibility which was found to be of considerable importance in the determination of proper doses of vaccine.

When an initial dose of 2,000 million was reached (Group V) general reactions began to appear with greater frequency. None of the men in this group felt ill enough to report at sick call the following morning, but nine men stated upon question that they had felt feverish the preceding night. Four of them had had headache also and one reported a chill. Arms were moderately sore at the site of injection, but not sore enough to interfere with routine duties.

From this time on, a small number of the men in each group reported some local or general discomfort following the vaccination. The symptom most frequently mentioned was a "feverish sensation" often accompanied by headache, which was sometimes severe enough to cause loss of sleep. Morning temperatures, when taken, were reported normal. In a few instances there was transient nausea, malaise, or aching joint pains, and three reactions were initiated with a chill. Eight men had general reactions after the first and second doses, or after the second and third, and three complained of discomfort after all three injections.

On the whole the reactions produced by' the vaccine in the preliminary series were mild as compared with those that occasionally follow injections of typhoid or paratyphoid prophylactic and there was little complaint among the men. The occurrence of an occasional reaction of greater severity even with the smaller doses, and increasing local tenderness after the injection of the larger doses of vaccine led to the choice of relatively lower doses for the general series throughout the camp rather than the attempt to push the dosage up to the limit of endurance. Later experience fully justified this decision. Doses of 2,000, 4,000, and 8,000 million had already been decided upon when Group VI was given a second injection of 5,000 or 6,000 million and a third injection of 10,000 to determine the relative security of the chosen doses. The injection ol 10,000 million cocci caused general reactions in eleven men, but none of them was confined to bed or relieved from duty following the injection.

Finally, a seventh group of 99 men received the chosen doses of vaccine at weekly intervals about a week before the corresponding injections were given in the camp at large and served as a final check on the dosage. On giving the third injections to Group VII it was noted that many of the men still had a small painless area of subcutaneous induration at the site of the former injections. This persistent induration ~has been personally experienced after injection of meningococcus vaccine. It disappears gradually, leaving no trace. A more general discussion of reactions is reserved for the report on the larger vaccination series.

Immunity Reactions.--Agglutination is the reaction of choice for the study of antibody production with the meningococcus. It is the most delicate as well as the most specific, and is most easily made on a large number of sera and in multiple dilutions. In studying agglutination, however, several factors have to be taken into account aside from the obvious requirement of a carefully standardized technique. One of the most important is the relative agglutinability of various strains of meningococci and their response to one or both of the type (normal andpara) immune bodies. Meningococci vary also in antigenic power and not always in consonance with their agglutinability, so that it is sometimes profitable to use certain type strains as antigens and other strains to test antibody production.

Most of the control sera taken in advance of vaccination from men of Groups I, II, III, V, and VI were used up in agglutination tests against the vaccine strains in a dilution of 1: 10. Except in one instance in which the para strain was partially agglutinated, the results of these tests were uniformly negative. When the first of the serum specimens, taken on the 8th and 10th days after vaccination and tested in 1:10 dilution against the vaccine strains, also gave negative results, it was decided to collect all the available sera for later study in lower dilutions and against more easily agglutinable strains. This study was subsequently made at The Rockefeller Institute. A certain number of sera from each group was examined by macroscopic agglutination with a modification of the Wright method in dilutions of 1:2 and higher against the following strains from the stock of The Rockefeller Institute:

- No. 8. A "regular" which is also agglutinated in low dilutions of para serum.
- No. 10. An intermediate which agglutinates in both "regular" and para serum.
- No. 60. One of Dopter's paras which is relatively easily agglutinable and was represented in the vaccine.

On account of the limited amounts of serum available and the low dilutions required, the following method of agglutination was employed:

- Capillary glass tubing of an internal diameter of 2 mm. is drawn out into capsules 8 to 10 cm. long (Fig. 1). For use the ends are snapped off and a nipple is slipped on one end and folded double, giving accurate control of the aspirated fluids. A file mark measures equal volumes of serum and salt solution for successive dilutions, which are made in the capsule and deposited in a row on a plate of solid paraffin in a Petri dish. The paraffin plate is conveniently cleaned by melting off a thin layer in hot water. Equal amounts of a serum dilution and a meningococcus suspension are measured in the capsule, mixed on the paraffin plate, and drawn up to form a column about 1 to 1.5 cm. long. Four or five such specimens, separated by air bubbles, are sealed in a capsule for incubation. Only one dilution of a serum shouldbe used in a single capsule, but several meningococcus suspensions (4 billion per cc.) may be tested against it, as the admixture of specimens in the capsule is inappreciable. The capsules are woven through holes in a card which designates their contents, and incubated in a horizontal position for 24 hours at 55°C. Complete agglutination is indicated by a widespread flocculated sediment of organisms (Fig. 2). The flocculi are distributed through the clear fluid on rolling the tube briskly between the palms (Fig. 3). Absence of agglutination corresponds to a smooth line of sediment, which goes into even suspension on whirling. Partial agglutination is easily recognized in a combination of the two types of sediment. Results are read with the unaided eye or under a small hand lens.

As stated above, most of the control sera had been exhausted before this more comprehensive series of tests was undertaken. There remained fourteen normal control sera frorh Group VI, and it happened that the practically negative results obtained with the sera of Groups I, II, and III admit these specimens as controls, since the small doses of vaccine used in these groups did not give rise to demonstrable antibody formation. To these may be added twelve sera from supposed non-contacts obtained in New York City.

TABLE II.
Agglutination Tests with Sera of Vaccinated Men. Dilution 1: 2.
[HG005C][GDrive]

Table II shows the absence of agglutination in Groups I, II, and III with few exceptions. In three cases only was more than a partial agglutination of one strain in the 1 : 2 dilution observed. The titers in these cases ran as follows:

Group.	Serum.	Strain.		
		8	10	60
I	5	1:32	1:8	1:8
	24	0	1:32	0
II	77	1:8	1:32	0

[HG005D][GDrive]

It may be assumed, therefore, that the number of unvaccinated men whose sera would a g g l u t i n a t e any of these chosen strains of meningococci is small, and on the basis of this assumption the observation that twelve of fifteen sera from Group IV agglutinate Strain 10 partially or completely is unmistakable evidence of antibody formation through the agency of the vaccine. Group V, in which the dosage reached that chosen for the camp at large, confirms this evidence of reaction, for all the twenty-two sera studied contained antibodies for the meningococcus. In some instances the more easily agglutinable strains were agglutinated in a dilution of 1 : 32 or 1 : 64 (Table III).

267	0	1:8	1:8
268	0	1:64	1:8

TABLE III.
Agglutinin Titers of Sera from Group V.
[HG005E][GDrive]

The final evidence of antibody production is furnished by a direct comparison of sera from Group VI taken before the first vaccination with sera taken 9 days after the third injection of vaccine, in which the appearance or increase in agglutinins is observable in all but two instances. The presence of agglutinins in the sera from Group VII merely confirms the previous findings. It may, therefore, be stated that the injection of well tolerated doses of meningococcus vaccine is followed by specific antibody formation in the human body.

The preliminary series of vaccinations, therefore, served to establish the method of injection, the proper dosage for extended vaccination, the reactions which might be expected to follow the chosen doses, and the production of immune bodies in the serum of vaccinated men. On the basis of these findings the vaccine was offered to the camp at large.

General Series.

The vaccine used in the general series of inoculations in the camp was made by Lieutenant Peter K. Olitsky at The Rockefeller Institute by the methods already described. It was shipped to Fort Riley in bulk and was diluted in isotonic salt solution to standard concentration, preserved with 0.3 per cent cresol and distributed in 50cc. bottles to the regimental surgeons under Major Schorer's direction. The use of two suspensions, one of 4,000 million cocci per cc. (Vaccine A and B) , and the other of 8,000 million (Vaccine C), adjusted the injection volumes to 0.5 and 1 cc. of Vaccine A and B and then 1 cc. of Vaccine C, volumes similar to those for the typhoid prophylactic, with doses of 2,000 million, 4,000 million, and 8,000 million cocci to be given at weekly intervals.

At the direction of the Division Surgeon, the. Division Training Officer, Captain Albert Bower, to whom especial thanks is due for his mediation between the regimental surgeons and the laboratory, called a meeting of the surgeons at which the method of giving the vaccine and the results to be expected and observed were fully described and discussed. The surgeons were thus informed of the procedure and object of the vaccination and their cooperation was enlisted, without which little could have been accomplished. The response of the men when the vaccine was offered to them was due in large measure to the

interest and example of the regimental surgeons.

According to the statistics of the division headquarters, the total strength of the 89th Division at this time was approximately 25,000 officers and men. Of the~e, 4,792 (19per cent) took the first injection, 4,257 (17 per cent) the second also, and 3,702 (15 per cent) completed the series.

Part of the men received the full dosage as planned. About half of those vaccinated, whose third injection was due after February 4, 1918, were given a final injection of 4,000 million, on account of the occurrence of several fairly severe reactions from the larger dose among medical officers at Fort Riley. In some regiments the vaccinations had been completed before February 5.

Reactions.--After the first injections had been given, the opinion was almost universal in the camp that the vaccine caused less general and local reaction than the typhoid prophylactic. In very few regiments was a man excused from duty the following day on account of the reaction from the vaccination. The general feeling was that the second dose caused less reaction than the first, but there were a few men in almost every organization who had reactions of moderate severity, sometimes being confined to bed for the day with headache, joint pains, and nausea. Several cases of looseness of the bowels or transient diarrhea were noted. This symptom had not been encountered before. Careful inquiry in individual cases often elicited the information that men who complained of the effects of vaccination were suffering from mild coryza, bronchitis, etc., at the time of injection.

Among the units who took the third injections before the dosage was reduced, and so received a third dose of 8,000 million meningococci, there were several instances of fairly severe reactions, general and local, which necessitated relief from duty the following day. The reactions were not more severe than those that occasionally follow paratyphoid prophylactic and no untoward results were reported. The large majority of the men seem to have suffered no appreciable reaction whatever. The smaller doses of 4,000 million cocci caused even fewer reactions.

As in the preliminary series, the factor of individual susceptibility was prominent, a few officers and men suffering severely from doses which caused no general discomfort in the great majority o'f the men. In general, the more severe reactions occurred among the commissioned officers, and especially among the medical officers at the Base Hospital and in the Medical Officers' Training Camp at Fort Riley, due in part perhaps to more confining occupations, higher nervous tension, and more introspection than was common among the enlisted men. In one regiment, through a misunderstanding, four men were given an initial dose of 8,000 million cocci, which was well tolerated. The surgeon reported:

- "One had chill for 30 minutes, headache for 1 hour, slight local reaction.
- One had slight headache, slight local reaction.
- One had severe local reaction and headache for 24 hours.
- One had slight local reaction, headache for 12 hours."

A survey of the reports of the regimental surgeons and of the observations in the preliminary series shows that headache was the most frequent symptom following injection, and accompanied most of the other symptoms encountered. Sometimes the reaction was initiated by a chill or chilly sensation, and a number of men complained of fever or feverish sensations during the following night. Next in frequency came nausea (occasionally vomiting), dizziness, and general "aches and pains" in the joints and muscles, which in a few instances were especially localized in the neck or lumbar region, causing stiff neck or stiff back. A few injections were followed by diarrhea. The reactions, therefore, occasionally simulated the onset of epidemic meningitis and several vaccinated men were sent as suspects to the Base Hospital for diagnosis.

Such transient reactions are illustrated by the following brief protocols:

- Individual 1.--C. D., Private, Battery D, 342nd Field Artillery.
- Jan. 15, 1918. 1st injection 2,000 million. "Sore arm."
- Jan. 22. 2nd injection 4,000 million. "Sore arm, headache."
- Jan. 29. 3rd injection 8,000 million. "Began to feel badly about 15 minutes later and had a chill. 3 hours later was sent to the Base Hospital complaining of headache, lumbar pain, stiff neck, and fever, 103°F. No nausea. Went to sleep about 2 hours later and slept well. Had entirely recovered the next morning."
- Individual 2.--L. N., Private, Field Hospital Company 354, 314th Sanitary Train.
- Jan. 21, 1918. 1st injection 2,000 million. "Slight local soreness."
- Jan. 28. 2nd injection 4,000 million. "Slight local soreness."
- Feb. 4. 3rd injection 8,000 million. "About an hour and a half after injection, was taken with a severe chill and a subnormal temperature. About 20 minutes later his temperature rose to 103.6°F. and then fell within the next 2 hours to 101°F. Temperature normal the following morning. He complained of no other symptoms."

The most severe illness immediately following vaccination is described by the officer himself as follows:

- Individual 3.--J. M. K., First Lieutenant, 314th Sanitary Train.
- Jan. 21, 1918. 1st injection 2,000 million. 4.30 p.m. Soreness at site of injection in evening. Slept well.
- Jan. 22. Awakened feeling drowsy and listless. Local soreness worse. Pains in back of neck, calves of legs, thighs, lumbar region, and both arms. No appetite. Symptoms grew worse after holding sick call at the Infirmary. Perspired on slight exertion. Felt chilly and warm by turn. Went to quarters and lay in bunk. Soon felt feverish. Developed diarrhea about i1 a.m. Eight movements in 5 hours. Cup of hot chocolate at 1 p.m. Felt nauseated. Vomited six times in next 3 hours. Took sodium bicarbonate, 2 gm. in glass of warm water, promptly vomited. Retained 15 minutes later, and then began to feel better. Felt well next morning but had no appetite. Bowels still loose. Returned to duty. Appetite returned the evening of Jan. 24. Local soreness persisted 3 days.
    - Jan. 22, 9.45 a. m . . . . . Temperature (F) = 98.4 , Pulse = 86
    - 1.15 p. m . . . . . .Temperature (F) = 99.8 , Pulse = 82
    - 3.45 p. m . . . . . .Temperature (F) = 101.0 , Pulse = 92
    - 7.30 p. m . . . . . Temperature (F) = 101.8 , Pulse = 108
    - 10.00 p. m . . . . . Temperature (F) = 100.0 , Pulse = 98
    - Jan. 2.3, 7.25 a. m . . . . . Temperature (F) = 97.8 , Pulse = 98

- Jan. 28. 2nd injection 4,000 million. Local reaction severe. Duration 3 days. General reaction, malaise of 24 hours duration.
- Feb. 4. 3rd injection 8,000 million. Local reaction severe. Duration 4 days. General reaction, nausea, looseness of bowels (not diarrhea), chilliness, but no fever. Muscle soreness severe and general. Appetite absent for 2 days.

The occurrence of such reactions as those described above was rare but they illustrate the importance of the factor of individual susceptibility. The great majority of the men vaccinated were reported to have had no general symptoms, and very few men were confined to quarters after any dose of the vaccine.

Occurrence of Meningitis after Vaccination.--The records of cases of epidemic meningitis in Camp Funston have been followed up to June 4, 1918, thus covering the period that the 89th Division remained in camp. In the interval between January 21 when the vaccination was started in the camp and June 4, 46 cases of meningitis are reported to have entered the Base Hospital at Fort Riley. Of these patients, three had received one, two, or three injections of antimeningitis vaccine. The following data have been collected in regard to these cases.

- Case 1.--L. T., Second Lieutenant, 314th Engineers.
- Jan. 21, 1918. 1st injection 2,000 million. Next day neck was rather stiff. slight headache. Well for next 2 days, but working very hard on double duty.
- Jan. 25. Fainted at Officers' Call. Felt "under the weather" with indefinite symptoms the next 2 days but remained on duty.
- Jan. 28. 2nd injection 4,000 million. This made him feel so much better that he remarked to his friends that he "was getting to,be a dope fiend in the stuff and couldn't get along without it."
- Jan. 29. Felt worse again, headache, "no ambition.': Following days he remained on duty, but tired easily and often felt chilly and feverish, had stiff neck and joint pains.
- Feb. 2. Remained in bed. Throbbing headache, became nauseated and vomited twice. Sent to Base Hospital. Lumbar puncture on arrival showed a turbid fluid with many leukocytes and moderate numbers of intracellular Gram-negative diploeocci.
- Lieutenant T. had a very mild case of meningitis which yielded promptly to serum treatment.
- Case 2.--E. H., Corporal, Company C, 354th Infantry.
- Jan. 21, 1918. 1st injection 2,000 million. "Never felt anything. Arm not very sore."
- Jan. 26. Went on 5 days leave, returning Jan. 31, and so missed second injection.
- Feb. 1. "Felt sore all over." Had chills. Frontal headache.
- Feb. 2. Headache continued, stiff joints and aching pains. Sent to Base Hospital. Diagnosis, epidemic meningitis.
- Corporal H. had a severe case of meningitis but recovered.
- Case 3.--J. C. N., Private, Company B, 340th Machine Gun Battalion.
- Jan. 24, 1918. 1st injection 2,000 million.
- Jan. 31. 2nd injection 4,000 million.
- Feb. 8. 3rd injection 4,000 million. Reactions not reported.
- Mar. 31. Acute otitis media and right frontal sinusitis.
- Apr. 16. Epidemic cerebrospinal meningitis.
- Apr. 24. Cerebrospinal fluid found positive for meningococcus for the last time.
- Apr. 27. Ulcer of right cornea followed by slight opacity with slight impairment of vision.
- May 5. Right facial paralysis which has since improved considerably.
- Private N. will be ready for assignment to domestic military service about July 1, 1918.

The examples of Lieutenant T and Corporal H are instructive, since they may well be, and probably are, instances of meningococcus inoculation in individuals in the incubation period of a meningococcus meningitis, Assuming this to be the fact, the indication is tha~ ne harm was done by the procedure. But whether this is the precise fact or not, the cases have no real bearing on the value of antimeningitis vaccination, because the interval between the first inoculation and the diagnosis of the meningitis was too brief to permit immunization to be effected.

TABLE IV.
Agglutination of Meningococci in Sera of Vaccinated Men. Dilution 1: 2.
[HG005F][GDrive]

It is clear that Private N developed meningitis at a period at which protection following vaccination should have been present. In his case the vaccination must be considered as having failed to afford protection. A study of the type of the infecting meningococcus would conceivably have thrown light on the incident, or the incident may merely indicate that occasional individuals fail to be adequately immunized, just as in the ahalogous procedure of antityphoid inoculation.

Immunity Reactions, General Series.--In addition to the blood samples taken for study in the preliminary series of vaccinations, similar samples were obtained from a group of men in each of three regiments who had completed the vaccination series. The serum specimens were taken at an interval of from 10 to 18 days after the third injections had been given, and were examined for agglutinins by the method already described. The results of these tests are shown in Table IV. The sera of 50 men showed some content of agglutinins; the sera of 16 others failed to do so.

Examination for Agglutinins of the Blood Serum of Chronic Carriers.

While every case of epidemic meningitis is presumed to develop from the carrier state, many observers have noted the rarity of the disease among chronic carriers. The presence of the meningococcus in the nasopharynx is but one of the factors in the accident which results in the bacterial invasion of the body, and the relatively low infectivity of the meningococcus is to be credited to causes of resistance on the part of the carrier host among which may well be the appearance of immune bodies in the blood as the result of the multiplication of meningococci in the nasopharynx.

If the presence of agglutinins for the meningococcus could be demonstrated in the blood of chronic carriers, light would thereby be thrown on the mechanism of this resistance. With the object of detecting the possible existence of meningococcus agglutinins in the blood serum of carriers, a number of such sera have been studied in low dilutions by the capsule method described in an earlier section of this report.

Through the courtesy of Passed Assistant Surgeon J. L. Waterman, United States Naval Hospital, Brooklyn NavyYard, and Dr. F. S.Westmoreland, Riverside Hospital, New York, opportunity was given to obtain blood samples from a number of chronic carriers of the meningococcus, and the corresponding carrier strains were kindly furnished by Dr. A. W. Williams of the Department of Health, of the City of New York, or obtained directly from the men themselves. The men studied were known to have harbored meningococci for from 4 to 16 weeks.

20 carrier strains of the meningococcus have been subjected to the agglutination tests in low dilutions with the sera of the hosts from whom they were obtained and the carrier sera were tested against the stock strains of spinal origin that had been studied in the sera of vaccinated men from Camp Funston. 18 of the carrier strains were also tested with 12 normal sera from supposed non-contacts as controls. The results of these tests are recorded in Tables V to IX. The trials with non-contact sera (Table V) show that with two exceptions the carrier strains are not usually agglutinated in normal sera in a 1 : 2 dilution. One of the exceptional strains was partially or completely agglutinated by 9 and the other by 8 of the 12 sera. The other cultures were only occasionally agglutinated in this low dilution of normal serum. One supposedly normal serum agglutinated 11 of the 18 carrier strains. In the presence of sera from their hosts, however, all but 4 of these carrier strains were agglutinated (Table VI) and the sera in most instances showed agglutinins for stock spinal strains of the meningococcus. Subsequently the sera were reexamined in multiple dilutions, and at this time 2 of those previously found negative agglutinated their strains up to 1:4 and 1:8 (Table VII). The titers of the other sera ran from 1 : 4 to 1 : 64.

TABLE IX.
Agglutination of Stock Strains in Sera of Carriers.
[HG005K][GDrive]

Appearance of Agglutinins in Sera after Storage.--On numerous occasions we have observed an increase in agglutinating power in sera which have stood at ice box temperature for some time. The fact was reported in a recent paper (9) as having occurred with typhoid agglufinins in guinea pig sera, and Tulloch (4) records an instance in rabbit serum during immunization to the meningococcus. This he explains as due to the presence of constituents of the serum or of the organisms which do not take part in the mechanism of agglutination, but which may be present "in such quantity or in such a physical state that they protect the united antibody-antigen complex from the flocculating action of the electrolytes."

Table VIII shows the appearance of agglutinins in some of the sera under discussion after they had stood, sealed, at 4°C. for some time. The other sera were not examined so early after bleeding. The inconstancy of the phenomenon has already been described ° and is implied by Tulloch in his reference to "this particular serum."

A variation of a different order was encountered when ten of the sera studied on May 29 or June 12 were examined on June 24 in multiple dilutions with the stock spinal strains (Table IX). Six of the ten had agglutinated Strain 8 in the 1:2 dilution. Now all but one serum failed to do so. Strains 10 and 60, however, were agglutinated in various serum dilutions by practically all the specimens examined, including No. 43, which had failed to agglutinate its homologous strain. Agglutinins for these spinal strains are only rarely found in normal sera (Table II).

DISCUSSION.

- Heretofore meningococcus vaccines have not been extensively employed for prophylactic immunization, and only a few references are to be found in the literature that relate vaccination experiences. Davis, TM in 1907, describing animal experiments and the therapeutic use of an autogenous vaccine reported a personal experience in which he suffered a very severe reaction following the subcutaneous injection of a 24 hour slant culture of a meningococcus heated to 65°C. for 30 minutes. Shortly after inoculation, nausea and vomiting were followed by a severe chill, lasting half an hour, and then intense headache, muscular pain, purging, and vomiting of bile. His temperature rose to 103°F., and during the remainder of the day, and in the night following, nausea and vomiting continued, with headache, thirst, and marked prostration. Later symptoms included a diffuse rash, herpes, and in the urine granular, hyaline, and epithelial casts. The reaction subsided gradually. The leukocytes rose to 44,050 on the 3rd day, and the opsonic index reached 2.3 on the 2nd day, returning to normal by the 5th day.
- Sophian and Black n studied agglutination and complement fixation in serum specimens from ten students who had been vaccinated with two or three doses of a monovalent vaccine. The doses given were 500 or 1,000 million, 1,000 or 2,000 million, and 2,000 million cocci, at 7 day intervals. Their vaccine had been heated to 50°C. for 1 hour. Following the vaccinations they noted malaise, frontal headache, and slight fever with occasionally more severe symptoms; intense frontal or vertical headache, general bodily pain, nausea, vomiting, and a rise of temperature to 102-104°F. Labial herpes was seen. Using a readily agglutinable organism, they found the agglutinin titers of the sera of their vaccinated subjects to range from 1 : 200 to 1: 1,500. Complement was fixed in serum dilutions up to 1 : 250.12 Complement-fixing antibodies were found in low dilutions of the serum of seven of

these men after an interval of 2 years.

- Sophian and Black refer to Hall's experience in Kansas City in the vaccination of about 280 persons in families in which meningitis had occurred. A number of doctors and nurses were likewise inoculated, and in no instance did the disease occur subsequent to vaccination. About 100 persons in Dallas were vaccinated, but most of them did not complete the vaccination series. Two nurses developed epidemic meningitis some weeks after a series of two inoculations; both recovered.
- Recently Whitmore, Fennel, and Petersen TM have reported an experience with a polyvalent lipovaccine in which total doses of 40,000 million or 80,000 million cocci were given subcutaneously in one or two injections. 55 men in all were vaccinated. 40,000 million cocci in one dose did not cause any general reaction. Two doses of 40,000 million cocci each at a 3 day interval were followed by two instances of constitutional reaction among 25 men. 5 men received 80,000 million cocci in a single injection which was followed after 24 hours by a moderate general reaction. In the first days after vaccination with the larger doses agglutinin formation was observed against three of the vaccine strains, especially those that respond to antibodies of both the normal and the para type.

These reports from the literature coincide with the present experience with meningococcus vaccine in their descriptions of the reactions that may be expected, and of the appearance of specific antibodies in the blood after vaccination. As Sophian and Black pointed out, the general symptoms indicate some degree of meningeal irritation and occasionally they may simulate the onset of meningitis. The symptoms are not progressive, however, and even though severe, they clear up in a few hours. In one instance in which a lumbar puncture was done on a suspect 3 days after a secdnd dose of vaccine the spinal fluid was found normal. The illness described by Davis is instructive to show the severity of the symptoms which may follow an injection of meningococcus substance many times the proper dose. Whitmore, Fennel, and Petersen, by protecting their vaccine in oil, were able to give much larger doses in a single injection with only moderate constitutional effects.

Whatever may be the relation of agglutinins to specific protection against invasion the agglutination test is recognized as the most reliable indication of antibody formation due to the meningococcus, and is used generally in the standardization of therapeutic sera as an index of potency. With equal reason the presence of agglutinins may be taken as an index of active immunization after vaccination. We do not know the ratio of agglutinin formation to protective power, and can only discover by wide experience what agglutinin titers correspond to relatively complete immunity to meningococcus invasion. It is perhaps significant, however, that the agglutinin titers of the sera of vaccinated men are of the same order of serum dilutions, namely 1 : 4 to 1 : 64+, as those of chronic carriers of the meningococcus, who are usually refractory to the strains carried. A study of the blood of cases of meningitis which have recovered without serum treatment might be instructive in this connection.

Meningococcus agglutinins appear not to have been found previously in the blood of chronic carriers. Cathoire, (14) in a brief communication, reported that the agglutinin study of carrier sera led to no positive result, but with the Wright technique he was able to show a constant increase in opsonic power compared with sera from normal persons, and he therefore concluded that the relative immunity of carriers is to be explained by a specific change in the serum.

Herrick (15) thinks that the occurrence of relapses in some cases of epidemic meningitis "lends discouragement to vaccine prophylaxis and other measures for the production of immunity." It should be pointed out that relapses are probably caused by reinfection from small pockets in the meninges in which the meningococcus has been walled off, and so permitted to survive therapeutic measures otherwise effective. It may be mentioned in passing that the occurrence of relapses in typhoid fever has been no contraindication to the employment of typhoid prophylaxis. The object of prophylactic vaccination is to oppose the meningococcus at the threshold, and if a systemic invasion precedes the spinal infection, as recent observations tend to show, the building up of antibodies in the blood stream is the means by which a hematogenous incursion is to be combated.

SUMMARY.

1. A meningococcus vaccine suspended in salt solution has been given subcutaneously as a prophylactic to about 3,700 volunteers in three injections of 2,000 million, 4,000 million, and 4,000 or 8,000 million cocci at weekly intervals.
2. These doses rarely caused more than the mildest local and general reactions. Exceptionally a more severe reaction emphasized the presence of an unusual individual susceptibility to the vaccine. In such instances the symptoms were in part those of meningeal irritation and sometimes simulated the onset of meningitis.
3. Specific meningococcus agglutinins have been demonstrated in the blood serum of vaccinated men as compared with normal controls.
4. Moreover, agglutinins have been demonstrated in the blood serum of chronic carriers of the meningococcus. Evidence is thus brought forward that the relative immunity of chronic carriers to epidemic meningitis may be due to the presence of specific antibodies in the blood stream.

THE PACIFIC COMMERCIAL ADVERTISER, HONOLULU, SATURDAY, DECEMBER 2, 1916.

Territorial Market

SHIPPING FEVER VACCINE IS HERE

To Cure Disease Causing Loss of Kona Cattle and Honolulu Hogs

In his report to the board of agriculture and forestry Dr. V. A. Norgaard states that hemorrhagic septicemia, otherwise known as "shipping fever," has gained quite a foothold in Hawaii. It especially affects young cattle and hogs.

The disease was first observed here about four years ago in a shipment of cattle from Hawaii. At the same time the first reports of its appearance as an epidemic were received from a half dozen of the States.

Worst in Kona

The Kona side of Hawaii is most seriously infected, even though no outbreaks have been reported direct from there. But nearly every case which has come under observation here can be traced more or less directly to Kona. Unusual heavy shipments of cattle have arrived from Kona and a number of them have had dead or dying cattle at the time of arrival, one shipment as high as five head. These deaths cannot be attributed to rough weather or hard handling, although shipping undoubtedly accelerated the development of the disease.

Hogs that have died of the disease here in Honolulu have been among animals fed on slaughter house offal and in practically every case Kona cattle have been among those furnishing the refuse. In hogs the disease takes practically the same form as in cattle—extensive hemorrhages, pleuro-pneumonia and intense bloody inflammation of the intestines.

1916-12-02-the-honolulu-advertiser-pg-2-clip-shipping-fever-vaccine

Symptoms of Infection

Characteristic are the gelatinous exudations under the skin and in both chest and abdominal cavities, as well as the intense bluish-black discoloration of all lymph glands. The disease in hogs corresponds closely to what we used to call swine plague and does undoubtedly appear most frequently and in its most fatal form where the hog cholera infection is present. Had that been the case here the flocks where the disease appeared would undoubtedly have been wiped out in short order.

Medical treatment is of little or no value. An effort to check one of the outbreaks by means of large injections of hog cholera serum gave doubtful results. About thirty head out of more than seventy died, even though but few were affected at the time of treatment. It is, of course, impossible to say how many would have died had this treatment not been resorted to. In a smaller flock, about thirty head, two of the worst ones, were treated similarly. One of these died and one is still alive. Of the remainder, untreated, more than two-thirds are dead and some sick.

This is the disease that almost wiped out the herds of buffalo and elk in Yellowstone National Park, and at the time of that epidemic the federal animal husbandry specialists at Washington developed a vaccine which was effective in controlling the epidemic.

Vaccine Now Here

Doctor Norgaard cabled to the Cutter Laboratories in Berkeley for fifty boxes of the vaccine, which arrived on November 21. This vaccine is prepared for cattle but may possibly prove effective for hogs also. In any case it constitutes the only therapeutic and preventive measure, beyond sanitary and hygienic precautions, which seems to hold out any promise of success. The disease is, however, known to disappear as suddenly as it appears, but the very fact that the organism causing it is, so to speak, ubiquitous, makes all effort at eradication seem more or less futile. It is the only known infectious disease which may originate spontaneously—it does not have to be introduced. The infection is here and everywhere, but it becomes disease producing only under certain obscure circumstances on the disappearance of which the infectious agent again becomes innocuous.

Neither horses, dogs nor poultry is exempt from the disease, but fortunately human beings seem to be immune. It is, therefore, of importance that all poultry be kept away from the hog yards where the disease appears.

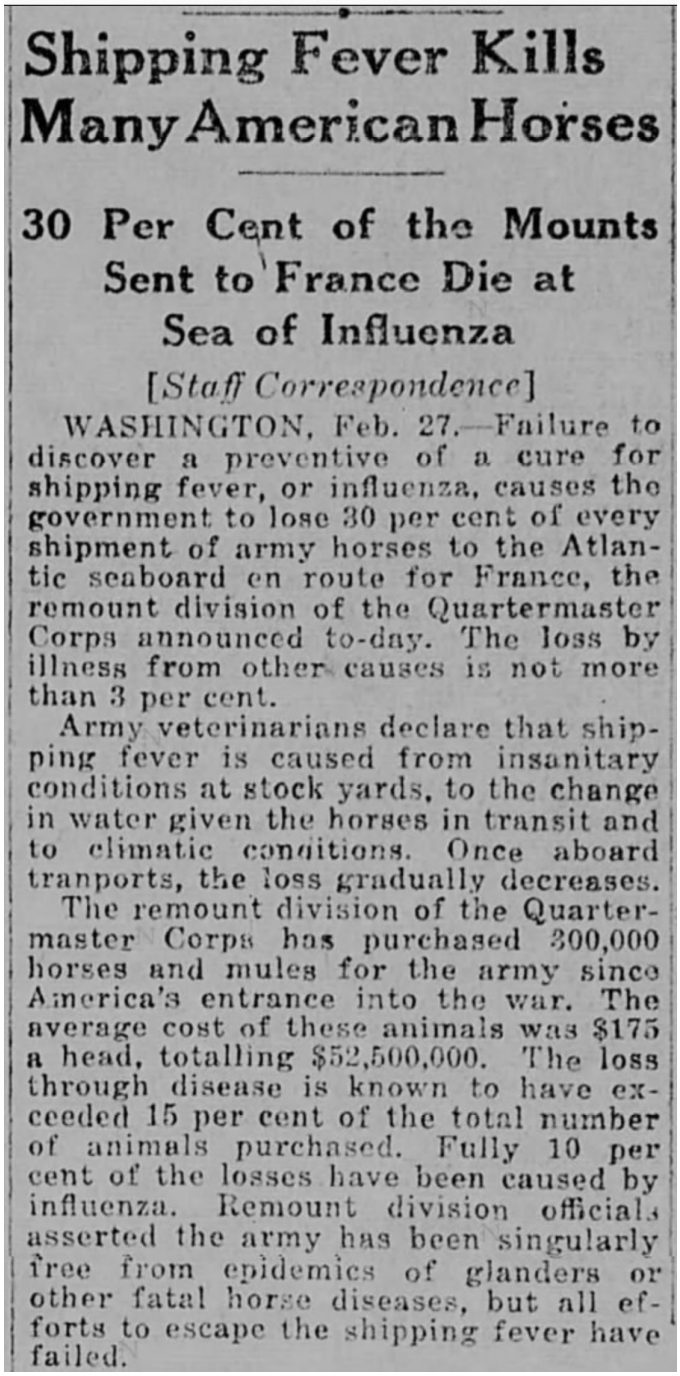
New-York Tribune (New York, New York) • 28 Feb 1918, Thu • Page 4



Shipping Fever Kills Many American Horses

30 Per Cent of the Mounts Sent to France Die at Sea of Influenza

[Staff Correspondence]

WASHINGTON, Feb. 27.—Failure to discover a preventive of a cure for shipping fever, or influenza, causes the government to lose 30 per cent of every shipment of army horses to the Atlantic seaboard en route for France, the remount division of the Quartermaster Corps announced to-day. The loss by illness from other causes is not more than 3 per cent.

Army veterinarians declare that shipping fever is caused from insanitary conditions at stock yards, to the change in water given the horses in transit and to climatic conditions. Once aboard tranports, the loss gradually decreases.

The remount division of the Quartermaster Corps has purchased 300,000 horses and mules for the army since America's entrance into the war. The average cost of these animals was $175 a head, totalling $52,500,000. The loss through disease is known to have exceeded 15 per cent of the total number of animals purchased. Fully 10 per cent of the losses have been caused by influenza. Remount division officials asserted the army has been singularly free from epidemics of glanders or other fatal horse diseases, but all efforts to escape the shipping fever have failed.

Fall River Daily Evening News (Fall River, Massachusetts) · 01 Mar 1918, Fri · Page 5

SHIPPING FEVER KILLS MANY AMERICAN HORSES.

30 Per Cent. of the Mounts Sent to France Die at Sea of Influenza.

Washington, Feb. 28.—Failure to discover a preventive or a cure for shipping fever, or influenza, causes the government to lose 30 per cent. of every shipment of army horses to the Atlantic seaboard en route for France, the remount division of the Quartermaster Corps announced yesterday. The loss by illness from other causes is not more than 3 per cent.

Army veterinarians declare that shipping fever is caused from insanitary conditions at stock yards, to the change in water given the horses in transit, and to climatic conditions. Once aboard transports the loss gradually decreases.

The remount division of the Quartermaster Corps has purchased 300,000 horses and mules for the army since America's entrance into the war. The average cost of these animals was $175 a head, totalling $52,000,000. The loss through disease is known to have exceeded 15 per cent of the total number of animals purchased. Fully 10 per cent of the losses have been caused by influenza. Remount division officials asserted the army has been singularly free from epidemics of glanders or other fatal horse diseases, but all efforts to escape the shipping fever have failed.

The army soon will go into the market for the purchase of sufficient horses to mount the seven regiments of cavalry now being organized at Southern posts. All are to be purchased directly from farmers and breeders. Heretofore 90 per cent. of the animals have been brought from horse dealers because the Quartermaster Corps did not have enough officers to send to individual farms in quest of animals.

The Central States, with Kansas City as the chief army market, furnished most of the 300,000 animals purchased last year by the department. Artillery animals came from the North Central States, chiefly from Iowa and Nebraska. Ninety per cent. of the mules in the army were furnished by Missouri, with Oklahoma and Texas furnishing the remainder.

Grippe!

The attack of grippe is so ferocious that it often makes invalids of strong men and women. The blood is robbed of its richness and redness. Thus the whole body is deprived of its chief means of nourishment and sustenance. Hence it is vitally important that convalescence begin with the blood.

In one European country, the grippe is known as "*Lightning-catarrh.*" There could be no better name to describe the speed with which the grippe germs first attack the air passages, then sweep through the system in a destroying horde, pillaging the blood, ravaging the vital organs, laying waste to health and strength. No form of illness is more acute or exhausting, and the initial attack is followed by debility which often lasts for several months.

Gude's Pepto-Mangan

"The Red Blood Builder"

Will help you to get well

Study this picture so you will know how genuine Pepto-Mangan looks

Friendly Warning

There are many imitations of Pepto-Mangan on the market, but you can be sure of getting the genuine if it bears the name "Gude" and is put up in the bottle and sealed package as pictured here. Ask for it by its full name—"*Gude's Pepto-Mangan.*" For sale at all drug stores.

Whether in the prevention of or convalescence from grippe, the blood must play an important role. The man or woman with rich, red blood stands the best chance to pass immune through an epidemic, because the *germicidal* power of pure, vigorous blood—that is to say, its power to destroy the germs of sickness and thus prevent their gaining a foothold in the system — is very high. And it is only through the systematic upbuilding of the blood that the grippe convalescent can recover from his debility and fully regain his former strength, vitality and working capacity.

To prevent the grippe, or to assist convalescence if you already have had the grippe, make sure of regular exercise, sleep, rest, an abundance of fresh air and a well balanced diet. Also fortify your blood and your body with *Gude's Pepto-Mangan*, "The Red Blood Builder."

Gude's Pepto-Mangan increases the number of the red blood cells and their capacity to rid the blood of poisons and to carry renewed strength — in the form of oxygen—from the lungs to every cell and tissue of the body. *Gude's Pepto-Mangan* is a splendid general tonic and appetizer. It is easily digested and assimilated and exceedingly pleasant to taste. Universally used and prescribed by the medical profession for run-down, bloodless and anemic people of all ages and conditions.

Pepto-Mangan is made only by

Pneumonia Gains In National Army

It Also Increases Among the Regulars; National Guard Luckier

WASHINGTON, March 28.—Although health conditions in general among the troops training in this country are described in this week's report of the division of field sanitation as "very good," deaths among the soldiers increased from 180 the week before to 223. Pneumonia increased in the National Army and regulars, but in the National Guard all epidemic diseases are declining.

Deaths in the regular army last week were 86, as against 71 the week before; in the National Guard, 20, as against 28, and in the National Army, 117, as against 81. Seventy-three of the deaths in the National Army and seven of those in the National Guard were caused by pneumonia.

Only 76 new cases of pneumonia were reported from the National Guard camps, but in the National Army camps 287 new cases of this disease were reported, as against 255 the week before. Mumps and influenza prevail in many National Army camps, and some measles and meningitis are reported.

In the National Guard camps the sick and death rates are described as remarkably low, while in the regulars there are fewer cases of measles, scarlet fever and meningitis. Pneumonia shows an increase among the regulars, particularly in the aviation section and Southern department.

WADSWORTH HAILS LOAN WITH PARADE

Fifty-third Infantry Brigade Marches Through Streets of Spartanburg.

CAMP'S SICK RATE JUMPS.

Influenza Epidemic Reduces Ratio of Effectives.

(Special to The Standard Union.)

CAMP WADSWORTH, Spartanburg, S. C., April 6.—The Fifty-third Infantry Brigade opened the Liberty Loan campaign to-day with a parade in Spartanburg. Besides the 107th and 108th Regiments of Infantry, the 106th Machine Gun Battalion and two ambulance corps took part.

The parade was reviewed by Major General O'Ryan and Brig. General Guy Carleton and their staffs.

The sick rate in camp took another jump during the week, due to an epidemic of influenza. The reports show 24.6 non-effectives per thousand for the week as against 22.7 per thousand for last week.

A provisional regiment, to be composed of all the machine gun units of the Twenty-seventh Division, under the command of Major Edward McLeer, divisional machine gun officer, will go to the rifle range at Glassy Rock next Tuesday for a course of instruction. The provisional regiment will march to the range and back.

The following promotions were announced to-day at division headquarters: Battalion Sergeant Major John A. McPike, of the 105th Machine Gun Battalion, to be second lieutenant, quartermaster corps, and ordered to Newport News, Va., for assignment to duty; Major Robert P. Wadhams, Medical Corps, to be Lieut. Colonel and assigned to command the 102d sanitary train, and Capt. Frank W. Sears, Medical Corps, assigned to the 102d ammunition train.

Three colonels reported to-day to Brig.-Gen. Guy Carleton, commanding the Provisional Depot for Corps and Army Troops. The colonels came here from the field officers' school at San Antonio. They were rendered surplus when the National Guard divisions were reorganized, and have been sent here for duty with the depot. As there are no vacancies at present, they have been temporarily attached to pioneer infantry regiments. The new colonels are Col. William A. Raupp, formerly of the Second Missouri Infantry, attached to the Fifty-sixth Pioneer Infantry; Col. Leroy K. Robbins, formerly of the Fifth Missouri, attached to the Fifty-fifth Pioneer Infantry, and Col. Maurice E. Finney, formerly of the Eighth Pioneer Infantry, attached to the Third Pioneer Infantry.

Three hundred men of the Medical Department arrived here to-day from Fort Oglethorpe, Ga. They were assigned to the sanitary detachments of the Pioneer Infantry regiments and the Anti-Aircraft Machine Gun Battalion. The Second and Fifty-third Pioneer Infantry regiments each received forty of the men and now have a full complement of men in their sanitary detachments. The new men are Regular Army and National Army men and have received training at the medical school at Fort Oglethorpe.

Week's Deaths in Home Camps 290, a Decrease

Influenza and Mumps Comprise Chief Hospital Cases

WASHINGTON, April 11. — Health conditions throughout the army at home continue satisfactory, says the weekly report issued to-day by the War Department, although the hospital admission rate increased over the preceding week.

Influenza and mumps are the chief diseases noted, the latter frequently complicated with pneumonia, accounting for the rising admission rate. Ailments among drafted men contracted before they entered camp have swelled the sick rates. The total number of deaths for the week ending April 5 was 290, against 237 the preceding week.

The Great Increase In Army Horses

Breeders' Gazette: In ten months since war was declared the number of horses and mules in the United States Army has been increased from an original 66,145 to more than 350,000. Incidental to the purchase and care of so many animals, it has been necessary to build up a great system of officers, veterinarians and men to buy and handle horses. At the onset of hostilities the remount service had one officer and four clerks in Washington and a few purchasing agents. There were five remount depots. Its present strength is 300 officers and 11,000 enlisted men, and it has provided a total of thirty-four remount depots, with shelters, hospitals, storage houses and other equipment. The veterinary force has been increased from an original group of sixty-four officers and no enlisted men to the present organization of 1000 officers and 12,000 men, recruited from those without military experience. This construction of organization, system and equipment represents a gigantic task.

In handling so many horses there is a large unavoidable number of disabilities and deaths. The worst trouble is influenza or shipping fever. During the war the British have lost about 10 per cent of the horses purchased in this country, counting only those that died here. The French and Italian losses have been greater. None of the veterinarians has found a satisfactory way to deal with influenza. Medical treatment and vaccination are unreliable. The principal results are secured from sanitary measures and provisions for the care and comfort of the horses. Of course, these healthful conditions are difficult to secure in crowded and hastily provided quarters. During December and January the deaths of horses averaged weekly about 3 per 1000 head on hand. Steady improvement was noted and the deaths steadily declined from 5 per 1000 to about 2 per 1000 head. Even at that, during the six weeks ending January 12 the losses were 4777 head of horses and mules, valued at $835,975.

The steady improvement in the health of the horses is ascribed to the completion of quarters, the experience of officers and men, the increasing veterinary supplies, the establishment of hospitals at railroad centers, the prevention of infection so far as possible by sanitary measures, and the co-operation of other authorities in disinfecting cars and stockyards. With so many trained minds bent upon the successful management of horses under crowded conditions, it is probable that some improvement will be worked out in present methods of dealing with shipping fever. This disease has done more than all else to injure the horse business in America.

INFLUENZA IN ARMY.

WASHINGTON, Apr. 24—The influx of new men to the army training camps in this country resulted in an increased rate of admission to hospitals last week, today's report to the division of field sanitation shows. Epidemics of influenza prevail in national guard camps in the south, as well as national army camps, and as a result pneumonia continues with a high incidence, although the number of new cases is lower than the week before.

1918 (June 22) - Spanish flu impacting German Army

Full page - [HN00WO][GDrive]

Spanish Influenza Is Raging in the German Army; Grip and Typhus Also Prevalent Among Soldiers

LONDON, June 26. Influenza is now epidemic all along the German front, according to advices received from the Dutch frontier, and the prevalence of this ailment is said to be hampering the preparations for offensive operations.

The proportion of men sent to hospitals on account of influenza has risen rapidly in all the German units in the last few days, and special hospitals are being established in the rear areas dealing solely with this disease.

Thus far only the more serious cases have been sent to the hospitals, but the German army doctors say that, unless even the light cases are removed from the units, it will be difficult to prevent further spread of the epidemic.

The disease prevalent in the German Army is reported to be of the new Spanish type, which recently broke out in Berlin and other German cities, and is presumed to have been brought to the trenches by men returning from leave.

In the German cities the disease has been very hard to deal with owing to the shortage of doctors and the conditions of undernutrition among the city populations.

WITH THE BRITISH ARMY IN FRANCE, June 26. (Associated Press.) German troops on the western front are suffering from an epidemic of grip, which incapacitates them for a week or ten days. There are also many cases of typhus and dysentery within the German lines southwest of Lille.

There is no evidence, however, that these illnesses are responsible for the delay of the new offensive. It is believed that the German High Command has nearly completed its preparations for the next great attack against the allied front.

[The prevalence of influenza and dysentery among the German troops on the western front was reported by Philip Gibbs in THE TIMES of Tuesday last.]

KING ALFONSO IS ILL WITH PLAGUE

Mysterious Disease Resembling Influenza Has Affected 40 Per Cent. of Spain's Population.

Madrid, May 28.—A mysterious plague is sweeping Spain. It is estimated that 40 per cent of the population is affected. The disease resembles influenza. So far there have been no known fatalities, but the greatest alarm is felt.

King Alfonso is confined to his bed and it is feared he is a victim of the plague. The premier and the ministers of finance, education and marine, and the under foreign secretary are also suffering from the disease.

Many business places have been forced to shut down. The minister of war suspended the military maneuvers scheduled for this time.

MYSTERIOUS DISEASE SWEEPS NORTH CHINA

PEKING, China, June 1.—A mysterious disease, in some respects resembling influenza, is epidemic in North China and threatens to sweep over the entire Republic. Thousands of cases have been reported here, while in Tientsin there are said to be 20,000 persons ill of it.

Banks and silk houses have been closed down and many policemen stricken with it, are unable to work. So far no fatalities have been reported. The disease appears to run its course in four or five days.

A training camp for medical officers was established at Fort Riley, Kansas, June 1, 1917. It was one of three such camps created by the Army to provide military training for civilian doctors who were in the Army Reserves. The other camps were located at Fort Oglethorpe in Georgia, and Fort Benjamin in Indiana. The three month course provided officers with basic training and specialized instruction in epidemiology, the handling of evacuation hospitals, hospital trains, and ambulance companies.

"Tony's Lab"

Germ Warfare in WWI Used on Horses in the U.S.

Fall 2017, Vol. 49, No. 3

By David Pfeiffer

Enlarge

A shipment of horses at a New York City rail yard, 1918. (165-WW-280A-050)

On a chilly November night in 1915, a dockhand crept silently through the darkness near the Newport News, Virginia, shipyard as he approached dockside corrals filled with horses destined to board British or French transport ships headed for Europe to aid in the Allied war effort.

As he neared the Breeze Point wharf, he carried a brown paper package and rubber gloves. He snapped on the gloves and removed from the package two glass syringes containing a yellow liquid.

The dockhand, a stevedore named John Grant, checked out the hundreds of horses and mules in the British remount depot. Taking care to avoid the night watchmen, he went to the first mule corral. Then he jabbed the needles into the hides of as many mules that he could reach. After jabbing many horses in two pens, he dumped the rest of the liquid in the animal's water basins and food troughs and threw the gloves and syringes into the river.

During 1915–1916, thousands of horses and mules were killed in these horse pens. The yellow liquid, which carried the glanders bacteria, had been cooked

up in what was known as “Tony’s Lab” by an American-born German agent named Anton Dilger.

German espionage and sabotage in the United States was going on long before the United States formally entered the war in April 1917. Dilger’s work was just one of many ways the Germans sought to undermine America’s ability to aid its allies. Fewer horses and mules would make moving artillery and other war materiel much more difficult; it had become a strategic priority for Germany.

Anton Dilger’s Early Life Spent Around Horses, Riding

Enlarge

Anton Dilger’s passport photo, attached to his 1916 application. (National Archives, RG 76)

Dilger was born on a horse farm, named Greenfield, near Front Royal, Virginia, on February 13, 1884. He was the son of Hubert Dilger, a German immigrant and a U.S. Army captain who had received the Medal of Honor for his service as a horse artillery officer at the Battle of Chancellorsville in the spring of 1863.

Hubert Dilger, an expert horseman, was instrumental in saving Union forces in the fighting retreat of General Hooker’s troops during Confederate General Stonewall Jackson’s flank attack at the end of the battle. The Confederates won the battle but did not destroy Hooker’s army, due partly to the efforts of Captain Dilger.

At Greenfield, Anton was taught to ride and to hunt and fish. He was also well acquainted with German culture. Four of his sisters married Germans and moved back to Germany. As a boy, Anton idolized his famous great grandfather on his mother’s side, Dr. Freidrich Tiedemann, known as the “great physiologist of Heidelberg.”

Anton’s grandfather was also a German medical doctor, so, unsurprisingly, Anton was sent, at the age of nine, to study in Germany. He stayed at his sister Edna’s house in Mannheim and enjoyed a comfortable life in Germany.

He passed the medical exam at the University of Heidelberg in 1908 and by 1909 was an assistant at the university surgical clinic while researching his doctoral dissertation. While studying microbiology and germ culture, he learned how to set up a tissue-culture lab. Ironically one of his challenges was how to prevent bacterial infections in animal tissue cultures. Later, in Washington, D.C., he applied his expertise for the opposite purpose.

German Government Shows Interest in Dilger as Agent

Dilger received his doctoral degree in 1912, a year after Hubert Dilger died. Greenfield farm was in decline, and the family sold off part of the farm to the U.S. government. During the years before World War I, it became part of a U.S. Army Remount Depot, where the Army gathered, evaluated, and trained warhorses.

The young and handsome Doctor Dilger cemented his reputation back in Germany as a superb surgeon and a ladies man. Once war arrived, Dilger served in military hospitals performing battlefield surgery in Serbia and Bulgaria in 1914 and in Rastatt, Germany, in 1915. Seeing family members wounded and killed in the conflict hastened his conversion to a pro-German and anti-Allied outlook.

As a German patriot in possession of a U.S. passport, he was a prime candidate for recruitment by German intelligence to work in America.

According to German records, Dilger left Germany on September 29, 1915, working with the Imperial Prussian War Ministry in America.

Officially neutral, the United States provided loans and other goods and supplies to the Allies. Because America supplied hundreds of thousands of horses and mules to the war effort, the Prussian Imperial War Ministry was very interested in cutting off this supply.

Dilger, Brother, and Sister Leave Farm for Chevy Chase

Anton boarded the Dutch passenger liner *Noordam* in Amsterdam, bound for New York City and heading toward his final destination of Washington, D.C. Among the items he carried was a small briefcase filled with fragile glass test tubes that contained the basis for manufacturing the glanders germ. The glanders bacteria was a primary killer of horses and mules.

With the help of his sister Jo, who lived with her family in northwest Washington, D.C., he searched for a rental house where he could establish a physician’s office and set up a small laboratory for his experiments. He hung up his shingle but never saw any patients.

During a visit to Greenfield in December 1915, Anton persuaded his sister Em and his brother Carl to join him in Washington. He asked Em to be the housekeeper and Carl, a former beer brewer, to help in the lab. More importantly to Anton, she could be hostess and consequently discourage any possible gossip. Em had no idea that her brother was a German agent.

Carl had had his own brewery in Montana and knew how to propagate yeast and ferment vats of beer, a useful skill when it came to cooking up cultures. After Anton confided in him the nature of his mission, Carl was eager to help.

Anton settled in a two-story white brick house in the 5500 block of 33rd Street, NW, near Connecticut Avenue, not far from Chevy Chase Circle. Even in those days, Chevy Chase was a fast-growing and fashionable neighborhood, only six miles from the White House.

There was even a tramline connecting Chevy Chase with downtown. Because Chevy Chase was a new neighborhood with lots of strangers, Anton could easily blend in. Most important, the house had a spacious basement with a separate entrance that Anton could turn into a secret lab. It was a case of hiding in plain sight.

Anton Sets Up “Tony’s Lab”

Anton and Carl bought lab equipment and wire cages for the guinea pigs they would use to test the effectiveness of the poison they were to manufacture

Anton and Carl bought lab equipment and wire cages for the guinea pigs they would use to test the effectiveness of the poison they were to manufacture. They had an incubation oven, sterilizing machine, petri dishes and rows of glass vials. Later, Anton's associates would call the basement "Tony's Lab."

Enlarge

A poisoned horse at Covington, Kentucky. (111-SC-6991)

For several months, the brothers incubated vials of anthrax and glanders. They were careful not to touch the cultures, since the bacteria in the cultures could also kill men. At room temperature, the cultures would be effective for about a month.

When the cultures were ready to go, German agents (Abeteilung IIB) from Baltimore stopped by the house each week to pick them up. These German agents then delivered the cultures to ports on the East Coast, including Newport News, Norfolk, Baltimore and New York, where hired stevedores would secretly inject the animals or contaminate their food supplies with the deadly germs.

The German agent who picked up the cultures at the little house on 33rd Street was Capt. Frederick Hinsch, one of the leaders of the Baltimore group of German agents. To demonstrate the effectiveness of the cultures, Anton showed him the guinea pigs; they were listless and dying. Hinsch was satisfied. In exchange for the cultures, Hinsch handed over a few thousand dollars to cover expenses, such as equipment, glassware purchases, house rental, and salaries for both Anton and Carl. The money came from Paul Hilken, the Baltimore paymaster.

The Baltimore group worked out of the offices of the North German Lloyd steamship line. Hinsch was charged with organizing dockhands, German sailors, and others for sabotage operations such as planting cigar bombs in U.S. ships carrying munitions, distributing flyers to get dockworkers to strike, and poisoning horses and mules being shipped to the Allies.

This was not the first German attempt at killing American horses. Agents earlier attempted to bomb or derail trains packed with horses or mules headed for British remount depots such as Newport News. In January 1915, the Germans planned to bomb transport trains in Canada that carried ammunition as well as warhorses. As it turned out, the cold Canadian winter made it difficult to lay the explosives.

New York City Police Increase Guards on Horses

Enlarge

Anton Dilger applied for a U.S. passport for his return to Germany in 1916. (National Archives, RG 76)

Enlarge

A letter recommendating that Anton Dilger be granted a passport. (National Archives, RG 76)

After another plan to bomb trains heading out of the Chicago stockyards went awry, the Germans turned to germ warfare as a more efficient method to stem the supply of horses and mules heading to the Allies.

An attempt at germ warfare in May 1915 did not work because the saboteur, Erik von Steinmetz, did not know enough microbiology to keep the cultures alive. It became evident to the German General Staff that they had to have an agent who knew bacteriology and knew what he was doing. That agent was Dr. Anton Dilger.

The Dilgers continued to operate their lab until January 29, 1916, when Anton suddenly returned to Germany using a new U.S. passport he had obtained so he could, as he told the Department of State, work as a doctor in Heidelberg. He had also gotten a letter of recommendation from an acquaintance in the U.S. Army Medical Corps.

What had happened?

Capt. Tom Tunney was a New York City police detective and head of the department's bomb squad assigned to investigate and apprehend the culprits in the bombing of buildings and ships in New York harbor. In the winter of 1915–1916, he gathered information concerning Steinmetz's attempted germ attack and wondered if the Germans were going to make another attempt. He had no suspects and no clues—nothing but the fear of another attack.

Captain Tunney ordered doubling the guards at the New York horse corrals and spread the word along the waterfront to be on the lookout for enemy agents who might attempt to poison the animals. He later found out that his vigilance succeeded in preventing a large-scale biological attack.

At a secret meeting in late January 1916, Hilken, being somewhat cautious, told Hinsch and Dilger that "They're on to us." He had learned from Paul Koenig, a German agent in the New York area, that New York police were asking questions around the harbor about plots to poison horses awaiting shipment to the Allies. There were also more guards around the horse corrals. At the meeting, Dilger was handed a cable that ordered him back to Berlin "for discussions." Anton had gotten his wish to get back to Germany, and Dilger's lab had succeeded in remaining undetected.

U.S. Agents Interview Anton, Deem Him Not a Traitor

After Anton left, Carl Dilger continued the work of the lab with Fred Herrmann, a good friend of Anton's, who had been living at the house. They added the manufacture of incendiary pencils and other explosives to their repertoire. Some of these incendiaries ended up being used in the Black Tom explosion in New Jersey, a munitions factory that supplied ammunition to the Allies

Because Carl tended to brag about his mission after having more than a couple of beers at the local taverns, Hilken and Hinsch pushed him out of the operation in May 1916. They sent him to Berlin with an important sealed message to the Political Section of the General Staff. The message was to keep Carl in Germany so that he could not undermine the sabotage operation in America, but the message was lost, and Carl continued in service delivering incendiary tubes. Herrman stayed on at the lab.

After the Black Tom explosion in July 1916 and the increased law enforcement scrutiny that followed, Herrmann decided to close up the lab and move to St. Louis. The St. Louis operation failed since Herrmann did not have Anton's medical and scientific knowledge, and the germ cultures died.

Enlarge

The Black Tom munitions depot in New Jersey was a prime target for saboteurs. Germany was eventually held accountable for the devastating explosion there. (111-SC-95793)

Amazingly, it was the local police, like Captain Tunney in New York, not the national law enforcement entities such as the Bureau of Investigation, the Secret Service, and Military Intelligence, that were most effective against German sabotage operations. Bureaucratic inefficiencies, lack of law enforcement authority, and lack of staff contributed to their failure.

For example, an agent of the Bureau of Investigation interviewed Anton Dilger in July 1917 while he was visiting one of his brothers at Greenfield. He had come to America to deliver secret coded messages from Berlin to German agents and diplomats. Later in July, he was interviewed again by another bureau agent while he was staying at his sister Jo's house in Washington. Again, this interview did not raise any red flags, the agent saying in his report that "Dr. Dilger is not a man who would be guilty of any traitorous acts towards this country." Anton Dilger had slipped through the bureau's fingers.

Anton Receives Iron Cross for His Service to Germany

Anton then went to Mexico to join with the other Baltimore-based agents, specifically Hinsch and Hilken, who had escaped the United States after the declaration of war in April 1917. Taking on the alias "Dr. Delmar," Anton's main mission from Berlin was to promote a Mexican invasion of the United States, and he raised money to finance the proposed campaign. Feuding among Anton, the German agents, and Berlin caused the campaign to fizzle, but Anton was still awarded the Iron Cross in January 1918 in recognition of his sabotage and espionage work.

Enlarge

Carl Dilger applied for a passport in 1916 to allow him to travel to Germany. (National Archives, RG 76)

Even so, Anton had made enemies both in Mexico and Berlin. Now in Spain, he feared that Allied investigators were finally catching up to him. Then came the Spanish influenza epidemic of 1918–1919, which killed possibly as many as 50 million people worldwide. On October 17, 1918, Anton Dilger died of influenza in Madrid at the age of 34. That was the official story. Ironically, he was a germ saboteur killed by an infectious disease.

There were problems with this version of events. Carl Dilger and Fred Herrmann later claimed that they suspected German agents had murdered Anton—that he had been poisoned "because he knew too much." In testimony years later to the Mixed Claims Commission, they alleged that Anton's cover had been blown and Allied agents were closing in. There is still some doubt whether Anton even died in Madrid in 1918. The details of his death remain murky to this day.

The Mixed Claims Commission, U.S. and Germany, was established in 1922 for the purpose of satisfying claims of the United States and its citizens against Germany since 1914. By 1933, most of the claims had been settled. The largest group of unsettled claims were the sabotage claims, which consisted of the 153 claims of U.S. citizens who suffered losses as a result of German sabotage in 1916–1917. The sabotage claims remained before the commission for more than 12 years, and due to German intransigence, it was not until 1939 that a decision was rendered in favor of the U.S. claimants.

According to later estimates, the German germ sabotage campaign in America killed thousands of horses during World War I. Even so, that number was not a significant factor in the war effort since more than over 750,000 horses were shipped to the Allies from America. This was the first modern germ warfare campaign in history. But it was not the last.

The story of Anton Dilger and "Tony's Lab" are filled with ironies. But the most notable one is that an American-born son of a Civil War hero, who loved horses and was an expert horseman, became a German agent whose germ cultures were responsible for the deaths of thousands of horses in the United States during World War I.

David A. Pfeiffer retired earlier this year after 40 years as an archivist at the National Archives, specializing in transportation and diplomatic records. Over the years, he has written a number of articles for *Prologue*, including the award-winning "Bridging the Mississippi: The Railroads and Steamboats Clash at the Rock Island Bridge" in Summer 2004. He holds a bachelor's degree from Ithaca College and a master's degree from George Mason University, both in history.

Note on Sources

The main primary source that I consulted was the records of the Mixed Claims Commission, United States and Germany, 1922–1941. The records are part of Record Group 76: Records of Boundary and Claims Commissions and Arbitrations housed at the National Archives at College Park in Maryland. The MCC records include a tremendous amount of information on the sabotage claims cases and their eventual settlement. The record series consulted for this article were the Records Relating to German Saboteurs and Their Activities, Chronological List of German Sabotage Activities, 1893–1927 (Entry 73), which has a great chronology of the surveillance of German agents, and the Records Relating to German Saboteurs (Entry 76). There are files on Anton and Carl Dilger, Frederick Herrmann, Paul Hilken, and Frederick Hinsch, and others. I also briefly checked the Testimony of Frederick L Herrmann and Theodore J. Wozniak, 1930 (Entry 79) and Testimony in Sabotage Cases, 1930 (Entry 82).

There are two agent reports on interviews with Anton Dilger during July 1917 in the Records of the Federal Bureau of Investigation (Record Group 65), Investigative Cases Files of the Bureau, 1908–1922 (Microfilm Publication M1085), Old German Files #33415 and #26601. These records are also at the National Archives at College Park.

My main secondary source was *The Fourth Horseman: One Man's Mission to Wage the Great War in America*, by Robert Koenig. This is the definitive work on Anton Dilger, and the author pieced together a great story of Dilger and World War I German sabotage. As he mentioned in his note to sources, there are many gaps in the records and his personal letters. And espionage is not usually well documented.

Other books consulted include the classic on German espionage, particularly Black Tom and Kingsland, by Jules Witcover titled *Sabotage at Black Tom: Imperial Germany's Secret War in America, 1914–1917*. See also *The Secret War on the United States in 1915: A Tale of Sabotage, Labor Unrest and Border Troubles*, by Heribert von Feilistzsch; *The Detonators: The Secret Plot to Destroy America and an Epic Hunt for Justice*, by Chad Millman; and the *Dark Invasion, 1915, Germany's Secret War and the Hunt for the First Terrorist Cell in America*, by Howard Blum. There is also a very good post in the WETA Boundary Stones blog, by Mark Jones titled "'Tony's Lab' and World War I Germ Sabotage in Washington."

I also consulted a book review on the *Fourth Horseman* by Jack Woodall titled "Bioterror Is Nothing New." And finally, I looked at a piece by Sarah McCammon

of NPR on April 6, 2017, called "The Unsung Equestrian Heroes of World War I and the Plot to Poison Them" (*www.npr.org/2017/04/06/522594344/the-unsung-equestrian-heroes-of-world-war-i-and-the-plot-to-poison-them*)

False claim: the 1918 influenza pandemic was caused by vaccines

6 Min Read

Shared 582 times as of March 31, 2020, a 2018 post (here) on a page called "Stop Mandatory Vaccination" claims that "the 1918 Influenza Epidemic was a Vaccine-caused Disease." This claim is false.

The claim that the influenza pandemic of 1918 "was the after-effect of the massive nation-wide vaccine campaign" is unfounded. A vaccine against the flu did not exist at the time. According to the Centers for Disease Control and Prevention (CDC), having "no vaccine to protect against influenza infection and no antibiotics to treat secondary bacterial infections that can be associated with influenza infections" meant that "control efforts worldwide were limited to non-pharmaceutical interventions, such as isolation, quarantine, good personal hygiene, use of disinfectants, and limitations of public gatherings, which were applied unevenly." (here)

According to the CDC report "Achievements in Public Health, 1900-1999," prior to 1900, the vaccines for smallpox, rabies, typhoid, cholera and plague had been developed in the U.S. (see Table 1 here). The report states that "although the first vaccine against smallpox was developed in 1796, greater than 100 years later its use had not been widespread enough to fully control the disease… Four other vaccines -- against rabies, typhoid, cholera, and plague -- had been developed late in the 19th century but were not used widely by 1900."

It is true that U.S. soldiers during World War I were subject to immunization requirements. However, it is not true, as the post claims, that this was the first major conflict in which this happened. Published by the National Institute of Health (NIH)'s National Center for Biotechnology Information (NCBI) in 2018, a paper (here) called "The US Military Commitment to Vaccine Development: A Century of Successes and Challenges," says that "the first large-scale smallpox infection prevention campaign was conducted in 1777 by the Continental Army."

In addition, a 2006 paper called "Immunization to Protect the US Armed Forces: Heritage, Current Practice, and Prospects," published here by the Bloomberg School of Public Health at Johns Hopkins University, says that American servicemen underwent some version of smallpox immunization in the American Revolutionary War (1775-1783), the War of 1812, the Mexican-American War (1846-1848), the Civil War (1861-1865), and the Spanish-American War (1898). (See Table 2: "Immunizations used widely during major conflicts") During World War I, soldiers were given live smallpox and whole cell typhoid inoculations, as well as therapeutic tetanus and diphtheria antitoxins. "With a vaccine to shield troops from typhoid bacteria during the unsanitary conditions of World War I," the paper says, "a mere approximately 2,000 cases of typhoid fever, with 227 deaths, were reported among 4.1 million Americans in uniform.

Killing an estimated 675,000 Americans (virus.stanford.edu/uda/), the 1918 H1N1 flu pandemic (also referred to as the "Spanish Influenza" or "Spanish flu") was indeed the deadliest flu pandemic in modern history (here).

The outbreak of the "Spanish flu" was recorded in Spain in May 1918, several months before the November 11, 1918 armistice ending WWI. In the U.S., "it was first identified in military personnel in spring 1918" and that "crowded conditions and the movement of troops during World War I likely contributed to the spread of the 1918 virus around the world," according to the CDC (here , here).

The specific origins of the "Spanish flu" outbreak are unknown, but it is known to have been an H1N1 Influenza "with genes of avian origins" (here). In terms of geography, "France, China and Britain have all been suggested as the potential birthplace of the virus, as has the United States" according to the history channel (here).

Finally, the claim that "more of our men were being killed by medical shots than by enemy shots from guns" is unsubstantiated. There is no evidence to show any vaccine killed more men than "enemy shots from guns". According to a paper called "The U.S. Military and the Influenza Pandemic of 1918–1919," by the NCBI in 2010, it was "influenza and pneumonia [that] killed more American soldiers and sailors during the war than did enemy weapons." (here) The U.S. did not develop the first influenza vaccine until the 1940s (here) and the first pneumonia vaccine until 1977 (here).

THE ROCKEFELLER INSTITUTE FOR MEDICAL RESEARCH

BUILDINGS AND EQUIPMENT - NEW YORK CITY

THE principal laboratory buildings of the Institute are situated on the cliff overlooking the East River, at the end of East 66th Street, New York City. The situation insures excellent light and air, and greater quiet than would be enjoyed in the more accessible and crowded central parts of the city. The central structure, the first erected (in 1905-06) (see frontispiece) is a laboratory and administration building with five floors and a light basement, and has a series of accessory rooms on the roof. It covers a ground area of 136 feet by 60 feet. Another laboratory building, containing six floors. and two basements and covering 150 feet by 62 feet of ground, shown at the left of the frontispiece, was opened in 1916. In both buildings each floor is arranged with laboratories and offices about a central corridor. The construction of both buildings is fire-proof and such , that all interior partitions can be altered or removed as occasion requires. Hot and cold water, steam, compressed air, suction, gas, and electric current are supplied to the laboratories. Refrigeration by means of a brine circulation is carried to central positions in the buildings and several large thermostats are a part of the construction. Pipes and drains, vents, and conduits, are exposed or carried through accessible ducts wherever possible, to facilitate inspection and alteration.

In addition to the laboratories these buildings provide administrative offices, an assembly room, library, publication division, a central supply room, illustration division, x-ray division, and facilities for section making, sterilization, and the making of culture media.

The animal house is an eastward extension of the new laboratory building. In it are kept small animals, such as rabbits, guinea pigs, monkeys, etc. There is also provision for ten horses and a smaller number of goats and sheep. Two cold rooms are arranged for aquaria. The building includes arrangements for the storage and preparation of foods, the repair and sterilization of cages, and the incineration of refuse. Walls and floors are finished so that they can be washed down with a hose. The cages are suspended on metal racks instead of being placed on the floor.

The hospital (see frontispiece) is a seven-story building, with two additional basement floors in the wall of the East River cliff, and a roof-house. It is connected by a covered bridge at the level of the third floor with a two-story and basement isolation pavilion, and with the laboratory building beyond. The first floor of the hospital provides for the administration and reception rooms, and for the quarters of the resident staff. The second floor is entirely occupied by the nurses' quarters. The third floor contains a number of small rooms for the accommodation of one or two patients each. The fourth, fifth, and half of the sixth floors are arranged for ward patients. The hospital is planned with the idea of enabling the staff and nurses to give an unusual amount of attention to each of a small number of patients. The general wards are for only six or eight beds each. The balconies at each end of the building are large enough to permit all the beds t0 be rolled out in pleasant weather. The seventh floor of the hospital and. half of the sixth are devoted to laboratories.

It is the policy of the hospital to engage each member of the staff in both clinical and laboratory work, and to provide ample laboratory facilities as near the wards as possible. On the roof is a small operating suite. On this floor also is a sun room for patients.

A power house built and operated by the Institute provides the buildings with heat, light, electric power, pressure, refrigeration, vacuum, and filtered water. It has reserve capacity for future buildings.

BUILDINGS NEAR PRINCETON, NEW JERSEY

[...]

WAR ACTIVITIES OF THE INSTITUTE

THE Institute was created to conduct, assist, and encourage research. It has left largely to other agencies the task of carrying into effect, on an extensive scale, discoveries and methods of immediate practical utility made and developed by its staff. But for the period of the belligerency of the United States the activities of the Institute were chiefly diverted to the service of our own nation and the other allied nations in their common struggle against the Central Powers.

Fortunately the Institute had made contributions looking toward the prevention and the curative treatment of disease which offered immediate application to the medical problems likely to arise in connection with the greatly enlarged personnel of the United States Army and Navy. For example, curative serums for epidemic meningitis and for one of the forms of pneumonia had been worked out here. Moreover, under the support of the Rockefeller Foundation, one of its members, Dr. Alexis Carrel, in conjunction with Dr. H. D. Dakin, had perfected at Compiegne, France, in the early period of the war, a method of treating infected surgical wounds, which had come to have wide applicability in practice. That important medical and allied problems would arise and call for investigation was also patent. The several laboratories of the Institute were so equipped in men and materials as to enable it to supplement the various research and otlJ.er laboratories at the command of the Government. All these resources were placed at the disposal of the Surgeon General and other governmental agencies, and were freely used by them during the war.

The war activities of the_ Institute may be divided into three classes: first, the establishment of teaching courses in the surgical treatment of wounds, in bacteriology, specific treatment of pneumonia, cardiography,. clinical chemistry, and the .technical side of bacteriology and histology; second, special research work in various aspects of bacteriology, immunology, biochemistry of antiseptics, chemotherapy, effects of poison gas, acetone formation, and the methods of preparing certain drugs of German origin employed as therapeutic agents; and third, the production of serum on a large scale for the treatment of meningitis, pneumonia, and dysentery.

TEACHING COURSES

1. **The Surgical Treatment of Wounds.-The War Demonstration**
    1. Hospital of the Institute was planned as a school in which to teach military surgeons the art of applying the Carrel-Dakin treatment. Moreover, it was considered desirable to erect in the United States a unit hospital which might serve in construction and equipment as a model for such structures to be established on the western front.
    2. The hospital was composed of double-walled and double-roofed wooden buildings of paneled and take-down construction. In order to make it useful not only for the practical aims of war instruction in surgery, but as a model of a small hospital unit which might be copied, as in fact it was repeatedly, the details of structure· and equipment were carefully attended to. Thus grouped conveniently about two central ward buildings (see frontispiece) each providing twenty-five beds, with necessary attendance and service facilities, were research and operating pavilions, kitchen, and mess-rooms for nurses and employees, laundry, laboratories, lecture rooms, executive_ offices, and storage, with separate dormitories for physicians, nurses, maids, and orderlies. These were all connected by covered corridors,_ the more essential of which were completely enclosed. Heat, light, and power were furnished from the Power House of the Institute. The wards were ventilated by ceiling louvres with fan sashes in the windows, which by a turn of the hand could be substituted by muslin screens. By the lowering of large panels in the sides of the wards these could be thrown open at will for air in hot weather, or as. □re escapes in an emergency.
    3. The patients in the hospital at first were drawn from the civilian community, and finally, as the wounded were returned from France to the United States, from the Army and Navy.
    4. The teaching staff of the hospital consisted of surgeons, bacteriologists, and chemists assigned by the Surgeon General of the Army for instruction purposes, and of French military surgeons commissioned by the French Ministry of War. The course of instruction for medical officers covered a period of two weeks. The number of army and navy officers and enlisted personnel of _various grades given instruction from the opening of the hospital in August, 1917, to its close in April, 1919, was about 1,100. Twenty□seven nurses and eighty-three civilians also received instruction.
2. **Courses in Bacteriology, Immunology, and Clinical Chemistry.**
    1. The fact was early recognized by the Directors of the Institute that the Surgeon General would make heavy demands upon the personnel of the bacteriological and clinical chemical laboratories of the I country. It was thought probable that the existing highly trained personnel would prove inadequate to meet the needs. On the other hand, the number of partially trained bacteriologists and clinical chemists in the United States among practitioners of medicine who had ·entered the United States service as commissioned medical officers and others was obviously much larger. Hence it was proposed to establish teaching courses in bacteriology, serology, and medical chemistry for the latter class of students.
    2. The Surgeon Generals of the Army and Navy gladly availed themselves of this suggestion and nearly 600 medical officers and others attended the courses. The classes were conducted largely by members of the scientific staff of the Institute, many of whom were commissioned officers in the army and assigned to this duty.
3. **Treatment of Pneumonia.**
    1. One of the most serious menaces to the health of our troops has been pneumonia. The serum developed at the Hospital of the Institute for the treatment of so called Type I pneumonia having been demonstrated to be efficacious, it was imperative that military surgeons of the United States should be familiar with the best methods of its application. Hence arrangements were perfected by which medical officers were sent as internes to the Hospital of the Institute, remaining there from six weeks to several months, during which period they learned the modern technique of diagnosis and specific treatment of the disease. The officers so trained were later assigned to base hospitals in this country and abroad.
4. **Cardiography.**
    1. A small number of specially qualified medical officers were given instructions in modern methods of studying the heart by means of graphic methods: electrocardiograph, polygraph, and x-ray. This course was interrupted by the assignment of its head (Dr. Cohn) to overseas service.
    2. The Institute Hospital and the War Demonstration Hospital were officially designated as United States Army Auxiliary Hospital No. 1, and the laboratories as United States Army Auxiliary Laboratory No. 1.

SPECIAL RESEARCH WORK

IN ADDITION to new questions which were investigated as they arose in connection with therapeutic serum manufacture on a large scale, to meet the emergency of war-time requirements, a number of special problems were taken up.

The special chemotherapeutic studies in progress at the Institute on the treatment of syphilis, the requirements of the Army and Navy in this respect, and

the possibility of devising a more effective and less costly drug than the German preparation salvarsan led to a promising series of laboratory and clinical studies not yet completed.

Among the other activities carried forward by members of the staff of the Institute were: important contributions to the methods of preparing a protective and curative serum for gaseous gangrene,- whose control became so serious a problem early in 'the war; the making of acetone in aircraft production, by a new process involving bacterial action; studies on the synthesis of drugs, leading to contributions on the manufacture of certain drugs having important uses in the medical service; studies on poison gases. When hostilities ceased, Dr. Carrel and his assistants brought to a close in France studies in hemorrhage and shock, well under way in his temporary hospital at St. Cloud to which they were driven by the German aggressions at Compiegne. A series of studies was undertaken on the occurrence and characters of hemolytic and other streptococci which had been found to be of _ serious import in certain pneumonias, complicating measles, and influenza, especially in military establishments.

Researches on pneumococcic and meningococcic vaccine and on meningitis carriers were carried on in the Institute in New York or in field studies in various military camps and cantonments.

SERUM PRODUCTION

In order to help meet the suddenly increased demand for the curative serums worked out at the Institute, a special stable for horses was quickly erected and a special and suitable laboratory staff assembled at the Department of Animal Pathology. In undertaking serum manufacture on a large scale, the officers of the Institute had another object in view; namely, the standardization of the product. This latter consideration became of high importance in establishing standards for the commercial produ□ers. Three kinds of curative serums were manufactured in quantity; namely, antimeningococcic,, antipneumococcic Type I, and antidysenteric (polyvalent). Other serums intended for diagnostic purposes, such as Types I, II, III, and IV antimeningococcic, and Types II and III antipneumococcic serums were produced in smaller amounts. The quantities of the several kinds of serums distributed are as follows: 939.40 liters, or 46,970 bottles (20 cc.) of antimeningococcic serum; 344.79 liters, or 3,447 bottles (100 cc.) of antipneumococcic serum; 78 .36 liters, or 3,918 bottles (20 cc.) of antidysenteric serum. The amounts partially include the various diagnostic serums issued.

Reference should be made to the fact that before the United States entered the war, the In□titute had resumed the preparation of antimeningococcic serum, in order to meet the requests from England, France, Belgium, Italy, and other countries.

Arnold Meyer Spielberg (February 6, 1917 – August 25, 2020) was an American electrical engineer instrumental in contributions "to real-time data acquisition and recording that significantly contributed to the definition of modern feedback and control processes".[2] For General Electric[3] he designed, with his colleague Charles Propster, the GE-225 in 1959.[4] He cited the first computer-controlled "point of sale" cash register as his greatest contribution.[5] He was the father of film director Steven Spielberg.

Early life and career

Arnold Spielberg was born in Cincinnati on February 6, 1917.[6] He was of Jewish descent. His mother, Rebecca (née Chechick), was born in Sudylkiv, Ukraine; his father, Samuel, was born in Kamianets-Podilskyi, Ukraine.[7] They later immigrated to the United States, meeting and eventually marrying in Cincinnati.[8]

From the age of nine, Spielberg began building radios. He scrounged parts from garbage cans to assemble his first crystal receiver. "At 15, Arnold became a ham radio operator, building his own transmitter, a skill that proved fortuitous when he enlisted in the U.S. Army in January 1942, one month after the Japanese attack on Pearl Harbor, and joined the Signal Corps." After training as a radio-gunner for the Air Corps, his skills in the design of new airplane antennas elevated him to the position of Communications Chief of a B-25 Squadron in India.[5] During the Holocaust, Spielberg lost between 16 and 20 relatives.[9]:21

Spielberg married concert pianist Leah Posner (1920–2017) in January 1945.[10] After graduating from the University of Cincinnati with a Bachelor of Science in Electrical Engineering, he joined RCA's Advanced Development Department in 1949, where he did early work on servo and guidance systems.[6][11]

In 1960, Spielberg traveled to Moscow as part of a delegation of electrical engineers from Phoenix. The trip coincided with an incident that became the subject of his son's 2015 film *Bridge of Spies*.[12][13]Steven Spielberg described the event his father experienced at the time:

The Russians were putting the pilot Gary Powers' helmet and his flight suit and the remains of the U-2 plane on show for everyone in Russia to see. A military man saw my father's American passport and took him to the head of the queue and repeated really angrily to the crowd, "look what your country is doing to us."[12][14]

Work

When RCA entered the computer field, Spielberg began doing early circuit designs implementing computer logic. Moving into systems design, he was responsible for the design of a tape-to-tape data sorter. He designed and patented the first electronic library system, implemented as an interrogation system for data stored on an array of magnetic tapes. Promoted to Manager of Advanced Product Development, he was given responsibility for development of a "point of sales" system. The system involved a central processing computer called Recorder Central with ten satellites, specially designed point-of-sale units. All data were error-checked by feedback data verification. The system had all the capabilities of today's point-of-sale systems, including price lookup on a large drum storage unit, calculating sales transactions including sales tax and discounts, and credit verification.[2]

In 1957, Spielberg began working for General Electric. Here he was instrumental in developing the GE-200 series of computers.[15] The GE-225 was derived from the GE-312 and 412 process-control computers. Spielberg and Charles "Chuck" H. Propster had worked together at RCA on BIZMAC before designing the GE-225,[16] introduced in 1960.[10]

Spielberg retired in 1991 but continued consultation work for technology companies. He also worked with the USC Shoah Foundation Institute for Visual History and Education, formerly Survivors of the Shoah Visual History Foundation,[10] an organization founded by his son Steven.[17]

Personal life and Death

Spielberg had four children with his wife Leah: son Steven and daughters Anne, Nancy, and Sue. He also had 14 grandchildren and 20 great-grandchildren.[18] In February 2017 he became a centenarian.[19] Spielberg died from natural causes at his home in Los Angeles, California, on August 25, 2020, at the age of 103.[6][10]

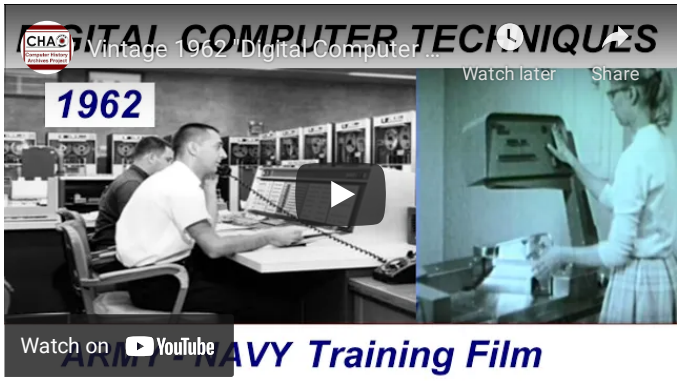
Vintage 1962 Army Navy Film "Digital Computer Techniques" - core memory, magnetic storage, etc.

May 30, 2016

Computer History Archives Project

Original un-edited 1962 film. A “somewhat dry” Army/Navy film of basic computer concepts. Detailed descriptions & diagrams of computing “input, store, control, arithmetic, output”, etc. Machine peripherals shown briefly. Film quality starts poor, but gets better towards the end. Nice description of “core memory” at 10:20 mins into the film. - Watch with a cold drink and some tasty snacks and enjoy this classic educational treat.



EVIDENCE TIMELINE

1930 - Feb 14 - Bar Mitzvah

Record Transcription:
World War Ii Army Enlistment Records

First name(s)	Arnold M
Last name	Spielberg
Race	White
Birth year	1917
Birth state	Ohio
Marital status	Single, without dependents
Enlistment year	1942
Enlistment month	Jan
Enlistment day	21
Enlistment place	Ft Thomas Newport Kentucky
Enlistment term	Enlistment for the duration of the War or other emergency, plus six months, subject to the discretion of the President or otherwise according to law
Branch	Branch Immaterial - Warrant Officers
Grade	Private
Soldier Number	15088831
Education	Fourth Year of High School
Resident county	-
Resident state	Ohio
Country	United States
Source	Civil Life
Record set	World War Ii Army Enlistment Records
Category	Military Service & Conflict
Subcategory	Second World War
Collections from	Americas, United States

In Service of Our Country

Corp. Robert Heldman, son of Mr. and Mrs. Warren J. Heldman, 740 Clinton Springs Avenue, and Master Sgt. Arnold H. Spielberg, son of Mr. and Mrs. Samuel Spielberg, 3560 Van Antwerp Place, participated in a short-wave broadcast from their base in India giving their squadron's history. Corp. Heldman recently transferred to the 14th Air Force in China and Sg. Spielberg is still in India with a bombardment squadron of the Army Air Forces.

[HN018V][GDrive]

[MWK note : I just ordered two books, unsure if this is a Robert K or a Robert W ... :

*"**Global Telecommunications : Layered Networks' Layered Services Robert K Heldman" (1992)***

"Future Telecommunications Information Applications Services Infr" (1993)

"Written by a top-level executive at US West - a leading Regional Bell Operating Company - this book explores the full range of information applications that exist now, how they will change in the 90's, and what narrowband, wideband, and broadband services and products will be needed. It also examines what must be done to the ageing telecommunications infrastructure in America to allow these products and services to become a reality."

CINCINNATI Social and Personal

Weddings & Engagements

Mr. and Mrs. Philip Posner, 819 Glenwood Avenue, announce the marriage of their daughter, Lea, to M/Sgt. Arnold Spielberg, son of Mr. and Mrs. Samuel Spielberg, 3560 Van Antwerp Place. The ceremony was performed by Rabbi Louis Feinberg in his study on Sunday, Feb. 25th.

A reception for the immediate families followed at the home of the bride's parents.

Among out-of-town guests were Mrs. Minnie Zuber, of New York City, cousin of the groom, and Capt. and Mrs. Bernard Posner, of Winston-Salem, N. C., brother and sister of the bride.

The bride and groom are making their home in Dayton, where M/Sgt. Spielberg is stationed at Wright Field.

Mr. Arnold M. Spielberg, new member of Eta Kappa Nu, national electrical engineering honorary fraternity at the University of Cincinnati, was named by that group as the outstanding pre-junior in electrical engineering for the year 1946-47, and awarded a book, "Standard Handbook For Electrical Engineers". A junior in the UC College of Engineering, he is a son of Mrs. Samuel Spielberg and lives at 817 Lexington Avenue.

1947/1949 - Co-Oped during college with the Crosley Corporation

SOURCE - (23 June 1987) Interview of Arnold Spielberg : Conducted by Anne Frantilla at Charles Babbage Institute

Text with OCR - [HI001D][GDrive] / Original PDF (but with OCR) : [HI001F][GDrive]

*"**And I co-oped at a now-defunct company called Crosley, where I worked on television production, engineering production line, first of all doing quality control, measuring all sorts of components to see if they stayed within specifications, and then later on working in the Test Equipment Department, designing test equipment to, you know, to use in assembly and alignment of radio receivers first, then television.** Then when television started to come in, I switched to designing wide-band amplifier-measuring devices, and then designed a signal distribution system for calibrating and tuning, you know, aligning television sets. And the last thing I did before graduation was to work on the line, troubleshooting sets that didn't seem to work, try to find out what's wrong and passing information back to Engineering, so they could put corrections into their design."*

Additional Information on Crosley :

1. **https://en.wikipedia.org/wiki/Powel_Crosley_Jr.**
    1. **Powel Crosley Jr.** (September 18, 1886 – March 28, 1961) was an American inventor, industrialist, and entrepreneur. He was also a pioneer in radio broadcasting, and owner of the Cincinnati Reds major league baseball team. In addition, Crosley's companies manufactured Crosley automobiles and radios, and operated WLW radio station. Crosley, once dubbed "The Henry Ford of Radio," was inducted into the Automotive Hall of Fame in 2010 and the National Radio Hall of Fame in 2013.
    2. He and his brother, Lewis M. Crosley, were responsible for many firsts in consumer products and broadcasting. **During World War II, Crosley's facilities produced more proximity fuzes than any other U.S. manufacturer, and made several production design innovations.**
2. **https://en.wikipedia.org/wiki/Crosley_Broadcasting_Corporation**
    1. The **Crosley Broadcasting Corporation** was a radio and television broadcaster founded by radio manufacturing pioneer Powel Crosley, Jr.. It had a major influence in the early years of radio and television broadcasting, and helped the **Voice of America** carry its message around the world.
3. **Voice 0f America - Crosley and General Electric ! (https://en.wikipedia.org/wiki/Voice_of_America)**
    1. " Before World War II, all American shortwave stations were in private hands.[12] Privately controlled shortwave networks included the National Broadcasting Company's International Network (or White Network), which broadcast in six languages,[13] the Columbia Broadcasting System's Latin American international network, which consisted of 64 stations located in 18 different countries,[14] **the Crosley Broadcasting Corporation in Cincinnati, Ohio, and General Electric which owned and operated WGEO and WGEA, both based in Schenectady, New York**, and KGEI in San Francisco, all of which had shortwave transmitters. Experimental programming began in the 1930s, but there were fewer than 12 transmitters in operation.[15] In 1939, the Federal Communications Commission set the following policy: "

Engagements—Weddings

GUTTMAN—SPIELBERG.

Mrs. Rebecca Spielberg announces the marriage of her daughter, Natalie Bernice, to Mr. Jack J. Guttman, son of Mr. and Mrs. Harry Guttman. The wedding took place December 21 at the Hotel Alms, Rabbi Louis Feinbe[illegible] officiating. Mrs. Arnold Spielberg was matron of honor and Mr. Ervan Guttman was his brother's best man. Among the out-of-town guests were Mrs. Sonia Lerman, New York; Mr. Henry Guttman and Mr. and Mrs. Gene Guttman of Connersville, Ind., and Mr. and Mrs. Edward Guttman of Wilmington, Ohio. Mr. and Mrs. Jack Guttman are residing in Cincinnati.

1949 - Graduates University of Cincinnati ... Senior thesis with Henry Federlin

Source : 2017 (Feb) - GE Corporation web site : "Happy Birthday, Mr. Spielberg: Computer Pioneer Who Helped Design GE's First Computers Turns 100 On Monday" / See : [HC0042][GDrive]

" AS: I studied electrical engineering at the University of Cincinnati, and I got my degree in 1949."

Source : 2015 (March 16) : Univ of Cincinatti : The grandfather of ET and the father of the modern Point-of-Sale system : See Source : [HE0028] [GDrive]

"One of his professors was Dr. William Osterbrock whom he almost electrocuted by accident while tuning an amateur radio set. He did quite well at UC and was recognized for his academics and was elected to Eta Kappa Nu International Electrical and Computer Engineering Honor Society of the IEEE his pre-junior year, Tau Beta Pi Engineering Honor Society his junior year, and he won an electric engineering award. [...] He did his senior thesis with Henry Federlin entitled "A General Purpose RF Sweep Signal Generator". Arnold described Henry as an expert machinist and a "straight forward guy". I was able to obtain a copy of this thesis thanks to Henry's wife. "

1949 - Joins RCA - Electronic circuits for missile systems

Source : 2017 (Feb) - GE Corporation web site : "Happy Birthday, Mr. Spielberg: Computer Pioneer Who Helped Design GE's First Computers Turns 100 On Monday" / See : [HC0042][GDrive]

" AS: [...] I got my degree in 1949. The first job I had was with RCA. I was designing electronic circuits for missile systems. When they started working on computers, I joined that group. After that, I moved to GE."

SOURCE - (23 June 1987) Interview of Arnold Spielberg : Conducted by Anne Frantilla at Charles Babbage Institute : See Text with OCR - [HI001D] [GDrive] / Original PDF (but with OCR) : [HI001F][GDrive]

So when I graduated I joined RCA. I joined RCA to work on television, but they had other ideas and they put me in some radar programs, and I kind of enjoyed that. In 1950 I transferred into a the beginning computer group there. So I really started working on computers in 1950. And at that time vacuum tubes were the main source of logic. And so I did some interesting work with the RCA tube design group in Harrison, New Jersey, because they were trying to design vacuum tubes that would respond as logic elements. They had one tube designed to be a three-input 11and11 gate, another one designed to be a two-input "and" gate, an "or" gate. And I built up some circuits with them. My job was to try to evaluate this and see if they were practical, should they continue with designing of functional, tubes. And a number of us pretty soon came to the conclusion that wasn't the way to go.

F: How much contact did you have with other people in the industry? Were there other people working on the same sorts of problems? Was it ... a kind of tight-knit community?

S: Well, there was a large group of people, and RCA, in order to get started there, was hiring people from all over. Some of their main sources of talent were people from MIT that worked on the Whirlwind computer. Which was the MIT's claim to fame. And there was a bunch of sharp guys, because the group that came together, RCA came out of research and development labs. While the development was going on down in Camden, New Jersey, there was some very original work going on up in Princeton Labs of RCA by a gentleman by the name of Jan Rykeman, who was the man would claims to have invented the magnetic core memory. And there was a big patent ...

GE Board Chairman Cites Vital Role Of Research

Saturday, October 24, 1959 The Arizona Republic, Phoenix, Arizona Page 17

DIRECTORS VISIT—Directors of General Electric Co. yesterday toured that firm's computer department plant in Phoenix. Shown watching the operations of one of the company's computers are, from left, Philip D. Reed, chairman of finance committee, director and former chairman of board of directors of General Electric Co.; Arnold Spielberg, manager of industrial computers and systems engineering for the Phoenix plant; Henry Ford II, president, Ford Motor Co., Dearborn, Mich.; and K. R. Geiser, manager of business systems for the Phoenix computer department. — (Photo by Herb McLaughlin)

Cordiner Speaks At Luncheon

"RESEARCH is the key to progress and prosperity in America," Ralph J. Cordiner, chairman of the board of General Electric, told a group of civic and business leaders yesterday in Phoenix.

Cordiner was host at a luncheon in Camelback Inn for members of General Electric's board of directors and a group of special guests.

The GE executive said 70 per cent of the production of General Electric companies today is devoted to processing and manufacturing of products which did not exist before the war.

Cordiner also emphasized that General Electric plows back more money into research and product development than it takes out in profits.

Cordiner added: "I would suggest to you business men of Phoenix that you invite to this state industrial companies which are especially interested in research, because research is the key to progress and prosperity in America.

"THE FUTURE of your city and your state will be assured if you bring to this state industries which are willing to spend more on research than they take out in profits.

"Phoenix was selected as the site for our computer development," he continued, "because our team of experts decided this was the best possible place in the United States for this operation. We have never regretted that decision. We like your community. We want our people to be part of your community and you have made us very welcome."

Governor Fannin welcomed the visiting board members to Phoenix and told them they have made a place for themselves in this community. He added that Phoenix and Arizona are "happy indeed" to have the General Electric operation in this state.

He especially commended General Electric for making it possible for Ken Michaels, manager of community relations and communications for the GE computer department here, to serve as president this year of the United Fund.

C. C. Lasher, general manager of the computer department in Phoenix, presided at the luncheon.

Among General Electric board members who visited in Phoenix yesterday while on a tour of the firm's facilities in California and Arizona were:

Henry Ford II, president and director, Ford Motor Co., Dearborn, Mich; S. Sloan Colt, director and member of the executive committee, Bankers Trust Co., New York; Donald K. David, vice chairman of the board, Ford Foundation, New York; Charles D. Dickey, chairman, committee on trust matters, Morgan Guaranty Trust Co., New York; John Holmes, director, Swift and Co., Chicago.

Frederick L. Hovde, president, Purdue University, Lafayette, Ind.; Gilbert W. Humphrey, president and director, Hanna Mining Co., Cleveland; John E. Lawrence, partner, James Lawrence and Co., Boston; George H. Love, chairman of the board, Consolidated Coal Co., Inc., Pittsburgh; Thomas B. McCabe, president, Scott Paper Co., Chester, Pa.; George G. Montgomery, chairman of the board, Kern County Land Co., San Francisco.

Henry S. Morgan, partner, Morgan Stanley and Co., New York; Robert Paxton, president, General Electric Co., New York; Philip D. Reed, chairman of the finance committee, General Electric, New York; Robert T. Stevens, president, J. P. Stevens and Co., Inc., New York; Sidney J. Weinberg, partner, Goldman, Sachs and Co., New York; and Robert W. Woodruff, chairman of the finance committee and director, the Coca Cola Co., Atlanta.

Engineers Told Russ Standards Below U.S.

By JOANNE SMOOT

"Russian scientists admit the United States is ahead technically, but they firmly believe the U.S.S.R. will surpass us.

Speaking from first hand experience, Arnold Spielberg told the Arizona section meeting of the American Industrial Engineers last night at the Desert Sun that Russians "believe the United States wants war."

"And, those that I spoke to were some of the most educated scientists in Russia," Spielberg said.

HE RECENTLY returned from the International Federation of Automatic Control's Congress held in Moscow, where he acted as delegate from the American Automatic Control Council.

"I spoke to many of Russia's top scientists, and they asked me questions like: 'Why is the United States so aggressive? Why are U. S. military bases surrounding Russia?' "

A radar scientist begged: "Please don't drop atomic bombs on us," said Spielberg.

"Russia is a land of contrast. On the one hand they have many achievements, but on the other, they fall quite short of U. S. standards," the speaker explained.

"IT'S LIKE the two Russian scientists who were talking, and one said: 'You know, we have an atomic bomb small enough to fit into a suitcase and smuggle into New York City!' "

"And the other replied: 'Ah, go on . . . where would we get a suitcase?' "

Spielberg said the delegates from some 30 nations attending the congress were treated royally, but certain restrictions were made on their freedom.

"WE COULDN'T take any pictures from the plane once we were over Russian territory, yet there was no customs check when we arrived.

"We couldn't photograph the Kremlin in Moscow or the factories," he said.

Moscow is a conglomeration of the old and the new, without a happy medium. For instance:

"There are banks, but no checks can be written.

"There are computers, but no cash registers or adding machines.

"Skeleton keys are used in a hotel that was built in 1957."

In the same hotel, Spielberg related such oddities as "paint that rubbed off the walls, one notebook to sign in all guests in the 23 story structure."

"THERE WERE six elevators in the hotel, which was Moscow's best, but never more than four worked at one time. It took nearly 20 minutes to get to the 23rd floor," he related.

Spielberg praised Russian education, where students are paid $80 a month to attend a university. "In 1959, one Russian university graduated 107,000 engineers and in 1960, 119,000 were graduated. This is approximately 20,000 more then U.S. school graduated," he said.

He also noted that Russian scientists "were skeptical of our advanced engineering," but at the same time, curious.

Russia is a very cultural minded nation, he said. In contrast, "Communism replaces religion, and their deity is Khrushchev."

"RUSSIAN interpretors are thoroughly indoctrinated in communism but they couldn't translate technical phrases in the Science Museum."

Spielberg said the U-2 is one of the most prominently displayed objects in Moscow's huge park. "I didn't think the plane looked like it had exploded, or been shot down. But who knows?"

Spielberg said he was most impressed by: "The complete indoctrination of the Russian people, their determination to convert the world to communism, and their planned economy."

"KHRUSHCHEV means to see the Russian flag flying over each nation in the world before his death," said Spielberg.

"The only thing they (the U.S.S.R.) respect, is power. We must take the aggressive approach to freedom," he emphasized. "We must never back off, but be firm in our relations with Russia."

"I'd rather be dead than live under communism," he concluded.

R-D: Key to Expanding Economy

By BERNICE JONES

Research and development—RD, as the initiated call it—is the fire that keeps the economic mule off its haunches.

Bernice

Research—the inquiry of scientific minds into new knowledge that will culminate in new or improved products.

Development—the time, money, and talent devoted to putting research discoveries into practical, usable form, and into the market place for customers to buy.

Women's Business Views

It can be a new hairpin; a new method of cooking; new fabrics for fashion (bless the drip-dry researcher); the perfect vehicle for earth-moon round trips; someday maybe even a solution for keeping grass green without water, and whisker-brisk without benefit of mower.

It may be true, what they say, that there's nothing new under the sun.

But there's lots of things around our grandparents never dreamed of, let alone used.

And lot's of things in the making that none of us will see, but our grandchildren will take for granted.

IN DEER VALLEY—Just a few weeks ago General Electric Computer Division received a package from its Semiconductor Products Department in Syracuse, N.Y.

It contained a number of what Arnold M. Spielberg describes as "early June pea" sized transistors that will add efficiency to data processing computers.

Transistors are old hat now—magic little pieces of rare metal that are natural transmitters of electric signals.

But this new batch represents a break-through in the use of silicon that is expected to bring new efficiency in home appliances, such as television and radio.

Silicon transistors have been expensive and therefore pretty much limited to military and space application. Of more general use have been transistors made of germanium, less expensive.

OLD TALE — Silicon is preferred because of its greater heat resistance and reliability of performance.

At work in GE laboratories were researchers who finally discovered a way of treating silicon so that it could be "boxed" in a coat of epoxy (plastic instead of the metal housing used previously.)

Result: The better performing silicon semiconductors at prices less than those for germanium, with still greater savings in store when the development stage reaches volume production.

In your house and mine: TV and radio that will probably give better and longer service (without calling the repairman), with signals that are now somewhat elusive coming in louder and clearer.

Engineer Spielberg, incidentally, is a war-time air corps bomber squadron communications chief who had built himself a wholly different career. On high school graduation he went into retailing; left a post as store manager for Lerman Brothers in Richmond, Ky.

FROM HAM—A ham operator since early youth, his war experience sent him back to the University of Cincinnati for a degree in electrical engineering, obtained under a work-study system that put him in quality control at the Crosley Division of Aviation Corp.

He came to Phoenix in 1957 after designing military navigational systems for RCA; still remembers his wife's dismay at the description of our booming Arizona culled from a 1929 edition of World Book—"desert wilderness populated chiefly by Indians."

A more current magazine article on Scottsdale made her somewhat less apprehensive and now "she wouldn't dream of living anywhere else."

BACK TO — transistors.

At Motorola several years ago, its researchers found a way to put transistors to work in automobile ignitions.

If you're handy under the hood, conversion kits are on the market so you can install your own.

Advantages claimed smoother, easier starting; 100,000 miles on one set of points; five to 10 per cent saving on gas mileage; leaping passing ability.

The automotive industry has found some other semiconductor devices, important aids for better motoring. But for some reason, transistor ignition systems are sitting on the side lines.

Cost may be a factor, but it would appear that this would be more than offset by the savings made possible through the greater efficiency.

Well, questions are a part of research and development. Maybe someone can provide the answer to this one.

REPUBLIC
CITY
Phoenix, Wed., June 5, 1963 ○ The Arizona Republic 9

Steve Spielberg, 16, Wins Film Award

A 16-year-old Arcadia High School student won top honors at the first Arizona Junior Film Awards competition with his own production of a war movie.

Steve Spielberg, son of Mr. and Mrs. Arnold Spielberg, 3443 N. 49th Ave., won a movie camera and trophy for his 44-minute, silent battle film, "Escape to Nowhere."

Young Spielberg's school also received a 12-volume set of books on movie production from Canyon Films of Arizona, sponsor of the contest.

THE COLOR production, in which Spielberg's friends acted as German and American soldiers, shows the fighting spirit of GI's in World War II.

Second place winner was Susan Palmbach, 15, daughter of Mr. and Mrs. Leonard H. Palmbach, 2339 W. Mulberry Drive. The West High student won a plaque for a humorous film, "Pete and Paul," shot at Encanto Park with school friends as actors. It was black and white with taped sound.

A PLAQUE for third place went to Norpho, the North Phoenix High photo club, for its adventure drama, "Spirit of the Superstitions," taken on location in the Superstition Mountains. The 15-member group, directed by teacher Robert Kasold, made the film in black and white with sound on tape.

Awards were presented at the Paramount Theater, 209 W. Adams, by Del Shelley, director of audio-visual services for Phoenix Elementary School District, and Raymond A. Boley, president of Canyon Films.

[HN018P][GDrive]

1963 (Dec 08)

by Esther Clark

Teenage Cecil B.

In the field of amateur movie-making, increasingly popular with teenagers, Steve Spielberg is an award winner.

photographs, Ralph Camping

FREEPORT, ARIZ., EXISTS only as a city in a science fiction thriller of a 16-year-old Phoenix movie maker with an amateur but honored standing and a professional outlook.

When Steve Spielberg winds up "Firelight" with retakes during Christmas vacation, the 90-minute sound-color film will be his sixth major production. The fifth, "Escape to Nowhere," won this year's first annual Film Festival award, sponsored by Canyon Films.

If plans work out for the Arcadia High School junior, the public may view "Firelight" sometime in January. Its first showing, he hopes, will be for AHS drama classes.

PROCEEDS FROM THE PUBLIC premiere are earmarked for Steve's pet charity, Perry Institute, for mentally retarded children. What other profits accrue from succeeding showings will go toward production of the next cinematic venture.

"It grows on you. You can't shake it," is the reason the slightly built, fast-talking teenager gives for hanging onto a movie camera. His first experience with one was as an Ingleside School seventh grader.

It was an eight-minute western in color, "The Last Gun." The "good guys," in white hats, won. It also was the beginning of an all-consuming hobby from which he plans to launch a career as a producer.

GOOD AND BAD, EARTHLINGS in "Firelight" are doomed to a weird fate because their obsession for interplanetary travel affords the opportunity to take hate, war and prejudice to outer space residents.

To prevent such an occurrence, script writer Steve has leaders of the planet Altaris transport entire cities from earth, but in miniature, as exhibits Altarians would pay to see.

When "Firelight" is finished, nearly 100 actors will be in the cast, fellow students being the principals. Profit from previous films paid for the $60 pilot; "angels" he hopes will come through for the remaining $300.

STEVE FIGURES HE HAS understanding parents, who not only approve of his movie making but also of his taking over the house and yard for filming or "company" huddles.

During the filming of the "Firelight" pilot, at least 15 teenagers and uncounted pieces of equipment were in, through and around the Spielberg home. At one point in shooting, a neighbor passing slowly in his car shouted a greeting to Steve's parents that included mention of the flashing red light by the carport door. This was a signal that filming was in progress and onlookers were to be quiet.

Says Mrs. Spielberg about the constant commotion at her home: "We're all for Steve's hobby; this way we

know and the parents of his teenage friends know where they are; they're not cruising up and down Central Avenue."

DAD DOESN'T EVEN MIND that he never got to use the movie camera the family gave him for Father's Day in 1958. Steve tried it out and didn't let go.

Since Steve is the only boy and oldest in a family of four, he occasionally finds himself in touchy situations with the sisters. Once in a while they are allowed to "get into the act," like the time an emergency arose when World War II-themed "Escape to Nowhere" was made.

To all appearances, there are no "women" in the movie, not even an Army nurse. But Steve's 13-year-old sister, Anne, does have a few seconds in the picture, which aims to depict the bravery of American GIs in capturing a strategic hill in Africa (Camelback Mountain).

"WE WERE SHY A SOLDIER the day we filmed one scene, so we had her put on a uniform and helmet. We got rid of her in a hurry," Steve smiles unabashedly. He did it by holding the camera on her only long enough to show an uphill crawl and then the fatal "shot" from a Nazi rifle.

The same 23-member cast movie, featuring Steve's high school friends, gives the impression in another scene of a long line of GIs sneaking past the enemy. After-school actors were hard to come by that day, too. Steve and a classmate simply went around and around the grinding automatic camera on the ground.

For a war picture, his is singularly without gore because he, as producer-director-script writer has an aversion to "too much blood." At the insistence of the "you gotta have it" from the cast, he thinned red oil paint to lend realism.

COSTUMING IN "FIRELIGHT" is no problem; everyone is in modern attire. It was different with the war picture. Intending for enemy soldiers to wear black shirts, Steve dyed white T-shirts but the color failed to take and that's why the bad boys are in blue.

Drama and music classes the young movie maker takes in school are a big help. He's putting experience as a school orchestra clarinetist to use in writing the score for the science fiction film. Should he ever write a script calling for dancing, he could instruct at least the twist, mashed potato and popeye.

Lights out. Action!

E. T.'s grandma

1983-03-09-the-akron-beacon-journal-pg-b-1-clip-spielberg

Steven Spielberg's mom star of her own galaxy

By Irene Rogers

Leah Posner Spielberg Adler, a very long name, a tiny, petite lady, a soaring gigantic spirit. Leah and husband Bernie Adler are the originators of The Milky Way, Beverly Hills' first and only kosher dairy restaurant, and Leah is its true star.

As she sits talking on a Sunday afternoon just before the restaurant opens for the evening, Leah is looking self-assured and charming. She is bright, funny and outspoken.

And excited. "My spirit is the same as when I was 17. I'm excited all the time, and I am very excited about being in the restaurant business. There is something about food that brings people to a very emotional level. I love producing this show every day. It's like a production at the Met! The yelling, the screaming, the details. 'Is the soup ready? Are the tables set? Can we open the doors?' "

IN ADDITION to being the star of The Milky Way, Leah Posner Spielberg Adler is the mother of the most spectacularly successful young man in the world today, Steven Spielberg, who before the age of 35 has achieved unparalleled success in the motion picture industry with his productions of *Jaws*, *Close Encounters of the Third Kind*, *Raiders of the Lost Ark*, *Poltergeist* and, of course, the phenomenal *E. T.*, which really makes Leah E. T.'s grandma.

Leah Spielberg Adler

In exploring Leah's life, marvelous glimpses of Steven Spielberg emerge, and one sees where his spirit hails from.

"When I want something, I want it so much I can move mountains. I get superhuman strength, and Steve is exactly like this, too. With us there is no such thing as 'impossible' or 'No, you can't do that.' "

Leah, who was born and raised in Cincinnati and who studied at the Conservatory of Music there, is a fine concert pianist. "I studied since I was 5, and I always had a madness for good music. It was never a case of my parents telling me to practice — I always loved to play.

"I come from a very nurturing background. My father was very creative, but very poor. In this day and age, he probably really would have made a mark. He danced ballet so beautifully — he was from Russia. I was raised on Nijinski and how Nijinski's leaps looked like he was suspended in air. I was raised on stories of Henrik Ibsen in Norway. Somehow my father found his way into Norway and became a friend of Ibsen's. He also played the most beautiful classical guitar. I still have his guitar at home.

"I loved to play piano for my folks. Whenever I practiced, my mother and father would come and sit in the room. It was as though I was giving a concert. I

See E. T.'s, page B2

[HN018C][GDrive]

E. T.'s grandma star of her own galaxy

Continued from page B1

played my whole life until The Milky Way was born. Now I do not have the time. Somehow The Milky Way has taken over. My creative drives are coming out in the restaurant."

LEAH WAS married in Cincinnati, and Steven was born there. When Steve was 8, Leah's husband, Arnold Spielberg, was sent to Phoenix, Ariz. He was one of five people who opened up the computer department for General Electric. "I was hysterical. I mean, in 1955 what nice Jewish girl moved to Arizona? I looked in an encyclopedia (it was published in 1920, but I did not notice at the time), and it said, 'Arizona is a barren wasteland.' I went there kicking and screaming. I had to promise Steve a horse, because he didn't want to go either.

"I never made good on that promise, and he still reminds me of that today. We took the train across the country, got off the train and instantly fell in love with Phoenix. It was a wonderful place to raise the kids. That's where Steve did all his early movie stuff."

Leah has three daughters, in addition to Steve. "Anne is also a writer and just getting started. Recently sold her first film project. Nancy lives in New York City and is president of a jewelry company and has just become engaged. Susie is married, lives in Washington, D. C., and had her first baby earlier this year. They are a wonderful group of kids."

Steven Spielberg's movie-making started in early childhood with his father's 8mm movie camera, and he soon progressed to his own equipment.

"We had the wildest life. He's been working at his craft since he was 10. I had a beautiful house, which Steve took over. My living room had dollies and flood lights and big heavy cables running across the floor. We were all involved. The whole family. Always.

"His story is filled with more happenstance than even mine is. Wanting — being. When we came out here, we had no pull. We didn't know anybody at all. He started Long Beach State at 17, and after his first semester he quit and started going every single day to Universal Studios.

"For some reason which we never figured out, he got by the guards just by his looking like he belonged there. Wherever he went, into the sound stages, into the editing department, he learned. From 9 to 5 every day, like he had a job there which he didn't, he would move around that studio, from one department to another, absorbing everything."

She adds, "Steve and I are very close; we have this mother-son team going, so whenever people finish interviewing him he says you got to go see my mom. So they do."

Leah Spielberg Adler and son, Steven Spielberg

LEAH'S SECOND husband, Bernie Adler, was director of the computer department for Lockheed, and seven years ago Lockheed decided to move the computer department back east. Then Leah and Bernie were faced with the decision.

"We decided we did not want to go back to the days of waking up to 'eight inches of snow forecast for today,' and so Bernie decided it was time to open his own business.

"Bernie and I work wonderfully together (they have been married for 17 years). I scream a lot, but he ignores me. We have a perfect division of labor. I'm center stage; he is backstage. I run the front, I meet, I greet, I talk a lot. But Bernie is the brains."

BOTH OF Leah's parents have died, but, as Leah says, "They are with me constantly. My mother was born in 1881 and was one of the few women who went to college. She used to speak on the radio. She was a public speaker and was very well known in Cincinnati. She did the book reviews. She was full of enthusiasm.

"There was always such a charged-up feeling in the house. Everything was exciting. My dad would come home with some chestnuts and say, 'Look, kids, what I've got!'

"My mom died when Steve was 9 or 10, but she had always said one thing about Steve: 'This boy is going to make a name for himself in the world.' She adored him. A Variety headline the other day said 'E. T. Sweeps the World,' and I thought of my mother."

Irene Rogers is a free-lance writer living in California.

Arnold Spielberg joins co-chairs Karen Stevens, left, and Paula Raelson at heart institute benefit.

CONWAY

Continued from E1

When you've done that, you don't worry about the flavor of birthday cake."

Said Williams: "Actually, I like angel food. It's the frosting that I'll take any way it turns up."

◇

Spielberg, heart to heart: Movie director Steven Spielberg's father, Arnold Spielberg, was among guests who attended the "In the Mood" dinner benefit for the Sadleback Memorial Heart Institute last week at the Four Seasons Hotel in Newport Beach.

A resident of Leisure Word in Laguna Hills, the 78-year-old Spielberg said it was institute cardiologist Richard Caso who helped give him a new lease on life after heart disease was diagnosed two years ago.

"Dr. Caso placed me on a diet and exercise regimen . . . and I've since lost about 20 pounds and feel better than I have in years," he said.

Spielberg says he feels so good he was able to hike four miles at altitudes exceeding 11,000 feet during a recent visit to Crater Lake in Aspen, Colo. Karen Stevens and Paula Raelson were co-chairs of the $100 per-person benefit.

◇

Honoring the Herberts: Gavin and Ninetta Herbert, owners of Casa Pacifica in San Clemente—once Richard Nixon's Western White House—were honored last week by Julie Nixon Eisenhower at a docent tea held at the Richard Nixon Library & Birthplace in Yorba Linda.

The Herberts were singled out by Eisenhower for their donation of the Carillon electronic bells that chime hourly at the library, playing patriotic songs such as "Stars and Stripes Forever." She presented them with a signed, framed photograph of her parents.

Eisenhower was in California to attend a luncheon at Arco in Los Angeles with library supporters who are organizing the April 27 "Architect of Peace" dinner that will honor Walter Annenberg. After the luncheon, Eisenhower met with library docents to thank them for their support.

◇

Pacific Symphony bash: French-Canadian pianist Alain Lefevre schmoozed with Pacific Symphony supporters backstage at the Orange County Performing Arts Center following his performance of Rachmaninoff's Piano Concerto No. 2 in Segerstrom Hall last week.

Orchestra buffs dined on pastries and sipped coffee in Founder's Hall, while Lefevre and his wife, Johanne, an attorney, received accolades for his performance.

Johanne said her husband of 11 years had been practicing "eight hours a day, six days a week" to prepare for his appearance with symphony conductor Carl St.Clair.

Lefevre, 32, called the Rachmaninoff concerto "one of the most extraordinary concertos ever written" and said the occasion was a sentimental one for him. "It was a year ago that I lost my father," he said.

Among orchestra supporters raving over Lefevre's work was Sharon Lesk, a trustee of the Leo Freedman Foundation, sponsor of the orchestra's classics concert series.

Lesk had more than the concert to celebrate, she said.

"I have just been named by Ross Perot the new California executive director of United We Stand America," said Lesk, an attorney.

Her agenda for the organization?

"I want to unite the group and begin to debate issues like whether or not there should there be another political party," she said.

Lesk said she was unsure whether Perot would make another stab at the presidency in 1996.

2017 (Feb) - GE Corporation web site : "Happy Birthday, Mr. Spielberg: Computer Pioneer Who Helped Design GE's First Computers Turns 100 On Monday"

Source : [HC0042][GDrive]

The name Spielberg brings to mind a movie magician whose blockbusters changed storytelling forever. But Steven Spielberg isn't the first disruptor in the family. His father, Arnold, who turns 100 on Monday, helped mold computing — a field whose rise and dominance over all areas of life has no peer in the history of mankind.

Arnold used to design groundbreaking computers for GE in the 1960s. In 2006, he received the IEEE Computer Pioneer Award — one of the industry's top honors.

Arnold has been interested in machines, radio and electricity ever since he was a boy growing up in Cincinnati, Ohio. He served as a communications chief in a B-25 squadron in World War II and later established himself as an expert in early computer systems. Coming to work at GE in the 1950s, he helped revolutionize computing when he designed the GE-225 mainframe computer. The machine enabled computer researchers at Dartmouth University to develop the BASIC programming language, an easy-to-use coding tool that quickly spread and ushered in the era of personal computers as well as movies driven by computer graphics — a tool mastered by his son.

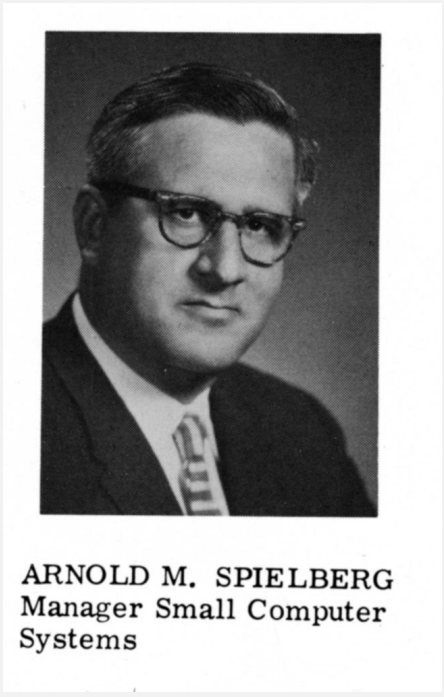
Last year, we visited with Arnold for a one-on-one interview. Surrounded by photographs with President Barack Obama, Hollywood actors and directors, family and framed patent certificates — he received 12 patents in total — he talked about computers, his love for science fiction and his work on Hollywood blockbusters such as Christopher Nolan's "Interstellar." What follows is an edited version of our discussion.

GE Reports: When you started designing computers back in the 1950s, the technology was still very new. How did you choose that line of work?

Arnold Spielberg: I was always interested in electricity. I liked working with magnets, and I liked working with radios. I knew about Edison and Tesla, but not in detail. I got my first crystal radio set when I was 9. It's basically a diode that can detect radio waves, and I played around with it. But I never could get it working until a radio repairman who lived next door helped me set it up.

GER: What else were you building?

AS: Once I saw an Erector Set in a hardware store. I went inside and asked the owner if I could use it to make a steam shovel and put it in the shop window so they could sell more Erector Sets. He grudgingly agreed and I sat in the back every day after school until it was finished. Later, I brought my mom over and showed her what I built. Sure enough, I got the construction set for Hanukkah. But I was also influenced by science fiction. There were twins in our neighborhood who read one of the first sci-fi magazines, called Astounding Stories of Science and Fact. They gave me one copy, and when I brought it home, I was hooked. The magazine is now called Analog Science Fiction and Fact, and I still get it.



[HC0043][GDrive]
Arnold Spielberg in 1961, when he worked as the manager of GER's Small Computer Systems business. Image credit: Museum of Innovation and Science Schenectady

[HC0044][GDrive]
Dartmouth had one of our computers, and they programmed it to develop the computer language BASIC," Spielberg says. Image credit: Museum of Innovation and Science Schenectady

GER: How did you end up in GE?

AS: [...] I joined GE's computer department in Schenectady, New York, in 1955. My first job was designing circuits for the first computer process controls. The department was just starting. I stayed at the YMCA and visited my family, which was still back in New Jersey, on the weekends.

GER: Who were the computers for?

AS: The first ones were used for the industrial market. Our customers were paper mills and steel mills like Jones and Laughlin Steel Company in Pittsburgh, Youngstown Sheet and Tube in Ohio, and McLouth Steel in Michigan. They were the first customers ever to have a control system for a hot strip mill.

GER: What did the computers do?

AS: The first computers I built were data-acquisition systems. Their job was to monitor defects. They were a wire-programmed system, which means that they were uniquely designed to do just that job. Another computer called GE-312 monitored a turbine for Southern California Edison. We didn't dare to control it because that required stops and starts, which could have endangered the machine's life. The function then was just to make sure that it stayed within specified temperature ranges and that all the contacts were opened or closed as prescribed.

GER: Tell me about the computer Dartmouth used to write BASIC.

AS: Unlike the previous computers, the GE-225 — as it was called — was a business computer. It stored its own software, handling the input and output of data. We relocated the factory to Phoenix and sold it within GE as well as to the external market. GE used them for general business applications and some scientific work, but mostly to do business processing. I was in charge of the small-computer-systems group, whose job it was to design the circuits, design the logic, plan the system and put it all together.

GER: How small was this small computer?

AS: The computer consisted of three racks of equipment. Each rack was 2 feet wide and 7 feet tall. There was air conditioning at the bottom of each rack to cool it off because the circuits ran pretty warm. The memory could range from 8,000 to 16,000 20-bit words. It had an auxiliary memory that could go to 32,000 20-bit words. The computer interfaced with magnetic tapes, with punch cards and punch tapes, among other things.

One of our colleagues, Bill Bridge, designed a computer interface for Dartmouth that could transfer information from the computer to dumb terminals. They had no memory and no capability of doing computation. These were just input and output devices with keyboards. People could connect between 15 to 20 terminals to one computer and use that for time sharing. GE was one of the first companies to do time sharing and allow multiple terminals to talk to a computer.

Dartmouth had one of our computers, and they programmed it to develop the computer language BASIC. It allowed people to use the system to solve problems and handle data coming in out of the computer. Steve Wozniak may have used one such remote terminal to write software for Macs.

GER: Did your friends or family understand what you were doing?

AS: Back then I didn't have that many friends who were interested in computers. It was like a big mystery to them. My son Steven came to visit once, and I showed him the factory and the engineering floor. I tried to get him interested in engineering, but his heart was in movies. At first I was disappointed, but then I saw how good he was in moviemaking.

GER: You were also involved in movies.

AS: I went to Caltech, and met with the astrophysicists Kip Thorne and Lisa Randall and several other scientists, and we sat there and brainstormed ideas about black holes for the movie "Interstellar." It was a lot of fun because we kicked around all kinds of ideas about the size of black holes and how feasible they are and how likely there actually may be one.

GER: You didn't turn Steven into an engineer, but he turned you into a moviemaker.

AS: It's in the family now.

2015 (March 16) : Univ of Cincinatti : The grandfather of ET and the father of the modern Point-of-Sale system

Source : [HE0028][GDrive]

[...] Arnold Spielberg graduated from Hughes High School which cross the street from UC at the southwest corner and located on Clifton Avenue where Calhoun and McMillan meet Clifton. [...]

When he talked about Cincinnati, I was able to relate and when he mentioned the Hughes vs Roger Bacon football rivalry, he noticed I was particularly interested because I went to Roger Bacon. If you want to learn more about what he did outside of his Cincinnati time see a list of interviews below. I will focus on his time in Cincinnati and at UC. His first wife, Leah Posner, graduated from Walnut Hills High School and so did his brother Russell. They were high school classmates of Viola Woodward who also graduated from UC and did computer programming on the ENIAC (see UC's first computer geek).

Arnold Spielberg was born on **February 6, 1917** in Cincinnati, Ohio. He attended Avondale Public School and then Hughes High School (1930-34). At Hughes he won an award for his science ability, but his overall GPA was not good enough to get a college scholarship. His parents were not well-to-do and his father had been sick at the time so he had to go to work. The summer between his junior and senior year in high school he work in **Cynthiana, KY**, which is a small town north of Lexington. **His cousins had a small department store there. After graduating he went back down there and work for a total of seven years until 1941 when World War II started.**

At Hughes he discovered his love for math and science. He also took Spanish, architectural drawing, and drafting. In those days, there was a boys' homeroom and girls' homeroom. Oatis Gates was the head of the homeroom who was well-liked by the students. He worked out with the gymnastic team and learn how to do tricks on the horizontal bar and other apparatus. He built up his upper body strength even built a horizontal bar for use when he lived in Kentucky. Two of his friends, Sid Patterson and Roger Walby(?), were the co-captains of the football team. Their chief rival was Roger Bacon and Hughes beat RB his senior year he told me with a satisfying smile. He went back to Hughes on two different occasions for his class reunion.

He was friends with Jake Schott (class of 1933) who was also a ham radio operator and later went on to become the Chief of Police in Cincinnati. He (treasurer) and Jake formed the radio club. Withrow High School had a glider club (a secondary glider that was towed the entire time) and the two schools did a project together were they put a receiver in one of the gliders to see if they could communicate with it. This experiment helped him later when he was stationed at Wright-Patterson Air Base in Dayton. He learned how to shoot using a rifle that he borrowed from Jake. Later, Arnold bought a used Steven's Walnut Hill Single Shot 22 Caliber rifle from an old hunter in Cynthiana which he had recently given to his son, Steven. This is the gun his son first had learned how to shot.

Arnold was also a ham radio operator (call sign of W8IDX) using a system he had built himself. He was more interested in electronics than working at his cousins' department store. He had to change his call sign while living in Kentucky to W9AUM (Always Under Modulated). He also built a phone transmitter during that time. **He learned the department store business which paid later in his life. He went from stock-boy to assistant manager.** In 1940 he was transferred to a store in Richmond, KY where he served as a co-manager. He learned a lot about managing a business, skills that would serve him well later in life.

At the onset of WWII, he decided to enlist since **he knew he would have been drafted anyway so he joined the Army Signal Corp**. He enlisted at Fort Thomas, KY and after a week he was sent to Louisville and later to New Orleans at New Orleans Army-Air Force Base and the 422nd Signal Company. **Part of his responsibilities was to teach Morse code to the new recruits** who did not seem very interested in learning any of that until he started telling "dirty" stories and then suddenly their learning shot up. **In May of 1942 he was sent off to what was then Karachi, India (now Pakistan) zigging and zagging on the way there. This was at the height of the German submarine attacks something that another UC Bearcat, Dr. Paul Herget, had a hand in preventing.**

When he came back to the United States, he was stationed at Wright Field where his brother was also stationed. He was a master sergeant working on designing a radio receiver to help guide a bomb. He knew he wanted to engineer after his experiences in the war and his work at Wright. He did his freshman and sophomore years in one year. Keep in mind that he was an older student having graduated from high school in 1934 and after having served in the war he was quite mature. He and Leah were also married. They lived in Avondale in a two-family house. He would walk to UC or take the street car.

[...]

Mr. Spielberg was recognized by the IEEE in 2006 as a Computing Pioneer for his work on developing a computerized Point of Sale System while working for RCA. The system was tested in Cleveland, Ohio at the former Higbee's Department Store. Higbee's was made famous in the movie "A Christmas Story" and now is the site of the Horseshoe Casino Cleveland. This citation reads "For recognition of contribution to real-time data acquisition and recording that significantly contributed to the definition of modern feedback and control processes." **Mr. Spielberg went on to work at General Electric where he developed some of their first computers and later for IBM, Scientific Data Systems, and ended his computing career with Burroughs Corp (which became Unisys).**

Footnote:

1. While at the GE Computer Department Alumni symposium in 2006, I met another UC Bearcat who also worked for GE and helped start the time-share industry in the 1960s. His name was Gerry Haller.

Some of the films he cited as early influences that he grew up watching include the Godzilla kaiju film King of the Monsters (1956), which he called "the most masterful of all the dinosaur movies because it made you believe it was really happening",[32] as well as titles such as Captains Courageous (1937), Pinocchio (1940), and particularly Lawrence of Arabia (1962), which he cited as "the film that set me on my journey".[33] In 1963, at age 16, Spielberg wrote and directed his first independent film, a 140-minute science fiction adventure called Firelight, which would later inspire Close Encounters. The film was made for $500, most of which came from his father, and was shown in a local cinema for one evening, which earned back its cost.[34]

After attending Arcadia High School in Phoenix for three years, his family later moved to Saratoga, California where he attended and graduated from Saratoga High School in 1965. He attained the rank of Eagle Scout. His parents divorced while he was still in school,[35] and, soon after, he graduated. Spielberg moved to Los Angeles, staying initially with his father. His long-term goal was to become a film director. His three sisters and mother remained in Saratoga. In Los Angeles, he applied to the University of Southern California's film school but was turned down because of his "C" grade average.[21]:548 He then applied and was admitted to California State University, Long Beach where he became a brother of Theta Chi Fraternity.[36][37]

While still a student, he was offered a small, unpaid, intern job at Universal Studios with the editing department.[38][39] He was later given the opportunity to make a short film for theatrical release, the 26-minute, 35 mm Amblin', which he wrote and directed. Studio vice president Sidney Sheinberg was impressed by the film, which had won a number of awards, and offered Spielberg a seven-year directing contract. It made him the youngest director ever to be signed for a long-term deal with a major Hollywood studio.[21]:548 He subsequently dropped out of college to begin professionally directing TV productions with Universal.[40][41] Spielberg later returned to California State University, Long Beach and completed his BA degree in Film and Electronic Arts in 2002.[42]

(23 June 1987) Interview of Arnold Spielberg : Conducted by Anne Frantilla at Charles Babbage Institute

Text with OCR - [HI001D][GDrive] / Original PDF (but with OCR) : [HI001F][GDrive]

Interview location : Mission Viejo, CA

Abstract : Spielberg, an electronics engineer and manager in Product Technology Operations for Unisys, discusses product development in the computer industry. He describes his work with RCA and General Electric Computer Dept. in the 1950s; IBM, Scientific Data Systems, and Electronic Arrays in the 1960s; and his work with Burroughs (and later Unysis) after 1973.

Notes :

- F = ANNE FRANTILLA
- S = ARNOLD SPIELBERG
- // = UNINTELLIGIBLE PASSAGE

F: This is Anne Frantilla talking to Arnold Spielberg in Mission Viejo, California on June 23, 1987.

S: Electronics was sort of a way of life for me, because I started playing around with radios when I was about eight or nine years old, when I was living in Cincinnati. Crystal sets were all that was practically available for a little kid. And I always had an interesting connection with Boy Scouts, because there was a Boy Scout who was older than me, and he sort of took a liking to me and gave me an old crystal set that he had. This was about 1926 .. My uncles had just come to this country from China, and they came to the United States through China from Russia. I'll never forget at my house I had this crystal set turr:ied on to a radio station in Cincinnati, WKRC, and I put the earphones on his ears, and his eyes opened wide. He had never, heard a radio in his whole life, you know. I've never forgotten it. So I always was interested in electronics and played with magnetics and made magnets and Erector sets and all that stuff. So in time I became a ham radio operator and that was in 1932 and I used to operate a lot. I was raised during the Depression and I missed college by an inch. So I went to work and I worked for about SE;wen years in the department store business down in Kentucky.

F: In sales, or ...

S: Well, sales, and then I eventually became a manager at the store. And so I learned that business pretty thoroughly. But all this time I was still working witrt ham radio. And then in the service I volunteered during World War II and I was sent to India. And in India I was the Communications Chief of a bomb squadron. And so I picked up some more electronics there. And ...

F: For a bomb squadron?

S: A medium bomb squadron, of B25s. Our squadron was called the Burma Bridge Busters because our job was to destroy the communication lines for the Japanese that were coming up through Burma, to try to invade China from the bottom, and into India as well. So, for a while I flew a combat missions as a radio operator, but then when they found out I could fix radios, they grounded me. So that worked out o.k. And when I came back to the States on rotation, I was able to finagle my way into Wright Field. My brother was a graduate engineer there, working in Wright Field, and he got drafted into the service. And so I took his place, so to speak, at Wright Field. And I worked on developing a radio receiver to guide a bomb. Now that was the first time anybody handed me a developmental program. I didn't know the first thing about how to go about designing something other than one does as a ham,"code your own equipment, you know. I never had a college education, and so it was just hands-on experience and it was kind of fun.

F: What technology does that involve? Was that something new? _

S: No, it wasn't radar. It was radio. It was using high frequency ...

F: Guides?

S: Yes, we used high frequency radio signals at 300 MHertz, and the bomb was guided by five different tones. The tones were filtered out and they in turn actuated a servomechanism which tilted the fins to left or right, or forward or backward, or neutral. That were the five tones. And the pilot sat there with a stick and he watched the bomb go down, and he would steer to left if it was veering, you know, to try to hit the target. And the way a bomb falls, it falls in a trajectory that if you'd fly the plane at the right altitude, you could sort of stay above it, you know, as it goes down and try to guide it in. And it had a technical name, RAZAR--radio and azimuth, range and azimuth control or something like that, I've forgotten. But that was my first experience in doing some engineering, so ....

F: Sounds pretty creative.

S: Yes, it was fun, and I was frustrated for a long time because the specifications that they wanted us to adhere to, you know, were specs I'd never heard of, so I had to look them up. What does microvolts per meter mean, and what's the IF band width, and ...

F: Did most people you were working with know? _

S: Oh, yes. There was a lot of engineers there. It was funny situation, because I came back from India as a Master Sergeant, with no college education, working with Ph.D.s who were corporals, you know. Some of them were pretty mad. What's this guy doing with all this rank here, and no training, and here I am, this hafd-working Ph.D. and they drafted me i_n the army and stuck me right back in Wright Field as a corporal. That kind of stuff. But I got a lot of help and//. And so right after, I decided to go to school under the GI Bill. [...] . So when I graduated [Cincinnati], I joined RCA. I joined RCA to work on television, but they had other ideas and they put me in some radar programs, and I kind of enjoyed that. In 1950 I transferred into a the beginning computer group there. So I really started working on computers in 1950. And at that time vacuum tubes were the main source of logic. And so I did some interesting work with the RCA tube design group in Harrison, New Jersey, because they were trying to design vacuum tubes that would respond as logic elements. They had one tube designed to be a three-input 11and11 gate, another one designed to be a two-input "and" gate, an "or" gate. And I built up some circuits with them. My job was to try to evaluate this and see if they were practical, should they continue with designing of functional, tubes. And a number of us pretty soon came to the conclusion that wasn't the way to go.

F: How much contact did you have with other people in the industry? Were there other people working on the same sorts of problems? Was it ... a kind of tight-knit community?

S: Well, there was a large group of people, and RCA, in order to get started there, was hiring people from all over. Some of their main sources of talent were people from MIT that worked on the Whirlwind computer. Which was the MIT's claim to fame. And there was a bunch of sharp guys, because the group that came together, RCA came out of research and development labs. While the development was going on down in Camden, New Jersey, there was some very original work going on up in Princeton Labs of RCA by a gentleman by the name of Jan Rykeman, who was the man would claims to have invented the magnetic core memory. And there was a big patent ...

F: I thought that was attributed to Forrester.

S: Well, there was a day ... that's right. And there was a big patent battle between Jan Rykeman of RCA Labs and the Hazeltine Corporation which held ...

F: Hazeltine Corporation?

S: Yes. For they claimed to hold a patent, and the two patents were right on the edge of contention. And I think J. Forrester won on that one. But I thought Rykeman was as much a contributor to that invention as Forrester, because they were just running parallel. And at that point in time I became a supervisor, and I had a very smart young guy that I sent up to the labs to learn how to make magnetic cores. We pretty soon came to the conclusion after this early vacuum tube stuff, that vacuum tube functional elements, that we would use vacuum tubes as drivers and use diodes for logic, although we had a contest, so to speak, whether we were going to build computers out of magnetic elements or diodes and logic elements. And the industry went diodes. And so that's where we went, too. Then I got , involved with the Bizmac computer and my first job there was to design the arithmetic system. And then after that I was responsible for designing a data sorter-merger-extractor, a wired program system, because they didn't use stored programs on that. They kept the stored program concept for computers and we did wired logic, were doing special functions. So this is a huge machine that would fill this room. And the purpose was to take data on magnetic tapes and sort it, or to extract information from magnetic tapes, or to merge data. **And this was all in response to a contract that RCA had with the Ordnance Tank and Automotive Center to design a computer system for handling the ordnance operation.** And it was in Michigan. And it was a lot of fun. I learned a lot there. A lot of us had a lot of opportunity to write patents. I must have about 1o or 15 patents in my name for all kinds of computer logic and systems . Then after that program got launched, since I was in the Advanced Development part of RCA, I got a very interesting program, that was the design of point-of-sales unit for a department store. We worked with an associate merchandising corporation and they were interested in sponsoring someone to develop an electronic cash register. And I got , picked for that project because of my department store experience. So I was able to be very conversant with department store managers, and, as a matter of fact, I think that was one of the best planned systems, despite the ancient technology we're in now.

F: Would that be something that would keep track of inventory?

S: Yes, it could. I'll just give you a brief outline of what its purpose was. The first thing was designed to capture data at the point-of-sale, like you see in any store you go to now. What we did was make a mockup and went to about six different major department stores throughout the country and set up--what you might say , operating environments, where we'd have sales people ring up sales on this mockup machine, and then critique it, and we had buyers critique it

might say-- operating environments, where we'd have sales people ring up sales on this mockup machine, and then critique it, and we had buyers critique it, floor managers critique it, and we took elaborate notes. And then went back and incorporated this in an overall system design. And the overall system was designed to have multiple cash registers feeding into a central computer. And then the central computer in turn produced data on magnetic tape, which was in turn carried over to the Bizmac computer which was the inventory control computer. So the purpose was to capture data at the point-of-sale and then use it to modify inventory records, so as the store would have a current status of all their stock, and a current status of the sales activity.

F: Sounds like a pretty advanced .. .

S: It was. As a matter of fact, it is ... there's very few changes in the current system of point-of-sale operation that we didn't conceive of at RCA, including reading merchandise tags, including checking for bad credit and having a list of credit people on the drum. We used a big drum for the storage of information.

F: You know who made the drums?

S: Bryant, in Walled Lake, Michigan was the original. That drum was about 16 or 18 inches in diameter and about 24 inches long. It was huge drum.

F: Burroughs, I know, used some in the sos that they bought from the ERA.

S: Yes, that's right. The ERA was a good drum maker then. Well, Bryant was a maker of high-quality bearings and machine tools. And we felt that they could engineer a drum that would spin and hold its own, and what problems we had were usually-metal expansion, all that stuff, which was a pain in the neck. But we had it working. I have some pictures of my · collection at home of those earlier systems. · But the sales recorder, they used a computer, and it was one of the first times that I've ever known of, other than John Wilkes in England, that anyone built a micro-programmed computer. This computer we built, the custom computer for taking all the data of the sales recorder, was a wired micro-program computer, that is, we used diodes to set up the micro-steps, and we had a counter that stepped it along, and tor multiplication would step along feedback step-along. Feedback is your repeated additions and shift, binary type multiplication. So we literally had a micro-programmed computer, but not like the current technologies, which is stored in RAMs and ROMS. But the concept is similar. That's what I meant by this business_ of ideas re-occurring and re-occurring and re-occurring.

F: Did you get other contracts from that?

S: No. What happened was we did try for a lot of contracts. We went to the military, we showed them that we could automate logistics centers at the various Air Force bases. But the problem was very fundamentally that the system was too early. We didn't even have transistors in it. It was all diode logic in tubes. This was done from 1954 to 1956, and the mean-time-to-failure of that system when it was installed--it was installed as a test system in Higbee's in Cleveland--and there was 10 point-of-sale units in the sportswear department feeding the recorder's Central, which was the name of the supporting computer. And it usually would stay together for about eight hours and then it would go down. And somebody would be jumping out to fix it, so it would barely hold together for the day and then the technicians would pile on it at night and try to get it back to life again . .

F: There must have been some sort of backup system with it.

S: Nope.

F: During the day if it went down they couldn't make any sales?

S: When it went down, they had to go use hand cash registers. They left the regular cash registers around. So after a year of trial, they concluded that functionally it was a good idea, that functionally it would work, but that technology-wise it wasn't ready. And so RCA ate a couple million dollars worth of costs there, and so did the associate merchandising corporation. And they said, o.k., end of experiment, end of program. Now, a lot of the people that were on that program went to different companies. Some went to IBM, and IBM set up an operation in Rochester, Minnesota to continue to examine systems using point-of-sale. And some of the original RCA guys became part of that and I ran into them later when I joined: IBM. And, matter of fact, they asked me all about it--early days. I left RCA in late '56, early '57. I joined the General Electric computer department. At that time the computer department was called the Industrial Computer Department because Ralph Cordner said, "You will not join the business, making business computers. I will not allow that. 11 And every time a plan was sent to him that mentioned going into business computers, he would would write "No" across it and send it back .

F: What was his reason?

S: His reason was that. General Electric is an industrial company, and if you want to make computers, you can make them for the industry. So there was a sharp guy by the name of Barney Oldfield who was head of the Microwave Lab, and he set-about to, somehow to make this happen. And he convinced the Bank of America that General Electric could build the IRMA computer that the Stanfdrd Research Institute (SRI) was designing for them. So, after several under-the-table operations in which he had some pretty good names associated with the company, like Dr. Herb Grosch, Dr. Bob Johnston who used to be//, was part of that team. And they hired me to help set up the Industrial Computer Department, because that was the banner under which we flew. But in the meantime, they did seti the Bank of America the concept of building the computer, and GE launched into the computer business despite Gardner's statement that he wouldn't. And so when they were recording the story, when they finally dedicated the first computer, Cordner came out to attend the dedication ceremonies and promptly fired Barney Oldfield right after the ceremony, for violating his rules. And he gave the company 18 months to get out of the business. You know, gave them II. And there was only about five or six people that knew about that. Certainly not me. But I remember working on a computer for process control, that another guy and I went to the general manager and said, "Hey, we can put a memory in this thing and now you've got yourself a business computer. So II we did it. And that got him started. That became the GE 225 and 235 which was, well, they were both successful computers. I really didn't find out about all that high-level machinations until I went to the GE reunion, where some of the guys that were involved in that spoke about it.

F: Whatever happened to the Bank of America contract?

S; They shipped about 18 or 20 systems. They were problem systems, but they worked. And we got our data sorters, you know, check sorters, from National Cash Register, who in turn got them from II Pitney-Bowes, I believe, was the original developer. In the meantime, Burroughs was doing their own ...

F: But the check sorters that we used came from National Cash Register.

S; I didn't know they made them.

S: Well, they actually had them made by Pitney-Bowes, and then modified themselves, and GE finally made their own. But then they really lost the banking business because--a lot of things I wasn't totally aware of, but-while their product planning was not well directed, they came up with a middle-range product that I started, called the 400-Series of the product planning I I decimal machine, something like our B.;Series. But it was not competitive, it was priced too high, so it didn't succeed. And then they came out with a 600 line which was pretty good. But by then they just decided to work their way out of the business. And a lot of people thought they lost a lot of money in the business, but as I understand it from some of the people that were involved in finances, they really

didn't lose much money on it. At least that's the story I heard. So when they started to ease their way out of the business, that's when I left and went to IBM. And I joined IBM in 1963 to work on process control--computers. IBM was just really starting to get into process control. And again, one of the guys that got me into IBM was a fellow that worked with me at RCA. So there's again the old IBM community of people. And ...

F: How was IBM perceived within//?

S: How was it perceived? It was a top company. This was, in '63 IBM was a league leader. They were in business computers. They decided to get into process control and they adapted an old machine called the 1620, and they repackaged it and called it the 171 o. But it really didn't cut it. They installed a few because they have such a tremendous sales force, that they put a few in some paper mills and a few in some// to do some data logging, but then they started programs that would come up with a new one. And that's where I came in. And thts new machine was not well-conceived because the people who put the system logic together came out of the business computer line and their goal really was not to make a process control computer, but to make a small business computer. And since they were funded from the process control line, they gave lip service to process control. It was typical politics. So when I took a look at that computer, I say, "My God, this will never work in a process control world!' And so, this fellow who came with me from RCA, John//, and I sat down and designed a machine that we thought would do the trick. And we presented it to management and they bought it. And I ended up being responsible for the design of that machine. And the result that was called the IBM-1800. But the guts of the machine were then flipped over and used in the 1130, which was a very, very popular IBM small business scientific computer, and it replaced the 1620 which by then had died out in terms of the market, in the market.; So the 1130, I guess, over its life sold about 15,000 or 20,000 machines. And the 1800 process control computer sold about 82,000. In both cases they met their forecast. The real problem with getting into process control is the same as it is in almost any company--the marketing end of it. To sell computers in the process control industry requires a lot of custom design because each of the processes have different technologies, different sensors required. The front ends are the most complex part of the system. **So when I first started working on this system, I spent at least three to four months writing specifications for what the front end should be, based on my experience at GE.** And there were a few good guys at IBM that knew that industry, and so we put our heads together and got a fairly good specification written, and then part of it was built up in Rochester, Minnesota--the high-performance analog-to-digital conversion stuff was built up there. And the low-level work and the main processor and all the peripherals and all the peripheral controllers were built in San Jose, were under my control. And so it was a very intense work, because anybody who says that things are taken easy at IBM is wrong, because I used to come to work at 7:00 in the morning and work until 6, 7:00 at night and come in and work on Saturday, because what' happened was when they decided to put the new computer in, they didn't want to change the schedule. So we literally had to discard the first system and start over again and still keep the same schedule. And it was almost like an impossible thing, and yet, in a little less than two years, we designed a machine, built the first prototype, built the second version of it--you know, called the B-level, the first was the A-Model and then the B-Model--and we were just ready to release the C-Model to Manufacturing when I got an offer to be a Vice President in Scientific Data Systems, and I said, "Goodbye, IBM." And so I went to work for Scientific Data Systems in Santa Monica.

F: Was there any project that was competing with the one that IBM--the one for process control?

S: The 1800 was a, what would be considered now, mini. But in those days it was a small, medium-sized computer. Small-medium range. And the systems that were similar to it in performance characteristics were Scientific Data Systems' 900-Series--the 91 o, the 920, the 930--were a competing level of machine. Except they didn't have process control front ends. They were designed to be used in the small scientific and in downrange missile stuff. They did have some special front ends for them, but they were directed at missile simulation, missile data analysis. And that's one of the reasons I guess Scientific Data Systems wanted me-- because of that experience there, and also the previous experience at GE, plus several of the guys from GE went to work at SDS while I was at IBM, and said, 11Why don't you get Arnold? 11 That kind of stuff. So the other competitors to that machine were TRW, the RW-300, that was a little bit earlier machine, actually. And Daystrom had a machine that was--it was a good machine, but they never could market it right--they were always selling at such a low price that they really couldn't make any money · off it. And IBM's marketing force just overrode a lot of people. And also they had a shrewd piece of marketing concept: they did not try to use the computer as a process controller. They used it as mostly a data logging system. And they also incorporated a lot for factory record, data gathering, parts counting, production line control, production line data logging. Every place they could apply it to a data-logging operation, they would not then get committed to run a process. And it's easier to sell in that marketplace. You can build a good base of business, and from there they can grow. After I left IBM they started a System 7 which was their next generation processing control, but I was no longer involved in that. And I don't even know what happened to it, or whether it's still active or not. I know that while I was there I was often questioned about the point-of-sale system because IBM was doing some planning along that line. // they were very careful not to ask me about real trade secrets.

F: I don't think that would be true today, do you?

S: I don't know about today, but I know then they had a man in charge of, you might say, official information gathering. But when I left GE I had to sign all kinds of disclaimers I wouldn't give out any information. When I entered IBM they said, 11We don't want to know anything about what you've done specifically. 11 So the questions they asked me about sales recorders, pointof- sale systems, were not how I built it, or how it was built, but what were some of the concepts in terms· of application orientation. That's fairly open. But that was kind of interesting. I stayed at Scientific Data Systems where I was responsible for the whole 900-Series and then the Sigma-Series. The Sigma 2, 3, 5, 7. We were working a Sigma-9 with the French company. They would paying for a lot of them, and that's when they sold out to Xerox. And at that point I left and decided to go with a small semiconductor company called Electronic Arrays. That was a mistake. They built MOS semiconductors up at Mountain View and they asked me to be a Vice President of Operations in Southern California, in the L.A. area, actually out in the valley, to try to get them into the business of applying their MOS technology. So we had a few small contracts, but the company was very underfunded and the president was a guy that was so wrapped up in semiconductors, especially so wrapped up in MOS, that we had to build all of our systems out of the MOS technology that was coming out of the mountain he planned, even though the costs were so prohibitive that we couldn't make it for a profit. And even though we wanted to use TTL, he said no, we got to use MOS. And he would come up with a logic family of MOS technology that was like the small-scale integration right now. Very small scale. But it was too costly in terms of the number of gates that were functions per dollar. So, while we shipped about 40 or 50 of those systems, the company eventually--well, it was MAI--that was Management Assistance, and they did maintenance and they also did a few products of their own. And their job was do a lot of computer maintenance, or contract maintenance. So we built this IBM controller for them, tape controller, and then when they canceled the contract, fortunately for the company we had a cancellation clause, we collected a million dollars on the . cancellation clause. We used that to set up a calculator company, so I had to write the business plan for a calculator company, and we set up and manufactured a four-function calculator, a printing calculator, and then we had two others planned. And that was my first experience in applying MOS into calculators. And at that time we sold a lot of chips to the Japanese, which, instead of buying from them, they were buying the chips from us. That was rather interesting. And this was in the period of 1969 through 1971. '68 to '71, that time. And then the company really got into trouble financially. We sold the calculator operation to a sort of a broker who tried to complete the line and then he ended up getting a couple of good contracts to make some more calculators. But what had happened, the prices were going down so fast that it was difficult to keep up with it. Our original plan was that the calculators were going to sell for $398.00--for a four-

function calculator.

F: Wow!

S: Well, that's what they brought. Our plan was the next year they'd go to $298, the next year $198, the next year to $100. And it came down even faster than that. So the price just shot down, because the minute Jhe Japanese got a hold of it and they started putting high production techniques in it, the first calculator would have five chips, the next calculator was designed to have three chips, and of course pretty soon they were down to one chip. So that was a// adventure that got me experience in doing plans, and setting up a small business within a business, and so was the whole small company a business, because as a Vice President I was laying out printed circuit boards, you know, in the beginning, when there was only about 10 people in the group. We used to do everything. After leaving Electronic Arrays, I went into consulting, and I did some consulting for SRI, and for some small companies that needed systems and procedures working, and some technology, evaluations and things like that.

F: You had no problem getting work?

S: It was a bad time then. I would say I was about 35% busy and the rest of the time just messing around. And then Dr. Bob Johnston had a party one time. He found out that I wasn't doing anything much. He said, "Why don't you come to work for Burroughs?" And so in 1973 I joined Burroughs as the Director of Engineering under Lloya~ole~~) And for the first--oh, I joined him in April of '73, and then until September I spent my time out here in California helping the Galicia plant, going through some of the rough starts on getting the 1700-line. That was under Rod Bunker then. And I worked with Dean Ernest and some other guys, that we were just trying to see if we couldn't get the product cost down, because the 1700 was promised as a low-cost machine and it came in pretty high and it took a lot of effort to kind of re-direct it to get the cost down, but never down to the goals.

F: Well, it was definitely one of the most successful product lines ...

S: It became a successful product line, and yet initially it looked very sad in terms of cost. But I guess marketing handled it o.k. And after there I moved to Detroit, and I was involved in all the plans then under the Computer Systems Group. And I was in Detroit for about two years when the DC&L program started. That was a mistake. We involved way too much . of the company's product plans onto a technology that was (how shall I call it?). It was best labelled experimental in the beginning, and it looked like-- as a matter of fact it had promise. It did have promise, and if we'd have picked maybe one or two products and said let's use these as the target products, we wouldn't have gotten management so nervous about committing all this money and all the programs to a technology that was still evolving and still had a lot to go and had a lot of cost.

F: Is there anyone group or group of people that sort of were pushing for that?

S: Yeah, the focus of the push was really two places--at the senior management level it was under Dr. Bob Johnson and Herb Stopper. Herb really did a lot of the conceiving of the function of the circuit system. The Rancho Bernardo plant actually did the implementation of the BC&L technology. The packaging concepts were worked out in Tredyffrin under Sid Einhart then, and I think if we had stayed, "Let's build the machine in Tredyffrin and no place else, we'd have had a good chance of success because that machine was big enough so we could have absorbed some of the cost of the water cooling, the liquid cooling,//, it exceeded its cost objectives it would be like the 1700 was. It exceeded its cost objectives a lot, yet it became successful. Another problem that happened with the product is there was a lot of problems initially in the technology at Rancho. And so this kept delaying the product coming to the marketplace. And so what happened was the technology became older without seeing the light as a product that brings some return to the company. Also, the signal level that was chosen under the emphasis of Dr. Stopper, was incompatible with the other ECL technology that Fairchild was sponsoring and that Motorola was working on. So we had no way of rescuing ourself by saying hey, let's grab some ECL from Motorola or from Fairchild and fill in the gaps and make a system that could have been compatible in that sense.

F: You mean technology was changing increasingly fast, or do you just think it took an extraordinary amount of time to get it ...

S: Yeah, but you see, that's true even now. But now they've really cleaned up the art of having very high density VLSI technology. They also have now cleaned up the design automation methodologies for laying down, you know, defining the patterns. In the early days the DA was crude. A lot of stuff had to be laid out by hand. Gate arrays were just beginning to be ...

F: Gate arrays?

S: Gate arrays. That's the concept, instead of doing the design of a chip exactly customized to the function that you want to do, you have an array of gates that can be interconnected to make the logic. But the array is a fixed pattern, and then you just configure it to the logic that you want. And some of our ... well, matter of fact, the A-3 is built of gate array type logic. The A- 1 o was built that way. A BCL, the A-9 was built that way, and the concept of having quick turnaround custom circuits just wasn't ready. But now with the silicon simulation technology that they have to go to simulate circuits using high-performance systems, you can have a much faster turnaround. And thus you can go back to some custom circuits. In the meantime, while all this was going on, the computers on a chip, you know, while I was with Electronic Arrays, Intel was beginning to work on the 8080, or the earliest single-chip computer. And as a matter of fact, speaking about rock, I proposed to Electronic Arrays that we build a three-chip computer, a computer chip, a memory access chip, and an 1/0 chip. And they said, naw, we don't want to do that. And it was about the same time the 8080 was coming out, I heard Dr. Davidow // at Intel. So I often thought, gee, what would happen ... we never had the money to do it, though. Forget it. We were so lightly funded that probably it was a good decision not to do it. But on the other hand it was a shame. We would have flunked because we would not have had the money to put into it. So in working on CML, it was a frustrating job because there was a tremendous controversy about using the program. This plant in particular, but then engineering manager, Irv Houk absolutely did not want to use CML. He was probably right, in retrospect. The A-9 program shoved around from one technology to another, trying to meet everybody's various pulls and demands as to what the machine should be. You start off as a CML machine, then they said let's do it on a PTL, but that wasn't enough performance. Then it was back to CML again because it wasn't enough performance. Then they proposed the F-100, Fairchild ECL technology . That one finally came out to be. But that cost about three or four years of //

F: I could be wrong, but wasn't the company doing very well in the '70s? I mean, it looked like that's when it started being really profitable. Mayo~ it's more toward the end of the '70s.

S: Well, more toward the end, yes. And also, recognizing the fact that CML was not going to make it, Bob Merrell was then the vice president, started a bunch of programs using PTL technology. They redid ... they gave up on the CTL technology. They redid the 1800, the 17 series of// in PTL. Then came the 1800 and 1900 series. They started a PTL program here that became the 5900. Pasadena continued evolving out of CTL into TTL, and so TTL really became the rescuing technology. And then Rancho Bernardo sort of sunk into limbo for a while. And there was one successful machine that opened out of BC&L in Pasadena, and that was the 4800. It was made out of BC&L-zero. And it exceeded its cost, but it had nice performance. Then there was another machine built out of BC&L-zero at Liege which was a 1700-style machine, but built at Liege out of BC&L-zero. The BC&L-zero was packaged in a conventional package

out of BC&L-zero at Liege which was a 1700-style machine, but built at Liege out of BC&L-zero. The BC&L-zero was packaged in a conventional package. Instead ofa liquid cool pack, it was an air-cooled system. And so it didn't suffer from the problems of trying to make it a good packat)ing technology with liquid coolant work. And now there's some of the people who were early proponents of the liquid cooling have come up with a much nicer package down there at Rancho. Gunther Weber's//. And what happened with me is, after the CML fiasco (I might call it that), I officially transferred out here because my exwife did not want to live in Detroit any more. So I stayed here and worked on it. Then I went to work in this plant in Systems, and then gradually evolved into an Activity Manager and put together a graphics program.

[...]

F: Did you think it was frustrating for people working on CNL?

S: On CNL?

F: Well, it doesn't seem like overall the company lost that much. They sort of rescued themselves in time.

S: Well, they did rescue, but in reality, we delayed our entrance into the VLSI field by at least three years. I would say we could have been into the VLSI fiel"d sooner had we had a little more focus and more development without commitment. In other words, if we had put one product together and looked at it, we could have learned from it instead of diversifying--not diversifying--diluting all the skills and trying to cover a whole bunch of bases, and not succeeding at any ...

F: All right. Talking about who was arguing who, doing what, in terms of BC&L or not, what groups do you think had the most input. There's marketing people and legal people and engineering people.

S: Well, the market people, in all honesty, I think, really, didn't really know whether the technology was ...

F: Did they have a say?

S: Well, Product Planning was then under Fred Meier, you know, was concerned that we're not getting the objectives. You know, he looks at it and says, "Where's my results? 11 And the results weren't there. So obviously he became sour on it. Bob Merrell at first was for it and then against it, as he saw nothing happening. Bob O'Connell, who was head of the semiconductor group, was trying to make his group do it, and of course there'd be head clashes while they tried to straighten each other out. And the net result was finally the company said, "Let's go.""

F: Was the top-level management?

S: Well, gentlemen like Paul Mirabito were really at the mercy of his people who were giving him good technical advice, imaginative advice. But after a while he said, I'm sure he saw// 'we're not there yet.' And unfortunately Herb Stopper was a very convincing talker, an extremely brilliant guy. I used to work with Herb at GE, so I knew him before he came to Burroughs. He was in our group at GE. And he's an extremely bright guy, but extremely stubborn. And he had the concept that anything he says can be done, anybody ought to be able to do. And so, he never put a product down in the marketplace. And so he would come up with absolutely correct theories, but the implementation was tough, and he'd get totally impatient when it wasn't happening. And he'd start clamping down on people. And Bob Johnson supported him on a lot of that, although Bob's a very sharp engineer also, but also a guy who never really put products in the marketplace personally. And there's something to having your hands dirty and completing a program and making it into the factory and going through the nitty-gritty of getting a product through the manufacturing cycle that is a very--how shall I call it--leveling type of experience. You say, boy, Murphy's Law works. If it can go wrong it will. And you start to work on problem-solving those problems. And unless you carry that out and have some of that under your belt, everything looks ethereal, looks like it can happen. And then you get rosy glasses. And that's a lot of what happened in the higher level there. There was some rosy glasses at the corporate level of engineering, I think, and some insisted that yes, it can be done. And then at some of these big meetings we have at Detroit, stop work put up curves. Yes, the cost can really be here. It can under ideal circumstances, but not under the.practicality of what was happening at those times ..

F: It seems like such a complex thing.

S: It is. It was a very complex ... and the industry has matured now and now we know how to do it. And things that seemed to be ... that were very difficult then are still difficult, but the technology is here and the tools are here and the design automation is here an~Jthere's maturity in the thing. And we were on the forefront. And when you're on the forefront it's not too hard to slip. And it hurt me.

F: // It's hard to work on a project that doesn't.

S: I got a kick in the butt for it, too. Somehow or other I should have made it happen. That's the job.

F: Someone's got to be the fall guy.

S: Well, a fall guy or what. A number of us took a beating and I was about ready to quit. But then I said, naw, I ain't going to do that. I'm going to stick it out and show them I can do it. And that's what happened. And so now, well, we'll talk about graphics now, because what happened was the company had decided that it would be a good idea if we had some new product avenues. Graphics, according to the corporate product manager study, was an evolving, an emerging, field.

F: Do you think they're correct?

S: The company was correct in saying graphics is emerging. The company was correct in saying it can be a business. The company is correct in saying that it would complement our product line. What was wrong was that there was no real training in marketing, in how to sell it. It's such a new concept, and it's a technical concept that has to be sold. And you were not going into the front door to your DPO, operator of data processing operations and say, 11Hey, I'm gonna do more business for you. I'm gonna give you a more efficient machine now. I'm gonna crunch the numbers faster for you, or I'm going to do your banking faster," or what have you. Instead you say, 11I'm going to give you good reports. I'm going to give you graphic illustration of your data. And I'm going to give you publication quality of all these slides that you can make presentations with. 11 And so that was the marketing end of the thing that really need to be grown.

F: It was kind of before its time?

S: That's A. The company that we selected had a good product, but the product was an older product. And it was at the highest end of the graphic performance line. It was designed to be a high-end system producing very, very high resolution graphics. Very high quality. The software for it was very user-unfriendly. And unfortunately, initially enough of us did not know enough about graphics to know just how unfriendly it was.

F: It's probably a whole different ballgame then ...

S: Well, we began to learn as we got through the program. We began to see that this interact program that was sponsored by E. N. Herschel, who was the then-president of Superset, was a clever program, but it was designed to be run by a Ph.D. And when some of our programmers got hold of this, they said, "Oh, my God, this is user-unfriendly." And we tried to convince them to change it. And we couldn't. That's one. The other thing is the product cost and the market price we could sell it for were too close to each other. And the way Burroughs does business is, we lump in all the hardware support, and we lump in all the development costs as preproduction costs, you know. And that added to the whole cost transfer price such that the costs were too high from the profitability point of view, particularly since the volume forecasted was low. When I first started the program, I suggested that we don't even build any more plants. We take a small group of us and move us right down to San Diego, move into an adjacent building right with Superset, we set up a small manufacturing operation that has low overhead, and we can produce it, and top brass said, "No way. That's not our way of doing business." And I still think I'm right, you know, because subsequently large companies have set up what they call tiger teams that are put in a little building and go off and do this. I mean, take away the pressure and you just get this done. And that's what we really wanted to do. We wanted to set up a little tiger team and go out and do it. And so, as a substitute for the tiger team, we set up a plant within a plant in Pasadena. They decided this plant was too busy to make it. Ed Nelson was overloaded. They'll put it up in Pasadena. So they created a plant within a plant and· had a program manager. And they gave it relief for one year in charging into it all the high cost of the overhead. So that brought the cost down. But it was an artificial bringing down because they redistributed the cost to other products within the Pasadena plant. You can't get something for nothing. If you got n people there, the money's got to be charged some way. Well, they decided they'd do a favor for the graphics program and not charge it. But so the other products ate it. But that's life. We had a very good team here in putting this product together. We had a very good program planned, but the budget was always at the bottom end of everybody's desire. So when this plant was given budget money, they were given budget money for all the mainstream products and I got what was left, which wasn't enough. And yet it seemed like a lot of money, and the reason it seemed like a lot of money is if you don't sell many, any development costs a lot of money. So it became a circle. And the interesting thing about all this in retrospect is after we canceled the program and turned the work back over to Superset for a while, until it was completely canceled, we had the program here, and then turned the work back to Superset and said, "O.k., you've got a lower-cost operation then. You do all the work." The marketing was still not selling enough, and when I talked to Dr. Stern, as I went back to the stockholders' meeting about three or four months ago, and Fred Meier introduced me to him as a man who helped get the GP-2000 started, so I said, "Well, just at the time when we had decided to kill the program, orders were starting to come in." Now what that does, it ties back to the concept of how you really have to develop a sales force to sell it and it takes time.

F: You also have to work in tandem with what's going on.

Well, there was only two people in market planning to work on this. One guy in product planning and one guy in market planning. And they were fellows who never had experience in direct brand-new program introduction. And so, while they tried hard, it was very difficult to get the market people to make a decent forecast. First the forecast was real high. Then when it came time to cut the mustard, down went the forecast. Up went the cost. The cost forecast played reverse roles. The higher the forecast, the lower the cost. The lower the forecast, the higher the cost. Both are self-fulfilling destruct prophesies. And the lesson we learned out of that, and we're trying to pioneer, is to help marketing get started early in a new product program. I remember giving several talks here at the plant to our other activity managers about the experience we had on this program, the idea being to help look for advance clues as to how we can help marketing introduce a product, help get training across, help make the product palatable to the salesmen so they can sell it.

F: You know, some of that sounds familiar to me as some marketing problems they haa when they were doing the B-5000. That was part of it, that the salesmen didn't really know what they were selling. The customers didn't know what to make of it, so ...

S: And they didn't know how to sell the graphics programs either.

F: It's kind of similar.

S: And now I think graphics is a really fascinating industry. An ir,tteresting sidelight--1 was over to Steve's house one day and George Lucas was there. This was about three or four years ago. And Lucas had this company making the very highest level of quality graphics, and they were using it for animation. And he was trying to help organize a company under his name. I said, "Hey, George, what are you going to do with that company?" He said, 11Arnold, 11 he said, 111 don't know how to manage that company. I'm going to sell it." And he did. He sold it off. It was just too new for him. It was too different. It didn't fit under ILM, the industrial lights and magic. It had special effects. Because it was prohibitively costly and to get a really good animation into a movie, you almost needed a Cray computer to crank out the data. Now even that's being helped, because now the industry, like Tl especially is coming out with custom chips that are graphics-oriented chips. They're designed to refresh the tube real fast, refresh the screen, refresh the memory real fast, do bit manipulation, picture manipulation, pixel management that they're all customized on a chip. So you can put a system together that works fast and it's cheap. And so what's happening is the graphics industry is becoming driven now by PCs, except for the very high end. Then they really need big computers because you got so many pixels to manage. Now I'm running a mundane program but necessary called . Engineering Reso.urces. ,And we have a lot of things to do here. I don't know hdw much you want to go into that now. It's not really an archival thing--it's a current project.

F: It sounds like you're sort of involved in different aspects of projects over the years. You could make comparisons like between how equipment was tested over the years.

S: Well, for example, most all the early equipment, the '50s and '60s were all hand, manually assembled, hand-wired, soldered, and very complex back panels, large panels of logic, of plug-in ... one functional element was a package about six inches by six inches by two inches deep or I think it was something like that. It was a logic// couple tubes on it, some resistors and diodes and that's a flip-flop. Now a flip-flop is so small you can't even see it. That's one. In terms of the ... the assembly methodologies went from hand-soldered to wire wrap to etched back planes. I'll talk about the back . planes. The etched back planes reflow soldering, which means you don't have to get a new head, just put solder mask on there. I mean solder array //, then either reflow solder or air heater. And then make the connections that way. Patching gets denser and denser and denser. Layers get thicker and more and more layers o.f interconnect. A back panel used to be a layer of wires criss-crossing, then the XV edge, then multi-layer, you know. And that's where we're at now. Multi-layer back planes. And then mounting techniques were originally everything was socketed and then everything was soldered in by soldering by drilling holes and plate through the holes and putting the components in. And now surface soldering is coming in because it's more compact. And each time you advance that technology, the tools required are more complex. Surface ~o_ldering is complex ~n_d also ~he field repair poli<?Y is changed. It used to: be that a guy would go out in the field, unsolder the wires and take the transistor out, put a new one in, and solder it back in. And then a chip would be unplugged, and assembly of componentry. And now the whole board is changed out And that means everything can be repaired faster. And since computers are taking less and less space, a board becomes a more, a larger and larger significant part of the system. So the cost of spares are going up, because you can't stock a small component--now you stock a board. And more and more each board becomes a custom board. So often the spares are equal to cost of the machine. For example, we have an A-15 here, and a set of spares for the A-15 is a quarter of a million dollars. That means you now have a new logistics. You'd better make

the machine last a long time, so that the reliability is way up there so the need to change out is small. Too, you better have a fast way of getting spares to . the spot, because no customer is going to be happy with a machine down more than half an hour. Or an hour at the most. Or they start to scream .

F: Do you think reliability is improving?

S: Definitely. In our future machines we're talking about reliabilities of over a year. And mean time between a system halt of longer than a year. Now when I was in Process Control, they wanted us at first to achieve a 99% up time. Then they raised they the jumping bar to 99-1/2% up time. Then they raised--about every two years they do this--then the next jump was about 99.8 up time. That's asking a lot. And our companies then would not agree to redundancy in the systems. I often proposed, particularly for nuclear control, a dual system. The military and space program often has three or four systems, all sharing the function, you know, and if one goes down the others take over. But the cost was so much in those days that they couldn't have the redundancy that they needed. So they used to talk about having redundant circuits. They tried to come up with circuit systems that would path A, if it would quit, path B would work. And very few machines were really built like that. But the most popular machines in the current marketplace are like tandem that have dual systems tied together. But what's happening is I think tandem's even going to get by-passed because of the increased reliability of very large-scale integration. So putting a machine together with very few soldered parts, you know, very few plugs, every time you make a connection it's a reliability focus point. And so the more you reduce that, the longer you can bet on the componentry lasting. And so we're committing ourselves now for future products to come out in the very late '80s to be in the one-year reliability range. That's pretty good. With 24-hours a day running, there was over 8,000 hours . Now that doesn't still hold true for some of the physically moving peripherals. Disks are getting lhat way, though. Disk technology is getting way up there in the $50,000 range, and that's a lot. You have to figure something drastic right there. Now, as far as testing things in the factory is concerned, early testing was by oscilloscopes and probes. You looked at pulses and you looked at the wave shape. You said now that's o.k. or it's not o.k. or something's missing here. So scopes and probes and brilliant engineers helping the test technicians on the floor how to test something. And also in the early systems, because componentry cost a lot of money, you tried to design with the fewest number of parts, and particularly, you tried to design with the fewest number of flip-flops because flip-flops are considered to be unreliable. So that perforce the logic became very complex, the system logic became complex in terms of you would take the same data and you'd use that .,. . qr rather take the same path, try t9 put different pieces of data througli the same path at a different time sequence, so tracing a fault, you had to know where it was in the time sequence as well as what path it was going through. Nowadays, with componentry costing less, you will to be redundant; you're willing to make a once-through path in terms of making the system easier to check. Furthermore, you now put probes on the end of cards, you know, so you can test the function. You have diagnostics that are getting better and better and betters so that you can exercise the machine with diagnostics more exactly and D-drive and other test techniques like that are homing in on individual parts. But now we back away from that somewhat, because now it's necessary just to show that card is bad. As far as the field is concerned, you can just pull the card, swap it, send it back to the factory where a different level of diagnostics can be used, to home in on the particular parts that are bad. The next thing that's happening, and it. actually was happening at IBM . when I was there, is the beginning of use of robots to test. Instead of putting peripherals on the line to test the computer going down the line, they'll find a functional robot that will simulate the peripheral, and especially for a high-volume production, just plug the robot into the output and it runs through a whole bunch of exercises// on the tape, I'm running like a tape, or acting like a printer. And we're talking about that now. Also, a lot of peripherals are disappearing from the scene that used to be electromechanical, like card punches and card readers, and paper tape readers and paper tape punches--they're all passe. And once the main elements of storage, disks, magnetics, magnetic disk, magnetic tape, magnetic cartridge, CD-type things, laser, laser-read, laser-written, these are all very reliable technologies. And what's coming to the front is distribution of data. So datacom is becoming more and more important, the need for long-distance communication, the need for terminals, so everybody's remote to the host. So datacom is becoming a larger and larger portion of the peripherals that are attached to a system. Highdensity storage, archival storage like tapes or CDs, terminals driven from concentrators and high-quality datacom subsystems is what a system is evolving into. And graphics next.

F: Talking about the telecom, datacom elements, it seems like products within an industry are becoming more interdependent upon each other. Like the new contract they did with the graphics company you were talking about. I don't think in the '50s companies really shared resources to come up with a product.

S: You mean, are we as much vertically integrated as we used to be? Do you know what I mean by vertically· integrated?

F: Yes, yes.

S: O.k. Yeah, plants try to be vertically integrated, but every now and then well we got smart. We have probably admitted we don't know how to make a good disk. Well, we don't know how to make a good magnetic disk system, and so we buy them. We don't know how to make tape any more, so we buy them. Or, put it another way. A specialty company has passed us up, so it's now more convenient and better business judgment to buy the technology from them. So we've become more and more an assembler of componentry and there used to be, early on, early discussed, I remember having sat with some of the people with Intel. They, remember (no you can't, you wouldn't understand}, you know, if you will turn over the development of this or//, the people let us do their system for you, we'll deliver yo_u a systems on a chip, you know what I rnean? And Poleski ~as then president of SDS, said, 11No way! You're not going to take away my prerogative design, my kind of computer, you know: 1 But yet 8086, 80386, the newest ones, those are now forcing companies to use that processor in their application, because somebody just concentrated on that. So you might say the semiconductor people are slowly stealing pieces of the show. On the other hand, the name of the game now is the application software, the business end of it, and that's where the companies ours will continue to shine. We just have to strike the right balance, what we buy and what we make. And so that's what happening. The industry is evolving into ... every time there's a new step in the technology, it creates a new set of balances as to how you deal with it in a business sense.

F: It seems like in the early days that it was more possible to trace products by the contributions of specific individuals, whereas now it seems to be almost impossible. You know, people change jobs so quickly and departments are so big. I don't know if it's because the technology is not improving dramatically, like it did between vacuum tubes and transistors. It's harder to trace product developments to specific individuals.

S: Yeah, I agree with you. And yet there's always some genius somewhere that comes up with the unusual break. But by and large, most of the engineers working in this place here are not inventors. They are applyers. That doesn't mean they couldn't under the right circumstance, but most of the circuits inventions are taking place in semiconductor companies, one. Two, most technology is so complex now it takes a team of people to make it happen. You, to put an idea together, whereas in the early days, I'm thinking of a terminology, I'll use the work the 11Benski-Fetch 11--and I know you've never of that. When I was back in RCA, a very bright guy who came to RCA from MIT where he was working on Whirlwind, came up with an idea of drawing information from a drum in clumps of data and transferring it to a core memory where it was operated on the core memory, and then putting the results back on the drum again. He got a patent on that. We called it the Benski-Fetch. It was named after Lowell Benski. Nowadays that's old hat. You know what I mean? But yet in the 1950s that was an invention because it was the first time done. I have some patents on library systems for storage retrieval based on looking up a reference and then using that reference to point to another reference and getting that, as a library system for searching for data on tape, with all the front and the back ends of tape all identified on a drum. So I can know which tape to go to . Now that technology is//, nobody needs it any more. Yet it could be identified with a person. Or, while I was working on a sales recorder, when we were storing information on a drum, we wanted to be able to find the . data and yet we

with a person. Or, while I was working on a sales recorder, when we were storing information on a drum, we wanted to be able to find the . data and yet we were looking up some prices. A guy by the name of Phillipi Tonkel, a guy from Brazil, came up with a hashing scheme which everybody uses in the industry now. And we got a patent on it way back then. And it's a scheme of taking data that has an identifying number, and operating on that number and developing an algorithm which randomizes that number in such a way that you can distribute it in various channels, and you can search the channels by taking the unknown number, randomizing it, having a resultant number point to that channel, and go find it. And that's what we used on the sales recorder, and yet hashing is a common technology now. But it was a marvelous invention and you could point to that guy who did it. Now maybe somebody else did it in other companies, but we didn't know it. There's a lot of small invention like that. Circuits inventions, flip-flop inventions ideas. This fellow Chuck Profster came up with a novel way of designing a ,two-two flip-flop that he could get isolated output from. And he did it by' putting a resistor in the cathode of the tube and that change of voltage across the resistor was the output signal. And yet he made the circuits stable enough so it functioned. And that became a patent. So there's a lot of early st.uff that was done that you could name people for. And in the early days of the computer industry, whenever, when transistors started coming in, everybody that could be applied to it was translating tube surfaces and transistors and writing patents on them. But that was RCA. RCA was very patent-conscious .

F: So maybe patents aren't the way to document product development.

S: Well, patents still are, because there are some really great things happening that people get patents on. But also, I'm sure the guy who invented the CD deserves a patent. And yet, way back then, we worked on thermoplastic recording at RCA. In the early '50s we were working on a . scheme where we coated a disk with a thermoplastic material and the disk (no, I'm sorry, it was the first tape, magnetic tape) and the tape passed into a vacuum chamber through an isolator that squeezed down on the tape, and the thermoplastic was written on by an electron beam which warped the thermoplastic and made it take a shape. And then as it came out, a light was shined on it and you could then, based on the reflection, detect whether it was a 1 or a o. So we made a thermoplastic board and we tried to apply it two ways: one, for computer storage data, and the other for television. And yet the change of ... like a laser writing on a laser disk does exactly the same thing with a brand new technology. That's what I mean, re-invent, re-invent, re-invent. Yeah. I guess my enjoyment in this whole computer industry is I was always down in the front of something. It's called the "neck sticking out position."

F: You know, some people don't like that, I don't think, being in that position ...

S: I always took dumb risks.

F: Do you think they were dumb?

S: It was fun, I think that's the main thing, if you do it, you like it.

F: One other thing I wanted to ask you about is your reaction to the merger.

S: Oh. At first I was skeptical. Yeah, I just wondered how in the hell is Burroughs and Sperry going to make something go together. But, I give tremendous credit to Blumenthal. That guy is a genius. Because many of us saw synergies. I mean, you could look at a company and say, "Yeah, they got this and they got that: 1 But at his level--he's not an engineer in that sense--to be able to perceive that somehow or other ... I think it's more than perceiving, it says, when you're at that level of power, and you decide that something's going to happen, and you put enough mental force behind it, you can get it to happen. And i think that's the strength of a good leader. You may not know exactly how it's going to happen. You may see the threads of a connection, but you say I'm going to make those threads solidify. And then you say, hey, you go do it. And it's the go do it part, and the judgment factor to apply as to how much money to spend, how much not to, what to get rid of and what to keep, is the amazing thing, to me, about making the merger work. Plus trying to make it look like you really merged, not one to take over the other, so that the officers of the key people of the two companies didn't feel threatened, or particularly, Sperry didn't feel like being a threat and therefore we're on the low end of the ball.

F: Did you get the impression that he worked real hard?

S: And the fact that he changed the name to a completely different name, whether you like Unisys or not doesn't make any difference, just the fact that he changed the name, tried to give it a whole new image, is a good. piece of psychology. I'm real pleased with what's happened, because the stock's gone up, whatever we own in stock is worth more, and that's good. I'm a person who believes in taking a risk and also trying to get a reward for it. I think it's gone weU and I don't know all the officers--I've just met Mr. Kroger for the first time when I went back to Detroit. He impressed me as a pretty sharp guy, but that's all I know. I've met Mr. Blumenthal several times and he's a bright guy. When they brought Jerry Jacobson in, I thought ... he's a friend of mine. I thought he was a very bright guy and he may rub people the wrong way a lot because he's a very cynical sort of a guy, but he sure has got a good mind. So I think you have some really good minds in the company and you direct them right, and you're going to pull results in the end. I was skeptical at first. A lot of us were, I'm sure. But it's working out. I think also, another thing that impressed me was the . spirit with which data was exchanged. Teams came out here, some of our teams went back there to meet the Sperry people, they met with us, and there was a fairly open divulgence of information. That's important to keep things going on the right foot.

F: Could we talk a bit about your involvement in phase review and how it compared to what existed before?

V: O.k. Well, when I first came to work here, there was no phase review. Instead, the process of getting a program started, was called the PDA program. PDA process was the Product Development authority and the PDA really was a loosely-administered way of defining, or marketing of the product planning. First of all, PDA was started by ... by start I mean it was originated through request from marketing, or product planning, rather, to engineering, to propose to them a product around this description. So the first thing that came out of marketing was a description of what they wanted: Actually I use the word marketing loosely, I really mean what Dow CPM or Product Manager, and then called Product Planning. It existed before '73 when I joined. And the PDA process then was designed to take this request for a response and respond to it. And the PDA response required that you define what you wanted to build, estimate what it would cost in terms of development cost, define the product in response to the specification that you got from Product Planning, and indicate a competitive product cost of the unit, and then submit that. That, in turn, was reviewed by Product Manager, and it was finally signed off it o.k. by Dr. Bob Johnson and/or, in other words Corporate Engineering, as well as the group, the Engineering Vice President and the group directors. That became the authorization to spend money. O.k.? And the PDA asked for such things as schedule, cost, dates, marketing information, but in a . loose form, and had no phasing to it. It asked you to furnish a schedule. Then the schedule would be monitored ad hoc by internal local management and monitored by corporate management, by corporate engineering as part of a periodic review process which was not that highly formalized. When Blumenthal came into the company it was decided that a more formal method of defining product programs was necessary. And there was a prototype in terms of either IBM or Xerox's phase review process. And the concept behind that was that a product goes through various phases in its cycle: the concept phase, the development phase, the product engineering phase, the release to manufacturing, and finally, the release to a manufacturing and field test, and then finally, a year after the first shipment, a review process that says is this product still good? So a set of guidelines was prepared by a small team in Corporate Engineering in the Syst~ms Management portion of

Corporate Engineering. And I think that's kind of ... Lyle, I think I mentioned, was involved. Tom Carpenter, I don't think Doug Simmons was involved because he was a corporate field engineer or something like that. And they came out with an early manual on it, and it was fairly well written. And a lot of the ideas were lifted from other companies, but that's o.k., and was sent to the plants for review. And along with it came an agenda for training a training program, and since I at that time was in charge of the systems management for the engineering group here, I was one of the first ones to go in to training, along with about a half a dozen other people. And the training was designed to be a handson type training in which we took a home-created product concept and just wrote a phase review on it, as if we were really dealing with a product. . V: Now, the first product that we put into phase review process here ... this is hardware, software came a little bit later. The first hardware to be put under phase review was the 5900 and I was given the responsibility of preparing that and it was a good shakeout method because it was kicked out and then accepted after we did some modification. And the whole process of scheduling phase review and timing here came to the focus. By timing I mean, first of all, the whole concept was broadcast to the company and so ·" they had it dovetailed and fit in with the various review programs. There was also a problem of concurrency. All phase reviews had to be concurred by the various function that were affected. First of all, there was the various management functions affected: financial, for overall analysis of profitability, manufacturing for manufacturability, engineering for sound engineering, marketing--is there a marketing plan? field engineering, if there's a field plan. You know, all the elements had to concur and be a part of the review process. Then they had a lot of guys I considered hanger-ans, who sat there and felt it was their job to keep busy in Corporate and usually reject everything--on the most nit-picking thing you've ever seen. That tended to bottle up the phase review process so that it took time to clear a phase review, that is, theoretically, when you entered Phase 1, you could be in Phase 2 and if you exited, ongoing to Phase 2, to Phase 3, from Phase 3 to Phase 4. So stuff could get hung up except no plant was going to sit there and wait on the review process. So the idea then was to keep the discipline of the phase review, not stop the plant from moving forward unless there was really something wrong. // So the trick was now how to invent ways of shortcutting the review process, clearing up non-concurrences and getting people to pick on the real major things. And, as it evolved, people who nonconcurred out of the area of their expertise were not permitted to nonconcur. That is, if I'm a marketing guy and I nonconcur with a manufacturing problem, forgefit. That's not right. If you're a marketing guy you concur or nonconcur with a market-oriented problem.

F: That makes sense.

END OF SIDE TWO, TAPE 1 OF SPIELBERG INTERVIEW

Book : "Steven Spielberg - A biography - 2010, 2nd edition - by Joseph McBride"

Chapter 1, family history

[HB004M][GDrive]

ONE of the stories Fievel told was of how he learned his lessons. As a Jew growing up in Odessa, Russia, in the late nineteenth century, Fievel was prohibited from attending secondary school by the czarist government's numerus clausus (closed number), a quota system severely limiting the number of Jews allowed to receive a higher education. But he found a way around the edict. Steven remembered what Fievel told him: "They did allow Jews to listen through open windows to the classes, so he pretty much went to school-fall, winter, and spring-by sitting outside in driving snow, outside of open windows."

A version of this memory made its way into An American Tail. Separated from his family after coming to New York, Fievel Mousekewitz forlornly presses his nose against a pane of glass to watch a group of little American mice attending school. Always the outsider, even in America, the strange new land of freedom, where there were supposed to be "no cats." Though Steven Spielberg failed to acquire his grandfather's yearning for education, he too became a

storyteller, and he never forgot the image of the boy sitting outside the schoolhouse, or what it showed him about being a Jew in a hostile land.

Always convenient scapegoats during economic and political upheavals in a land of deep-seated anti-Semitism, Russian Jews in the late 1800s were subjected to increasingly frequent and brutal pogroms (the Russian word for "devastation")- In his childhood, Steven listened with fascination to his grandparents' tales of pogroms. The social and economic liberties of Russian Jews were restricted further by laws compelling them to live only in shtetlach and barring them from most occupations except for certain forms of trade. Nearly 2 million Jews fled Russia and Eastern Europe for the United States between 1881 and 1914, "a migration comparable in modern Jewish history only to the flight from the Spanish Inquisition," Irving Howe wrote in World of Our Fathers. America was seen "not merely as a land of milk and honey," observed novelist Abraham Cahan, "but also, perhaps chiefly, as one of mystery, of fantastic experiences, or marvelous transformations."

Steven Spielberg's ancestors were part of that vast migration, settling in the hospitable midwestern city of Cincinnati, which, in the words of historian Jonathan D. Sarna, was then "the oldest and most cultured Jewish community west of the Alleghenies." Some of his relatives remained in Russia for generations to come, and some eventually went to Israel, but many of those who did not emigrate were murdered along with the rest of their communities in the Nazi Holocaust. His father estimates they lost sixteen to twenty relatives in the Holocaust, in both Ukraine and Poland.

The original roots of the Spielberg family, Arnold Spielberg says, may have been in Austria-Hungary, where some of his ancestors, before emigrating to Russia, may have lived in an area controlled by the Duke of Spielberg. The Spielberg family name, which is German-Austrian, means "play mountain." Spiel connotes either recreation or a stage play (cf. the English word "spiel," meaning a recitation), and berg means mountain or hill. It is a fittingly theatrical name for a playful adult who works in show business and ever since his childhood has loved to build and film miniature mountains. A "play mountain" appears as a central plot device in Close Encounters of the Third Kind: Richard Dreyfuss obsessively constructs in his living room the image of the Wyoming mountain where, in the film's magical finale, the alien mother ship makes its landing. **A film production company Arnold and Steven Spielberg formed early on, when Steven was a college student in Long Beach, California, was called Playmount Productions.**

Steven's grandfather Shmuel Spielberg, who in America would change his name to Samuel, was born in 1873 in Kamenets- Podolsk, Russia. Once ruled by Lithuanian-Polish nobles and known in Polish as Kamieniec Podolski, it is now part of the independent state of Ukraine. In 1897, a few years before Shmuel's departure for America, Kamenets had a population of about forty thousand, including about sixteen thousand Jews.

Most of the Jews spoke Yiddish as their principal or only language, and they lived as all Russian Jews did, in a tightly knit, insular community whose religious and cultural tradition brought comfort and mutual support in the midst of hostility. Although anti-Semitism permeated many of the city's institutions during the reigns of Czars Alexander III and Nicholas II, the memorial book of Jewish life in Kamenets reports, "In general, relations between Jews and non-Jews in town were correct." Even during the Ukrainian pogroms of 1881 and the widespread pogroms of 1905, there were no massacres in Kamenets, although there was some vandalism of Jewish properly.

Steven's grandfather Shmuel was the second son of a farmer, rancher, and huntsman named Meyer Spielberg and his wife, Bertha (Bessie) Sandleman, who also had three younger daughters. When Shmuel was about five years old, both his parents died in an epidemic, and he was raised by his brother, Avrom (Arnold Spielberg was given the Hebrew name Avrom in his honor). Shmuel worked on his brother's ranch as a cowboy, rounding up cattle and horses. Jews were conscripted into the czarist army for a six-year period, and Shmuel found his way into the army band, playing the baritone, a brass wind instrument. "By staying in the band," his son Arnold relates, "he managed to keep from getting killed or shot. And then he became a cattle buyer for the Russian army. He used to go up to Siberia and buy cattle, and he dealt with Manchuria. When the Russo-Japanese war started [in 1904], he just said, 'I will not get back into the army again.' He escaped to America in 1906, and then he brought my mother in 1908 [the year they married]."

Samuel (Shmuel) Spielberg's wife, Rebecca Chechik, "Grandma Becky" to Steven's generation, was the daughter of Nachman (Nathan) Morduhov Chechik and Reitzl (Rachel) Nigonova Hendler, who had eight other children. The Chechik family name, which is also spelled Tsetsik and means "linnet" in Russian, later was Americanized to Chase.

The Chechiks had a brewery in Sudilkov, a shtetl that no longer exists. Sudilkov was in the Kamenets area, near the larger town of Shepetovka, where some other family members lived. Arnold Spielberg relates that his grandfather Nachman Chechik "prayed and studied the Torah. His wife ran the brewery business. She was a shrewd woman. She and the children ran the business. My uncle Herschel, the oldest son, was the brewmaster. In those days, the old Jewish men, if they could get out of business and study the Torah, that's what they did." The brewery trade was forbidden to Jews by the Russian government in 1897, and some of Rebecca Chechik's siblings eventually emigrated to China. They lived in the Manchurian city of Harbin and then in Shanghai's British enclave, the setting for the opening scenes of Steven Spielberg's World War II film Empire of the Sun.

Samuel Spielberg, Arnold's father, worked for a few years as a grocer and a peddler in Cincinnati before he found a steady but modest living as a jobber, operating a store on West Third Street. "He'd go down to the small stores in Indiana, Kentucky, and Ohio," Arnold explains. "He'd buy up their merchandise that they had not been able to sell. He'd buy what they called job lots, or incomplete lots. He'd bring them to his store and he'd sell them to other merchants, or to retail; he had some retail trade. And, of course, in the wholesale trade he sold to even smaller stores."*

Arnold's mother, Rebecca, was "a very enterprising woman. She took care of the kids and ran the house. She was interested in politics-we were Democrats from way back-and she'd read a lot, go to plays, go to concerts. She'd join all the Jewish organizations." Mildred (Millie) Friedman Tieger, a longtime friend of Steven's mother, remembers Rebecca as "a strong, powerful woman, very smart, and more domineering" than her husband.

In addition to their son Arnold Meyer Spielberg, who was born on February 6, 1917, Rebecca and Sam had a younger son, Irvin (called Buddy or Bud), who became an aeronautical engineer and worked on NASA's space program, and a daughter, Natalie, who married Jacob (Jack) Guttman and with him ran a family business that manufactures cake decorations (Natalie died in 1992).

STEVEN'S mother's side of the family, the Posners, originated in Poland. "Posner" means "a person from Poznan," the name of a city and province in western Poland (also spelled Posnan or Poseft). Poznan was taken over by Prussia in the late eighteenth century, and as the late Dr.Jacob Rader Marcus, dean of American Jewish historiography, noted in a 1994 interview, "Germans despised Posners. If a German says, 'He's a Posner,' it means he's held in contempt." But the Posner ancestors of Steven Spielberg had a more worldly background in Russia than the Spielbergs, for the Posners' cosmopolitan hometown of Odessa, a bustling port on the Black Sea, was known as "The Paris of Russia."

In the end, however, Jews were scarcely more welcome in Odessa than they were anywhere else in Russia. Odessa was the site of regular anti-Jewish riots, and an unusually severe pogrom occurred there in 1905, the year of the attempted revolution and the mutiny by sailors on the battleship Potemkin (later the subject of Sergei Eisenstein's silent film classic Potemkin, which includes the famous Odessa Steps sequence). When Odessa's Jews celebrated the czar's promise of reforms, four hundred Jews were killed in retaliation during four days of mayhem. Such attacks-which also occurred in several other parts of

Russia during 1905-were provoked by the authorities and executed by local ruffians with the help of policemen and Cossacks.

That year of turmoil was the year Philip Posner, born in Odessa in 1884, came to Cincinnati to make a new life for himself and his family, one he hoped would be safer from persecution and tyranny. He would remain devoutly Orthodox, resisting the modernizing influences of the Haskalah, the Jewish Enlightenment movement that flourished in Odessa, and the Reform movement in America. But Odessa's cultural ferment would leave an imprint on his consciousness, despite the deficiencies of his formal education. An artist manque, Philip Posner would pass along his artistic inclinations to his daughter and his famous grandson.

* Steven Allan Spielberg's Hebrew name, Shmuel, is a tribute to his grandfather, who died before he was born. Asked why Steven was not given the first name of Samuel, Arnold says, "We gave him an Anglicized 'Steven.' We just artificially made it that. Leah and I wanted to give him a non-Biblical name. 'Allan' came from the Hebrew Aharon. And we just liked the name Allan, out of nowhere."

Philip's parents, Simon Posner (son of Ezekiel Posner and Anna Fildman) and Miriam (Mary) Rasinsky (daughter of Benjamin Rasinsky), emigrated soon after him to Cincinnati, where Simon Posner, like Samuel Spielberg, became a jobber. The oldest of six children, Philip followed the same profession, selling schmatte (clothing) and other merchandise to support his wife, the former Jennie Fridman, and their two children, Leah and Bernard (Bernie). ***["Leah Posner" and "Bernard Posner"]***

Philip Posner was "a very emotional man," his son-in-law Arnold Spielberg recalls. "A religious, very observant man. He used to go to the synagogue in the morning, in the evening, any time. He was at one time quite well-to-do, and then the Depression took him under, along with many other people."

One time, Leah recalled, her family did not have enough to eat for several days until her father made ten dollars buying and selling old jewelry. He used the money to take them on a holiday. "We were poor, but there was no depression in our house."

Philip worked mostly out of his home, and Steven loved to play in his grandfather's attic, which was crowded with his merchandise-shoes and socks and shoelaces, belt buckles and tie clips. Norman Cummins, a fellow Jewish merchant who ran a discount clothing store, would buy Philip's discontinued stock "as a mitzvah-a blessing," Cummins's wife, Edith, remembered. "Mr. Posner was a little, slight, sweet sort of man. He had a very nice, pleasant little house. I would go there with my husband, and I'd talk to Steven. He was a real skinny tyke, very lively. Who knew he was going to be this big man? He'd sit there and eat a cookie and dip it in a glass of milk. When he had finished his glass of milk, his grandmother would strain the cookie out of the milk and put the milk back. I was very impressed by that. I don't know if it was poverty or just frugality."

Like the violin-playing Papa Mousekewitz in An American Tail, Steven's Grandpa Fievel poured his heart not into his business but into his music, playing the guitar and dancing ballet. Leah, who inherited her father's love for music, felt his creativity was sidetracked by his struggle to make a living. Fievel's brother Boris was the first known relative of Steven Spielberg to enter show business. He was a Shakespearean actor in the thriving Yiddish theater of the period; Leah remembers Boris declaiming Hamlet's "To be or not to be" soliloquy in their living room, in Yiddish. Boris was also a vaudevillian, singing and dancing with a straw hat and a cane, and he later became a lion tamer in the circus. (In Spielberg's 1995 animated film Balto, set in Alaska during the 1920s, there is a Russian Jewish refugee goose named Uncle Boris.)

Leah's mother, Jennie, born in 1882, was a native Cincinnatian. She was the second oldest of ten children born to Russian emigres Louis Fridman, who had come to the United States by way of London in 1870, and Sarah Leah Nathan. Louis Fridman's father, a cigarmaker named Israel Fridman, was born in Poland in 1830-the earliest date of birth that can be traced for any of Steven's ancestors-and died of emphysema in Cincinnati in 1883Louis practiced his father's profession for a while, but he also worked as a horse cart driver and a traveling salesman.

Steven's Grandma Jennie was a lively, hardworking, and self-reliant "American lady," as family friend Millie Tieger described her. "Both of [Steven's] grandmas were more assertive than the grandpas." Immigrant men often found that to be the case, for their traditionally dominant role in the old country tended to wither away in the face of the harsh economic realities and more liberal mores they encountered in America.

Before her marriage to Philip Posner in 1915, Jennie briefly ran a millinery shop with her sister Bertha. Jennie also majored in English at the University of Cincinnati, and Arnold Spielberg remembers her as "a very bright woman and a cultured, gentle woman." She called everyone she liked "Dolly," including her daughter Leah, who was born on January 12, 1920, and inherited her effervescent, outspoken personality from her mother.

Jennie "was never too domestic," Leah admiringly recalled. Jennie worked as a milliner and clerk for a while after her marriage. Later she taught English in her home to German Jewish immigrants, many of whom were refugees from Nazism and had their tuition paid by local Jewish charities to help them acclimate to life in America and to prepare for citizenship applications. And yet the husband of this thoroughly modern American lady never lost his old-world ways.

Fievel Posner had a long white beard and wore the traditional Orthodox garb of black coat and hat. While growing up, Steven became so embarrassed by his grandfather's appearance and frequent davening (praying) that he tried to keep his gentile friends away from the house when Grandpa Fievel came to visit. One day when Steven was eight years old and living in Haddon Township, New Jersey, he was playing football with some friends in the street, "and suddenly my grandfather, with the yarmulke, comes out of our house, two houses down, and yells: 'Shmuel! Shmuel!' [Steven's Hebrew name]. I'm not answering him. I'm pretending I don't know him. I'm denying that name. My friend is saying, 'He's looking your way. Does he mean you?' They point at me, and I'm saying 'No, it's not me,' and I'm denying the existence of my own grandfather."

I F not quite the "paradise for the Hebrews" extolled by a nineteenthcentury Ohio historian, what the Spielbergs and Posners found in the Queen City of the West was a stolid, largely German-American burg where Jews and gentiles lived in relative harmony and prosperity.

Arnold Spielberg had only "a little" trouble with anti-Semitism when he was growing up, such as an incident when a man wearing a Ku Klux Klan insignia on his belt called him a "Jewboy." "But my street was the best street in the world," he nostalgically recalls. "During the wintertime, the city would block it off and we had sled riding. The street went right down into a park. We had a ballfield there. We had a woods to go play in. It was a wonderful place for a kid to grow up. You couldn't have asked for a better place."

Even though its Jewish population has always been modest compared to those of cities on the East Coast-Jews made up only about 5 percent, or 22,000, of Cincinnati's 475,000 citizens when Steven Spielberg was bornCincinnati was long regarded as "a Jewish version of the American dream," Jonathan D. Sarna wrote in his and Nancy H. Klein's 1989 history, The Jews of Cincinnati.

The roots of the city's Jewish community date back as early as 1814. As the birthplace of the Reform movement, founded in the mid-nineteenth century by Rabbi Isaac Mayer Wise to liberalize and Americanize traditional Judaism, Cincinnati is home to such renowned Reform institutions as Hebrew Union College, The American Israelite newspaper, and the American Jewish Archives. Spielberg's birthplace, the nonsectarian Jewish Hospital in Avondale, is the

oldest Jewish hospital in the United States. Partly because of its strong German influence, Cincinnati has never been immune to antiSemitism, and Sarna concludes that "in many ways, the Jewish vision of Cincinnati was simply too good to be true." But Jews arrived early enough in Cincinnati to have won the status of pioneers, and they have long been seen as an integral part of the city's social, political, and cultural establishment, even if they were not always as readily accepted in all parts of the business community.

Among the many hurdles Russian Jews, such as Spielberg's grandparents, faced when they began pouring into America in the late nineteenth century was the hostility of many German Jews who had preceded them. German Jews who had settled in America viewed themselves as far more educated, more solvent, and more cultured than the hordes of newcomers seeking their help and kinship. For much of Spielberg's grandparents' and parents' lives in Cincinnati, their German Jewish neighbors "held Eastern Europeans in utter contempt," Jacob Marcus said. "The German Jews were predominant socially, culturally, and financially, but for every German Jew there were at least five or six Eastern Europeans, which included Russians, Poles, Rumanians, and Eastern Hungarians. It was only around the 1930s or the 1940s that a few individuals of Germanic origin began to marry into the families of Eastern Europeans." In housing, too, the German Jews were "always a street ahead [of the Eastern Europeans] and ne'er the twain shall meet," he observed. "The lines were drawn very sharply until about 1950."

With the coming of the automobile around the turn of the century, Cincinnati, like the mid western city of The Magnificent Ambersons, found itself "heaving up in the middle incredibly." And as Cincinnati heaved and spread by annexing the outlying suburbs of the horse-and-buggy days, the old inner city was left a slum, occupied by Negroes and the poorest whites. Avondale, the genteel suburb of first remove for Jews leaving the West End, by the 1920s became the city's largely Jewish enclave. It was there Spielberg's grandparents and parents lived, where Steven was born and where he spent his first two and a half years.*

The more fashionable streets north of Rockdale Avenue in Avondale initially were the domain of German Jews. As the WP A's guide to the city put it, "The Orthodox Jews infiltrated the southern part of the suburb and gradually moved north, establishing a lively shopping district along Reading Road near Rockdale Avenue." Beginning less than a block from Arnold and Leah Spielberg's apartment at 817 Lexington Avenue, across the street from the Conservative Adath Israel synagogue on Reading Road, that district included the neighborhood movie house, the Forest Theatre. When Arnold was a boy, "Every Saturday we used to get a nickel and go to the Forest Theatre. I used to like to watch most adventure movies, all the Douglas Fairbanks movies, all the serials."

South Avondale was a haimish-warm and unpretentious-Jewish neighborhood of extended families and landsleit-people from the old country- who all pulled together to survive. Although his grandfather Samuel Spielberg died a year before he was born, Steven grew up with an advantage few of today's children share, that of having three grandparents living in the same neighborhood.

Leah's parents, Philip and Jennie Posner, had rented a white frame house at 819 Glenwood Avenue since 1939, the fifth home they had lived in since their marriage. Arnold Spielberg remembers it as "a very nice home. When I was going to school at the University of Cincinnati, they lived just one block over. Leah would go over to their house, I'd come back after school, and we'd sit down and have a Sabbath lunch. Then we'd pray after lunch and sing songs. I learned all their songs."

Sam and Rebecca Spielberg had lived in ten homes before the family settled in 1935 into half of a red-brick duplex they rented at 3560 Van Antwerp Place. "Our street was ninety-five percent Jewish," Arnold recalls. "And all of them were successful people, doctors, dentists, or lawyers. It was very education-oriented. My brother and I were the only engineers that came out of that street. We used to brag to each other as to how religious the families were. My friends were almost all Orthodox. We were one of the few Conservative families on the street." After Sam's death, Rebecca continued to live there, supported by her children. Although Sam's grandson would amass a fortune estimated by Forbes magazine in 1996 at $1 billion, Sam's estate amounted to only $1,728.57, of which Rebecca received $1,182.15 after the costs of his final illness, burial, and probate.

* Spielberg announced in 1989 that he planned to make a movie dealing with his childhood years in Cincinnati, from a script by his sister Anne, /1// Be Home. The movie would have to be shot on location, he said, because "there's nothing in LA. that looks like Cincinnati-nothing."

By the time of Steven's birth, many of Avondale's old homes had been cut into duplexes or subdivided into three or four apartments, with the former maid's quarters on the top floor often serving as the tiny apartment of an elderly or unmarried family member. **After Arnold's discharge from the U.S. Army Air Forces in September 1945, he and Leah rented their modest firstfloor apartment on Lexington Avenue from Mrs. Bella Pritz, who lived upstairs with her daughter (the apartment occupied by the Spielbergs was one of two on the first floor).** Though Avondale was already being vacated by German Jews, who kept moving northward into fresher and more rustic suburban acreage, it still was only "lower middle-class at worst" in those years, historian Jacob Marcus recalled. With housing growing scarcer as veterans began coming back from the war, the newlywed Spielbergs were lucky to find a decent apartment.

"It was a lovely neighborhood," recalls their neighbor Peggie Hibbert Singerman. The houses had "big backyards, huge porches on the front, swings. They were elegant houses, with wonderful woodwork in some of them." Many of those beautiful old homes remain well preserved today, long after the white flight of the 1950s that saw the Jewish population abandon Avondale to blacks climbing the economic ladder behind them. The house where Steven lived as a young child is still standing; it is a rental property owned by the Southern Baptist church, which in 1967 bought the Adath Israel building across the street, now a national historic landmark.

IN their growing restlessness with the comfortable but limiting environment of Cincinnati's Jewish enclave, Arnold and Leah Spielberg were typical of many second-generation American Jews whose postwar ambitions for themselves and their children would lead them to turn their backs on their aging hometowns and depart for the brave new world of suburbia.

Arnold Spielberg, his sister Natalie Guttman recalled, "was always a questioning, exploring, and highly intelligent youngster whose quest for learning was and has never really been quenched." But when Arnold was attending Avondale Grade School, he was regarded as "a nerd," according to a schoolmate, Dr. Bernard Goldman. "He didn't fit into the group. Other kids played ball, but he never seemed to join in that. He wasn't a spectator. He probably had his own interests."

From early boyhood, Arnold's primary interests were scientific: "The earliest influence was the son of the man who lived upstairs [in my building]. His son used to tinker around with radios. I was a little kid then, about six or seven years old, and I used to go down to the basement, watching him build stuff. Then another guy moved into the house next door-he was a radio repairman, and he gave me parts. And I was going to Avondale School one day-I'll never forget this-I was walking up the street on Windham Avenue, and I looked in the wastebasket. There was a bunch of radio stuff. I picked up that radio stuff, ran home, and opened the door-'Mom, don't throw this out!' I went to school, barely made it to class, came home-it was a crystal set that somebody had tried to fix. I just put the wires to the nearest connection and I got it to work. This was in 1927 or '28; I was ten years old at that time.

"I'll never forget putting the earphones on my uncle's ears when he came over from Manchuria to America. It was the first time he ever heard a radio. The family thought I was nuts, you know, a 'crazy-head scientist.' I was always into magnetics and electrical stuff. Making magnets, burning up batteries, making shocking machines out of batteries from the old battery radio sets. I used to go around to people's houses and say, 'Have you got any used-up batteries?' They'd give 'em to me, I'd get some power out of 'em, connect 'em all in series, make sparks. Typical kid stuff."

Arnie and his brother Buddy, who was only a year younger, shared the same hobby. "They were into electrocuting rats in the attic," their nephew, Samuel Guttman, relates. "Arnold was a ham operator [from the age of fifteen], and somehow he had an antenna system that ruined the radio reception in the neighborhood. The two terrorized the neighborhood. My mother once got so crazy she threw a punch at 'em through a glass door." Arnold "was remarkably intelligent in school, and he would fool around at home- he did all kinds of smart scientific things," recalls family friend Millie Tieger. "He built a television set in the 1930s, before anybody else did, before anybody knew what a television was. Everybody said, 'Arnold, what are you doing?"'

Some of Arnold's visionary qualities can be attributed to his avid interest in reading science fiction, a habit he later passed on to his son. "I've been reading science fiction since I was seven years old, all the way back to the earliest Amazing Stories," Arnold says. "Amazing, Astounding, Analog-I still subscribe. I still read 'em. My kids used to complain, 'Dad's in the bathroom with a science-fiction magazine. We can't get in."'

Sam and Becky Spielberg, who spoke mostly Russian around the house, were struggling to make ends meet during the Depression, and they could not afford to send Arnold and Buddy to college. **After his graduation in 1934 from Hughes High School, Arnold barely missed out on a college scholarship and had to take a job far beneath his potential, working as a clerk in a chain of small-town department stores across the river in Kentucky, run by his mother's relatives, the Lerman brothers.**

Before becoming a store manager for the Lermans, Arnold worked as an assistant manager in Cynthiana, Kentucky, for his older cousin Max Chase, a nephew of Rebecca Spielberg. Starting the process that eventually would make Arnold's son Steven into a filmmaker, Max gave Arnold his first movie camera during the early 1930s. "I started taking home movies when I lived in Kentucky," Arnold recalls. "My cousin bought one of the earliest 8mm movie cameras. He didn't know how to use it, so he said, 'Here, you use it.' I was about seventeen years old when I started doing that. I used to take a lot of junk movies, you know what I mean? Family and stuff like that. But no class. Just pictures."*

Arnold continued to work for the Lermans until the coming of World War II. **He enlisted in the U.S. Army Signal Corps in January 1942, but was soon transferred into the Army Air Forces. After serving as an airplane-parts shipping clerk in Karachi, Pakistan, he parlayed his ham-radio experience into a post as a radio operator. Stationed first in Karachi and then outside Calcutta, in the China-Burma-India theater of operations, he was part of a B- 25 bomber squadron that destroyed Japanese railroad lines, shipping, and communications in Burma, earning them the nickname of "The Burma Bridge Busters." Arnold recalls that although he "flew a couple of missions," he spent most of the war running the squadron's communications room: "At first I signed on to be a radio gunner, but they said, 'No, if you know how to fix radios, you're better off on the ground.' They wouldn't let me fly anymore." He was rotated back to the United States in December 1944, serving out the rest of the war at Wright Field in Dayton, Ohio.**

The country's shared sacrifices and its victory over fascism, coupled with the eventual discovery of the full dimensions of the Holocaust, contributed to the postwar advancement of social acceptance and economic opportunities for American Jews. The Cold War climate of fierce American competitiveness with the Soviet Union also helped open doors in higher education, science, and business during the postwar years, while helping make Christians somewhat more tolerant in their social interactions with Jews, or at least less overt about their anti-Semitism.

The most immediate and far-reaching benefit of wartime service for Arnold Spielberg was the GI Bill of Rights, which finally enabled him, like 2.2 million other American veterans, to attend college. The GI Bill gave veterans what one of them called "a ticket of admission to a better life."

It was that for Arnold Spielberg, making it possible for the former department store manager to earn a degree in electronic engineering from the University of Cincinnati in June 1949 and launching him on what would turn out to be a highly successful career in computer engineering. Arnold remembers that just before his father died, he was "so proud" to see his son enter college.

• Arnold is still shooting home movies today, mostly of his travels, using a Sony High-8 video camera and a professional-quality Avid editing system his son gave him. In his current occupation as an electronics industry consultant, Arnold also has been making industrial.films: "Ever since I retired, they say to me, 'With the name Spielberg, you've got to be able to make movies.' So they got me making movies."

"Arnold blossomed in an academic setting," family friend Millie Tieger observed. "Arnold was such a turn-around person. He married Leah and she encouraged him to go to college. She pushed him. She was already a graduate of the University of Cincinnati; she was a smart girl, talented, very outgoing. I think she wanted Arnold also to have a good education. He turned out to be a brain, absolutely brilliant, a pioneer in computers. When Arnold was working in New Jersey, doing early computer research, he used to come to Cincinnati, and he would sit down at our kitchen table and calculate numbers to the thirteenth power. I had no idea what he was talking about. I would say, 'Shut up, Arnold."'

WHEN Steven Spielberg's mother attended walnut Hills High School, the college preparatory school for Cincinnati public school students, she was "kinda mousy. So was I," recalls fellow student Edith Cummins. "We weren't the prom queen types. She was very plain." "I was different-looking," Leah told Fred A. Bernstein, author of The Jewish Mothers' Hall of Fame. "But I never wanted to change. If I had had a tiny pug nose, maybe I wouldn't have had to develop a personality. But instead, I learned to play piano. I was somebody. I loved my life, and I believed in me."

"She was so different from the Spielbergs," notes Millie Tieger. "She had a sparkle. They were all bigger, dark, and here is this under-five-foot young lady, blond, her eyes flash, she talks like this [moves her head and eyes rapidly as she talks]. Arnold was super-smart and accomplished, but I think Leah had a more all-encompassing 'people' personality. She's a very insightful creature."

Leah started dating Arnold Spielberg in 1939- Arnold attended high school with Leah's brother, Bernie. "We all played tennis together," Arnold's sister Natalie recounted. "Leah was going with somebody else at the time, but when she broke up with her boyfriend I introduced her to Arnold because I thought that would be a good match."

During the early 1940s, Leah pursued her musical ambitions as a student at the renowned Cincinnati Conservatory of Music, affiliated with the University of Cincinnati. She planned a career as a concert pianist and did some public performing, much to the pride and delight of her family. Leah was "a very talented concert pianist," Arnold says. "She contributed a lot of artistic talent to Steven."

Leah, a home economics major in college, was graduated and took a job as a social worker for the Travelers Aid Society at the city's Union Terminal. She married Arnold in South Avondale's Adath Israel synagogue on February 25, 1945, while he was still in active service at Wright Field. Joining him in Dayton, Leah worked for the local social services department. After his discharge later that year and their return to Cincinnati, Leah helped administer

Bayern, Leah worked for the local social welfare department. After his discharge later that year and their return to Cincinnati, Leah helped administer electrocardiograms for a few months at the Jewish Hospital, but quit that job shortly before Steven was born at the same hospital. With her own artistic career sidetracked by the demands of raising a family, she passed on her artistic ambitions to her son, but never stopped playing the . piano.

"The first piece of furniture we got when we were married was a piano," Arnold says. "We borrowed a bed, and we bought a Baldwin spinet." Arnold, who took piano lessons as a boy, was always an avid music listener. "We had a big collection of classical records," he recalls. "We had classical music playing in the house all the time, way back, early on." While pregnant with Steven, Leah spent much of her time playing classical pieces on her piano, and when he was an infant in diapers, he would sit on her lap on the piano bench, listening and learning to tap out the music. Sometimes Arnold also got into the act: "I knew enough to know the notes, so when she'd play, I'd turn the pages."

Sometimes the music would affect Steven in unexpected ways. "Steven always had a highly developed imagination," said Leah. "He was afraid of everything. When he was little he would insist that I lift the top of the [piano] so he could see the strings while I played. Then he would fall on the floor, screaming in fear." But Millie Tieger, who remembers watching him as a small child sitting at the piano with his mother, suggests that the early influence of Leah's music is "the key to the understanding" of his creative development: "What went into Steve when he heard his mother play music so beautifully?"

Like fellow wunderkind director Orson Welles, whose father was an inventor and whose mother was a concert pianist, Spielberg acquired his dazzling blend of artistic talents from a synthesis of his parents' disparate abilities. He once said he is the product of "genetic overload." His father describes Steven's personality as "a lucky piece of synergy," explaining that Steven's mother is "a very musically creative person, she's a good dancer. And she's a zany type. I'm a little more grounded. But I also like creative things. I was a great storyteller. I love science fiction."

Arnold's pioneering creativity within his own field of computers has brought him several patents. When Steven was an infant, his father would put him to sleep by the imaginative means of using an oscilloscope to reflect wavy lines on the wall. Though Steven showed no interest in following his father into engineering, he picked up his interest in filmmaking from his father. Steven's fascination with all kinds of cutting-edge technology and his mastery of the tools of filmmaking have been evident from the earliest days of his professional career.

The influence of music is also strongly evident in Spielberg's career. He played the clarinet (though not very well) in his grade school and high school bands, and sat in as first clarinet for composer John Williams in the beach scene of Jaws. He still noodles on the instrument for pleasure and relaxation. He has been a passionate collector of movie scores since childhood, and has said, "If I weren't a filmmaker I'd probably be in music. I'd play piano or I'd compose. I'd probably be a starving composer somewhere in Hollywood right now, hopefully not starving, but I probably would not have been successful."

In the view of Williams, who has written the scores for most of Spielberg's films, he is being overly modest about his musical sense: "Steven could have been a composer himself. He has that rhythmic sense in his whole being, and I think that is one of the great things about his directing-this rhythmic, kinetic sense he has."

Through his parents, Spielberg inherited his love of music from Grandpa Shmuel, who performed in the Russian army band, and from Grandpa Fievel, the Russian immigrant Jew who was not allowed to go to school but used his music to proclaim "How wondrous are Thy works."

Perhaps the most joyous scene in all of Spielberg's movies is the ending of Close Encounters of the Third Kind, in which the scientists finally devise a way of communicating with the alien mother ship by using their computers to play synthesized music together. The musical interchange between the humans and their extraterrestrial visitors starts as a few tentative notes and quickly becomes a rapturous duet of spiritual celebration.

"When I saw Close Encounters," Millie Tieger recalls, "I thought, There's Leah with the music and Arnold with computers. That's Steve, the little boy. Steve wrote a movie about Mommy and Daddy."

Sept. 8, 1996 - NYTimes - "Bernard Posner, 80, Advocate For Those With Disabilities"

Source - [HN01H0][GDrive]

By Robert Mcg. Thomas Jr.

Bernard Posner, a Government bureaucrat who was so moved by the plight of disabled veterans that he put his very able body on the line as a leading champion of the rights of all Americans with disabilities, died on Wednesday at nursing home in Rockville, Md. He was 80 and had been executive director of the President's Committee for the Employment of the Handicapped.

His family said the cause of death was a stroke.

A native of Cincinnati who majored in English at the University of Cincinnati, Mr. Posner later studied under the G.I. bill to receive a master's degree in communications from American University.

He came through his Army service in World War II unscathed and with no special interest in the problems faced by the disabled. But when **a chance encounter with friend led to a position in the Veterans Administration's press office after the war,** Mr. Posner unwittingly took what would become more than a job.

Working with disabled veterans to create national campaigns to promote their employment had such a transforming effect on his outlook that he was soon a man with a mission.

Recognizing that millions of civilians with physical or mental handicaps faced the same problems as disabled veterans, he started working as an unpaid part-time volunteer for the Presidential committee on the handicapped that had been established by Harry S. Truman.

Mr. Posner joined the committee full time in 1960, initially as a special assistant to the chairman, Harold Russell, later as assistant director, and as executive director from 1975 until his retirement in 1986.

It was a reflection of his zeal and his devotion to the cause of the disabled that during his years as assistant director, Mr. Posner went somewhat beyond the official scope of his job and actually posed as a mentally retarded worker to gain insights into how the retarded are treated by bosses, co-workers and the public.

After brief stints working in a Washington laundry, picking onions in Arizona and washing dishes at a Los Angeles restaurant (all with the secret complicity of the business owners) Posner wrote articles about his experiences and used them in arguing for more enlightened treatment for the mentally deficient.

Mr. Posner, whose efforts were widely recognized by advocates for the disabled, helped lay the groundwork for the Rehabilitation Act of 1973, which required Government contractors to provide accommodations for handicapped workers.

Even before the passage of the landmark Americans With Disabilities Act, which extended the provisions of the 1973 law to an estimated 43 million handicapped Americans in 1990, Mr. Posner had been instrumental in getting millions of dollars' worth of elevators and other special provisions for the handicapped in the construction of the Washington Metro.

After he retired in 1986, Mr. Posner continued his work as a volunteer with the National Organization on Disability. In 1990, when President George Bush signed the Americans With Disabilities Act, the man who had taken a Government job and discovered a national mission was at the White House ceremony.

Mr. Posner, who lived in Silver Spring, Md., is survived by his wife, Bess; a son, Paul of Burke Va., and a granddaughter.

Mr. Bernard Posner, son of Mr. and Mrs. Philip Posner, 819 Glenwood Avenue, has been appointed director of radio and television activities for the Veterans Administration in Washington, D.C.

A graduate of the University of Cincinnati College of Liberal Arts in 1938, Mr. Posner served as editor of the Schenley Distillers house organ at the outbreak of World War II.

After serving at various Army stations in the United States, he was discharged as a captain in January 1946. Since that time he has been associated with the information service of the Veterans Administration in Washington. He is married and has one son.

As director of radio and TV activities for the VA, Mr. Posner has charge of a weekly recorded program that is broadcast over 2500 stations, television spot announcements, full-length features and other programs.

THE ENQUIRER, CINCINNATI, THURSDAY, MAY 29, 1941 17

ENGINEER AWARD GIVEN

To Irvin Spielberg, Member Of 1941 Class At U. C.

—Pogue Studio.

IRVIN SPIELBERG.

Designated the outstanding engineering student in the University of Cincinnati graduating class, Irvin Spielberg, son of Mr. and Mrs. Samuel Spielberg, 3560 Van Antwerp Place, last night received the annual special award of the Student Tribunal of the College of Engineering and Commerce. The award, comprising two books, "Handbook of Engineering Fundamentals" and "Advanced Mathematics for Engineers," was presented at the Co-op students' annual stag dinner in the Student Union.

Spielberg, 22 years old, a graduate of Walnut Hills High School, is to receive the degree of aeronautical engineer June 6. In his five-year cooperative course at U. C. his average grade was 5.05 out of a possible 5.5, officially one of the highest averages in the college's history. He has been President of the Phi Eta Sigma chapter, Secretary of the Tau Beta Pi chapter, Vice Chairman of the American Institute of Aeronautical Sciences branch, director of music activities for the University Arts Board, a member of Omicron Delta Kappa, the campus Y. M. C. A., and various Co-op Day committees.

SOCIETY 21

Impey-Bailey

Lieut. G. Warren Bailey, of the aircraft laboratory at Wright field, and Miss Dorothy Impey, of Tulsa, Okla., were married Saturday, January 31.

Lieutenant Bailey, a native of Tulsa, was commissioned a second lieutenant at Ft. Sheridan July 31, 1941. He is a graduate of the aeronautical engineering school of the University of Cincinnati. Mrs. Bailey majored in music at Tulsa university. She is employed in the engineers' department at Wright field. They are residing on Gramont avenue.

Attendants at the wedding were Irvin Spielberg and Agnes Sutterfield. Lieutenant Bailey is the son of Mr. and Mrs. G. C. Bailey, and his wife is the daughter of Mr. and Mrs. G. D. Impey. Lieutenant Bailey has been at Wright field since August, 1941, and Mrs. Bailey came to Dayton in December, 1941.

What Journal Herald Readers Say

Worthwhile Discussion

Editor of The Journal Herald:

How many of us read the papers, hear and watch news reports on radio and TV, with that helpless feeling "What can I do about it?" In the first place, we don't know what news to believe, and then we feel, who cares what we think, anyway?

Well, this spring Daytonians are going to have a challenging opportunity to educate and air their opinions. The Chamber of Commerce, the Council on World Affairs, and the University of Dayton, are jointly sponsoring a discussion group on world politics based on books published by the American Foundation for Political Education.

The first Dayton group last fall was really an eye opener. World events are not too complicated for us ordinary citizens to think and talk about intelligently.

FOREWORD

This project was carried out by the Dynamics Branch of the Aircraft Laboratory, Directorate of Laboratories, WADC, under Research and Development Order No. 159-36T, "Investigation of Flutter Problems of All-Movable Tails". The tests were conducted in the Wright Air Development Center Five Foot Wind Tunnel during February 1953. The authors were also the project engineers.

Mr. Leon A. Tolve materially assisted the work by many helpful suggestions. Mr. Francis F. Hense constructed the flutter model.

This report reveals information relating to flutter research and has applications to military aircraft design. Since the safeguarding of this information is necessary in the interests of national security, this report has been classified "Confidential" in accordance with paragraphs 2.a and 24.a. (9) of AFR 205-1.

CONFIDENTIAL

[HG008L][GDrive]

CONFIDENTIAL

ABSTRACT

The results of subsonic wind tunnel flutter tests on a dynamic model of an unswept all-movable horizontal tail are presented. The test data show the variation of flutter speed with stabilizer rotational restraint for three positions of the rotational axis. In addition, the effect of free-play in the stabilizer actuating mechanism on the flutter speed is determined for one rotational frequency at one rotational axis position. Complete model data, including the measured zero airspeed coupled vibration frequencies and node lines, are included.

PUBLICATION REVIEW

This report has been reviewed and is approved.

INTRODUCTION

The current use of all-movable horizontal tails in place of the more conventional stabilizer-elevator combination has introduced some new flutter problems to the aircraft designer. In particular he needs to know how stiff the actuating mechanism of an all-movable tail must be in order to insure freedom from flutter, and what amount of stabilizer rotational free play can be tolerated before a normally safe configuration becomes dangerous from the flutter standpoint. In order to provide answers to questions such as these, the Aircraft Laboratory of the Wright Air Development Center initiated a project to investigate the flutter characteristics of all-movable tails. The first phase of this project, subsonic wind tunnel tests of an unswept stabilizer flutter model, is reported here. Subsequent phases will include subsonic tests of a swept back model and transonic tests.

The present investigation consisted of two parts. First, a series of tests were conducted to determine the effect of varying the rotational restraint of an all-movable stabilizer on the flutter speed. These tests were performed for three locations of the axis of rotation. A second series of tests were then run to determine the influence of stabilizer rotational free play on the flutter characteristics of a particular case. This report presents a description of the model including its mass and elastic properties, the zero airspeed vibration modes and frequencies for all configurations tested in the wind tunnel, and finally the wind tunnel flutter data.

The vertical bending of a fuselage was not simulated in the model used for this investigation. This mode of vibration is expected to influence the flutter test data appreciably for low rotational frequencies of the all-movable tail. The Wright Air Development Center plans to investigate this effect by further wind tunnel tests in a future phase of the all-movable stabilizer flutter research program.

VOL. XXII NO. 5 July/August 2010

Election Time at TRA! Please Vote

HAPPENINGS AT NORTHROP GRUMMAN

Aerospace Systems Sector (NGAS)

ABU DHABI, UAE, July 14, 2010) -- With the support of the United States Navy, NGAS and its industry partners (Sikorsky/Schweizer, Rolls-Royce, Raytheon, FLIR Systems, Cubic, Kearfott, Rockwell-Collins, General Electric, Sierra Nevada, Telephonics, and L-3 Communications) today successfully completed a rigorous set of flight demonstrations of the MQ-8B Fire Scout vertical unmanned aerial system (VUAS) in the United Arab Emirates under extreme environmental conditions. The test flights were conducted in early July over a ten-day period. They validated Fire Scout's steady system maturation and helped signal its readiness for the U.S. Navy's upcoming Operational Evaluation of the system, planned for late 2010 aboard the USS Halyburton.

By Frank Warren

Information Systems Sector (NGIS)

SAN PEDRO, CA — NGIS has received an indefinite-delivery/indefinite-quantity (ID/IQ) award from the U.S. Air Force to provide mission planning software systems and tools so that warfighters can quickly and effectively plan missions and transfer required data to aircraft avionics. NGIS is one of five companies that received an award under the Mission Planning Enterprise Contract II from the Electronic Systems Center, Air Force Materiel Command, Hanscom Air Force Base, Mass. The companies will compete for delivery orders with a potential value of $919 million collectively over a five-year base period and five-year optional terms, making the potential period of performance 10 years.

Each Fall TRA nominates its Officers and Members-at-Large for the coming year. Then it's your responsibility as members to ratify these nominations or nominate other candidates. By nominating just one candidate for each position, we avoid the disappointment that can happen when a person agrees to run, then does not win the election.

Officers serve for a one-year term, while the Directors-at-Large are elected for two years. These longer terms for the latter group help bring continuity to the management and daily operation of TRA. Directors-at-Large are limited to six successive years (three terms) while Officers may serve only two consecutive terms, with the exception of the Treasurer, who may serve up to five consecutive terms.

Please take the time to vote. Your votes show that you support the nominating committee and those other hard-working individuals that help make TRA strong.

You can vote by e-mail or by completing the enclosed ballot and mailing it in. Just follow the instructions on the ballot.

Electronic Systems Sector (NGES)

CHARLOTTESVILLE, Va. — NGES has been selected to supply the bridge navigation systems for three new bulk carriers being built in China for Italian ship-owner Deiulemar Shipping. Each of the ships is to be fitted with the company's Sperry Marine VisionMaster FT S- and X-band radars, gyro-compass, autopilot, steering control, speed log, echosounder, voyage data recorder, and other navigation systems. The equipment is being supplied through Telemar, the sales and service representative for Northrop Grumman Sperry Marine products and systems in Italy. Telemar will oversee the installations and provide technical support and service for the shipboard navigation systems. The 176,000 deadweight ton ships are on order from New Century Shipbuilding Company's New Times Shipbuilding yard in Jiangsu, China. They are due for delivery to Deiulemar in 2010/2011.

Aerodynamic Analysis Of A Statue

During the summer of 1958 I was summoned to the office of Will Duke, Vice President and Associate Director of the Systems Engineering Division, Space Technology Laboratories.

He said that Jimmy Doolittle, the Chairman of the Board of STL, wanted an aerodynamicist to perform a loads analysis of a statue. It seemed that the Order of Daedalians, a group of Air Force officers, all retired and many of General rank, who had been Army Air Corps pilots in the 1920's, wanted to give a gift to the recently established Air Force Academy at Colorado Springs. The intended gift was to be a statue of Daedalus, the mythical Greek who fashioned wings of wax for himself and his son, Icarus, to enable them to escape their island imprisonment.

General Doolittle was concerned that high winds (up to 70 mph) sweeping down from the Rocky Mountains toward the Academy might damage the sculpture or tear it off its pedestal.

I visited the sculptor at his studio in Pasadena, where I was shown a one-tenth scale model of the sculpture: a man with arms wide-spread, a wing attached to each arm, and mounted horizontally on a vertical pedestal. When completed at full scale, the pedestal would be 10 feet tall, the wing span about 16 feet, and the man, 6 feet.

Back at STL, I approximated the wing shape, selected a NACA airfoil that nearly matched the wing camber, and estimated the lift and drag coefficients. I then calculated total forces, moments, and load distribution, assuming a 70 mph wind encountering the winged man at a high angle of attack.

From these I determined the bending moments at the wing root, the force tending to lift the man off the pedestal, and the force tending to topple the pedestal.

I communicated these results to the sculptor, with some suggestions as to what portions of the sculpture needed to be strong enough to sustain the loads. I reported the same to Dr. Duke and gave him my analysis and calculations. I had hoped to be allowed to present the same information to Dr. Doolittle, but Duke reserved that privilege for himself.

About a week later I received a phone call from Dr. Doolittle's secretary. She conveyed his thanks to me for my work and then told me that Gen. Doolittle and Gen. K.B. Wolfe met with the sculptor, viewed the model, and decided it was an inappropriate gift.

NEW SPACE SHIP HAS AIRPLANE ATTACHED

1964-07-04-san-pedro-daily-news-pg-9-clip-new-space-ship

By FRANK MACOMBER
Miltary-Aerospace Writer
Copley News Service

REDONDO BEACH, Calif.—Space Technology Laboratories here has come up with a new space vehicle named Janus.

It is a spaceship with an airplane attached.

Janus' performance characteristics are outlined in a paper written by I. N. Spielberg and C. B. Cohen, assistant directors of STL's Aerospace Laboratory.

Janus is a spacecraft with a subsonic, turbojet airplane built into its structure. Weighing only about 16,000 pounds, the blunted, half-cone shaped spaceship resembles half a baked potato.

Spielberg and Cohen say it could carry three atronauts on a two-week earth-orbiting mission. On reentry, the airplane would be separated at about 50,000 feet and, with a landing speed of only 120 miles an hour, it could be maneuvered to any airport within its 200-mile range.

Meanwhile the pod or spacecraft would float to earth on parachutes for reuse.

Recalling that 15,000 people and a virtual fleet of ships and planes were involved in the Mercury manned flight recoveries, the STL engineers claim Janus appears to be as economical as it is scientific.

After providing for life support systems there still is 860 cubic feet of usable space for all the scientific equipment needed for a 14-day mission.

"With a Titan III or Saturn I booster additional tons of payload could be carried," the paper says.

The airplane weighs only 4,000 pounds and carries the spacecraft's communications and airplane navigation equipment.

"As we progress into the more sophisticated spacecraft of the 1970s, Janus-type spacecraft could be used for space station-to-earth shuttles, or as a test station, command and communications satellite or manned early warning space station," the Spielberg-Cohen paper points out.

Cutaway view of the Janus spacecraft. Image credit: U.S.Patent Office.

In 2013, while spending a gleeful Sunday afternoon searching through old patent applications (don't judge me), I stumbled upon an intriguing design for a piloted spacecraft using "staged reentry." I wrote about it on my old Beyond Apollo blog on the WIRED website.

In 2017, I expanded that post with more context details on the history of lifting body research and better illustrations and posted it on this blog (see the link at the end of this post). At the time, the patent application, filed in January 1964 by TRW engineers C. Cohen, J. Schetzer, and J. Sellars and granted in December 1966, remained my only source of information on the staged reentry concept.

No longer. One benefit of working at a university is that journal articles formerly locked up behind paywalls, out of reach of independent scholars on a budget, are now readily accessible. Last month, while spending a gleeful Sunday afternoon searching through the **1965 volume of *The Journal of Spacecraft & Rockets*, I stumbled upon a staged reentry design named for Janus, the two-faced Roman god of endings and beginnings. Closer examination confirmed**

that the Janus spacecraft was indeed the unnamed spacecraft of the 1966 patent.

Janus is an apt name for the proposed spacecraft design, because its most unique features are related to launch and (especially) landing - that is, the beginning and ending of its mission**. The name was first used in a confidential May 1962 TRW Space Technology Labs report by I. Spielberg and C. Cohen.**

Spielberg, whose name does not appear on the patent application, presented the staged reentry concept at the first conference of the American Institute of Aeronautics and Astronautics in Washington, DC (29 June-2 July 1964) along with Cohen, whose name was the only one to appear on the 1962 report, the 1964 presentation, the 1965 *Journal of Spacecraft & Rockets* paper based on the presentation, and the 1966 patent. It seems likely, given his continuous involvement, that Cohen originated and championed the Janus staged reentry concept.

Patent applications are not engineering papers; or, perhaps, one may say that lousy is the engineering paper that reads like a patent application. In addition to being more readable, the 1965 Spielberg and Cohen paper provides considerably more detail than the patent application.

The TRW engineers explained the rationale behind the staged reentry concept:

> A manned system should provide precision and flexibility in its landing characteristics. It should be capable of routine launch and routine return without a large recovery task force. Moreover, these criteria must be satisfied without curtailing payload volume or weight or reducing the reliability of reentry protection. In general, these requirements conflict, since efficient entry vehicles (e.g., blunt lifting bodies) have poor landing characteristics, whereas vehicles that land well (winged configurations) tend to have low volumetric efficiency and serious reentry design problems. The staged reentry concept. . . circumvents the difficult design compromises that otherwise must be made to ensure good landing qualities, high volumetric efficiency, and desirable reentry characteristics.

The Janus spacecraft comprised two parts that would separate in flight. The largest part was a 26.8-foot-long, 16-foot-wide, 10-foot-deep "pod." Designed to carry three astronauts, it was an 11,660-pound half-cone lifting body with flat aft and top surfaces and a curved, blunt nose.

The TRW engineers described the pod's double-walled structure. Its inner hull, the pressure vessel, would be manufactured from aluminum sheet. The outer hull would be made of aluminum honeycomb with aluminum alloy plates for added strength. Aluminum frames with "I" and "Z" cross-sections would link the two hulls. An ablative heat shield (that is, one that chars and erodes to carry away heat) would cover the aluminum honeycomb, and low-density insulation would fill the space between the inner and outer hulls.

The other part of the Janus spacecraft was a 4000-pound delta-wing jet aircraft measuring 21 feet long, 13.3 feet across its wings, and 5.33 feet tall. It would include twin downward facing rudder fins and a belly-mounted air intake feeding a Continental 356-23 turbojet engine. The engine could be started at 18,000 feet of altitude using ambient air or at up to 45,000 feet with supplemental oxygen. Cruise speed at 30,000 feet was about Mach 0.6 (370 knots) and range with a full load of 77 gallons (500 pounds) of jet fuel was 200 nautical miles.

The flat top of the small jet would form the largest part of the top of the lifting body. The jet's underside would form the "ceiling" of the lifting body's 860-cubic-foot pressurized internal volume; that is, the plane's belly, including its air intake, would protrude into the main crew living and working space. Ceiling height, though variable, would measure no less than seven feet.

The jet would ride on three rod-like "pneumatic/explosive actuators" attached to the pod. Latches would link the actuators to holes in the plane's nose and on the underside of its wings. Other latches would anchor the jet's wing leading edges.

Spielberg and Cohen recognized that creating an air-tight seal between jet and pod would pose significant design challenges. They proposed an inflatable or "fluted" (grooved) gasket, presumably made of a rubberized fabric. They admitted that their seal system, though "feasible," was not yet "optimized."

Atop a booster on the launch pad, jet and lifting body would point their noses at the sky. Spielberg and Cohen envisioned that the flat aft surface of the pod would sit atop a launch vehicle adapter that would measure 10 feet in diameter where it linked to the pod. The bottom of the adapter would match the larger diameter of the launch vehicle upper stage.

Just before launch, the astronauts would pass through a hatch in the side of the adapter. Overhead they would see the flat aft surface of the pod, which would include a round hatchway. The hatchway would lead into a cylindrical airlock just large enough to hold one space-suited astronaut. A round hatch in the airlock would in turn lead into the pod. In the near-vacuum of low-Earth orbit, the airlock would permit astronauts to spacewalk without depressurizing the pod.

Forward-facing crew couches would be arranged single-file, one behind the other, in a line beneath the jet fuselage. This would place the astronauts one above the other on the launch pad.

The pod would contain the Janus spacecraft main control console. Intended for use in orbit, it would be mounted on the pod's aft interior wall next to the inner airlock hatch. This would place it out of reach of the reclining astronauts. Critically important controls would be mounted on couch arms.

The patent application said nothing about possible launch vehicles, but in their paper Spielberg and Cohen specified two candidates: Titan III (probably the Titan IIIC variant) and Saturn C-1 (otherwise known as Saturn I). The former could boost 28,000 pounds into the 140-nautical-mile orbit required to forestall orbital decay long enough to carry out a two-week Janus mission; the latter, 20,000 pounds. The total weight of the Janus spacecraft (crew, pod, and jet) was 15,660 pounds, so in theory it could transport 12,340 pounds of unspecified payload if launched on a Titan III and 4340 pounds if launched on a Saturn C-1.

It is worth noting that Janus included no docking mechanism, and that was it not designed to perform significant maneuvers in space (apart from a deorbit burn). This ran against the grain of NASA requirements in the first half of the 1960s, when both Gemini and Apollo were under development. Though it could carry a hefty payload, it could not deliver it anywhere. Presumably, this meant that its payload would always take the form of equipment that would remain inside the pod. It is conceivable, however, that small payloads could be tossed out its airlock and larger ones assembled outside by spacewalkers — Spielberg and Cohen did not, however, suggest these possibilities.

A successful mission would begin with launch from Cape Kennedy on Florida's east coast. The launch vehicle would ascend vertically, then roll toward the southeast on a course that would avoid Caribbean islands and South America. About 10 minutes after liftoff, Janus would reach its operational orbit and separate from the upper stage of its launch vehicle. The crew would then unstrap from their couches and begin work in the pod's large pressurized volume.

They would also work in the jet cockpit. The jet's glass canopy, which would stand higher than the rest of the Janus spacecraft's mostly flat top, would make

the cockpit the prime spot for conducting Earth and astronomy observations.

Spielberg and Cohen proposed a novel method for entering and leaving the cockpit. The crew couches would each be mounted on a pair of rails, and the underside of the jet's fuselage would include automatic doors. Operating controls on the couch arms would cause the doors to open and the couch to ride the rails from pod to cockpit and vice versa. The TRW engineers explained that a single set of couches shared between the pod and the jet would save weight, though with the large Janus payload capability this would probably have been a minor concern.

The crew would breathe a 47% oxygen/53% nitrogen air mix at a pressure of 7.5 pounds per square inch. Water for crew needs would come from fuel cells, the primary task of which would be to generate 2.5 kilowatts of continuous electricity by combining liquid hydrogen and liquid oxygen. Fluid circulating in pipes in the pod walls would gather and carry waste heat from the pressurized volume and the fuel cells to a radiator mounted on the pod's aft surface.

For return to Earth, the astronauts would sit in their couches in the pod, turn the Janus spacecraft using small thrusters so that its aft end pointed in its direction of motion, and ignite its 1100-pound solid-propellant retrorocket. After burnout, the retrorocket casing would be cast off and Janus reoriented with its nose aimed forward. Descent toward 400,000-foot reentry altitude would last 14 minutes. At start of reentry, the Janus spacecraft would be moving at about 250 feet per second (fps).

Reentry would be a balancing act. The lifting-body pod would need trim flaps for stability and steering; however, four trim flaps attached in pairs to the bottom edge of its flat aft surface would tend to tip its nose down (that is, give it a negative angle of attack). This would permit hot reentry plasma to course over the pod's top surface, destroying the jet canopy. At the same time, the pod would be tail-heavy, raising its nose and making it aerodynamically unstable.

Spielberg and Cohen proposed a two-part solution: cautiously reshaping the pod's nose and packing its triangular nose volume with heavy subsystems (for example, the fuel cells and their reactants). The former would tend to level its angle of attack and the latter, they calculated, would shift its center of gravity forward to a point 54% of its length (about 11 feet) aft of the pod's nose, yielding a slightly "nose up" angle of attack. The pod's nose would thus bear the brunt of reentry heating, and no reentry plasma would reach the jet canopy

The Janus spacecraft would reenter at a very shallow angle (just 2°). It would thus shed speed gradually in a low-density atmosphere, preventing maximum deceleration from exceeding 1.9 gravities. An automated attitude control system would operate the trim flaps and small thrusters to maintain stability as the pod descended.

During reentry, the outer hull, safe behind its heat shield, would maintain a temperature below 600° Fahrenheit (F). The inner hull would remain at 70° F throughout the mission. The hot outer hull would tend to expand. If the aluminum frames linking the inner and outer hulls were rigidly attached at both ends, differential expansion would tear them apart. To avoid this, Spielberg and Cohen proposed that the frames be attached to the outer hull by flexible connections and to the inner hull by rigid ones.

A little less than 12 minutes after reentry start, at an altitude of about 120,000 feet, the Janus spacecraft would slow to a velocity of about 50 fps. Deprived of lift, its angle of descent would increase in a little over a minute to about 55°.

At 50,000 feet of altitude, the Janus spacecraft would slow to subsonic speed and begin to lose stability. The mission commander would activate the motors that would raise the three couches into the jet cockpit. Beneath the astronauts' feet, the fuselage doors would close and seal. At 45,000 feet, the spacecraft would slow to Mach 0.9, and jet separation from the pod could occur.

Separation would begin with a command to fire explosive bolts. This would release the latches linking the jet to the pod so that the three rod-like pneumatic actuators could extend, pushing the jet away from the pod with a jolt. The pressure seal would be breached, exposing the pod's interior to the outside environment.

The commander would ignite the jet's engine and fly at a cruise altitude of 30,000 feet to a waiting airfield up to 200 nautical miles away. The jet would land on a nose wheel and skids attached to the ends of its rudder fins. The pod, meanwhile, would deploy parachutes from its aft surface and descend to a landing on its nose.

In the event of an abort on the launch pad or during first-stage operation, a pair of solid-propellant abort rocket motors mounted on the pod's aft surface outside the adapter linking it to the launch vehicle would ignite to boost the Janus spacecraft up and away. The motors would propel it to an altitude of 6600 feet in 19 seconds. If no first-stage abort took place, the abort motors would eject after second-stage ignition so that the launch vehicle would not need to carry their weight to orbit.

The deorbit rocket motor would play two possible abort roles: in an abort off the launch pad, it could be ignited after the twin abort rocket motors burned out to boost the Janus spacecraft higher and farther downrange, providing more time for successful jet separation; it would also become the primary abort rocket motor after the twin abort motors ejected.

An abort within 200 nautical miles of Cape Kennedy would see the commander separate the jet from the pod as during a normal descent, then fly back to the launch site. The jet could also remain attached to the pod throughout the abort, in which case the entire Janus spacecraft would descend nose down on parachutes to a landing or splashdown at 25 feet per second. Spielberg and Cohen included 1030 pounds of recovery gear in the Janus spacecraft mass budget.

Down-range aborts — for example, during second stage flight — would occur over open ocean, placing land — never mind suitable airports — outside the jet's 200-nautical-mile range. Spielberg and Cohen noted that the lifting body would during second-stage flight be high enough to use its trim flaps and steering thrusters to maneuver closer to land. This would, they judged, permit jet separation within 200 miles of airfields on Caribbean islands or in northeastern South America.

Here is the link to my staged reentry post based only on the Cohen, Schetzer, and Sellars patent of December 1966. In addition to a summary history of lifting body development in the United States, the post contains detailed labeled drawings from the patent application.

Workum scholarships helped former Cincinnatians

A scholarship for a college education made all the difference in the world in the lives of two prominent former Cincinnatians. Though now firmly rooted in California, both Irvin Spielberg and Shirley Pine Riskin remember, and continue to acknowledge, the roll that the Workum Scholarship Fund played in enabling them to pursue higher educaiton and become the productive citizens they are today.

Now in its 78th year, the Workum Fund continues to aid Jewish college students in whatever way best serves their needs and the times. Emphasis for the past nine years has been to provide college students with career-related Jewish communal job experiences through the Summer Internship Program.

However, nearly 60 years ago, when Irvin Spielberg, now of Pacific Palisades, but then a senior at Walnut Hills High School, Workum provided financial scholarships so promising students could fulfill their potential.

"If it hadn't been for the scholarship and Mrs. Irvin Westheimer (who interviewed me for the scholarship), my life might have been totally different in ways I couldn't imagine," Spielberg said.

"I faced the prospect of paying my own way to college, which in the 1930s was highly unlikely, or not going. Both my parents were immigrants. I was the first in my family to go to college."

With the Workum Scholarship of about $200 per year plus money for books and fees, Spielberg was able to attend the University of Cincinnati College of Engineering and the embark on a successful engineering career. He worked as an aeronautical engineer at Wright Field in Dayton, with interruptions for military service in World War II and the Korean War. He also continued his education with a master's degree from Harvard. Then, in 1956, he moved to California and worked in the aeropsace industry until his retirement in 1986.

Irvin Spielberg

Shirley Pine Riskin

"Workkum started me on a career that led to interesting and challenging work, a happy family life, and travel to all parts of the world," Spielberg said. He and his wife (former Cincinnatian Frances Fabe) have been married for 45 years and and have three children and five grandchildren.

Spielberg believes he owes a considerable debt to the Workum Foundation. "I've been engaged in a 'repayment program,'" he said. "to help Workum support other promising needy students. "I feel that I owe something back to the fund," he said.

Riskin also feels a sense of indebtedness to Workum.

"Workum made it possible for me to go to college; probably made it possible to marry the man I did; enriched my life; and expanded my horizons," Riskin said.

The daughter of immigrants, she was among the first in her family to go to college.

"I wanted to go to college," she said. "I loved to learn and to read. I wanted the answers to so many questions."

With a four-year Workum scholarship, she went to UC and majored in philosophy. Riskin credits that with helping her have a successful first-date with her husband-to-be.

"We talked about Franz Kafka. I never would have known about Kafka unless I had gone to college."

But more than Kafka, Riskin gained confidence in her intellectual abilities and in her ability to relate to people of all educational backgrounds. She parlayed these skills into a very active and productive volunteer career.

In addition to involvement with her children's schools, she has been intensely involved in community work. She began and edited the newsletter for the Friends of the Palo Alto Library and served on its board a number of years. She helped pioneer recycling in Palo Alto; she was active in Physicians for Social Responsibility; she was active in the League of Women Voters and did a study on bottle bill tax legislation.

Now living in Santa Cruz, she has taken on a volunteer job to raise fellowship money for the American Association of University Women.

Though she has lived in California for 35 years, Riskin recontacted Workum in recent years in order to be able to leave the fund a bequest. "I have always been grateful to Workum," she said.

This is the first of three articles in a series about the Workum Scholarship Fund, a project of the National Council of Jewish Women, Cincinnati Section.

Contributions to the fund may be sent to Sylvalee Kaplan, 16 Diplomat Drive, Cincinnati, OH 45215.

Irvin Nathaniel Spielberg

December 18, 1918 - February 19, 2015 Irvin Nathaniel "Buddy" Spielberg died February 19th at his home in Pacific Palisades. Born in Cincinnati, OH, he attended Walnut Hills High School and the University of Cincinnati. He served in the Army Air Corps as a flight engineer on a B-29 in the South Pacific in WWII before going to Harvard University for his Masters in Aeronautics. After working at Wright Field in Dayton, OH, he took a job in the aerospace industry in Los Angeles in 1956, where he worked until 1986. After retiring, he volunteered for many years at Recording for the Blind. He is survived by his wife of 64 years, Frances Fabe "Peachy" Spielberg and his children Ginny Gibbs (Michael), Jack Spielberg (Sarah Seaver), and Fred Spielberg (Guadalupe Verdejo) and grandchildren Jonathan, Lydia, Lindsay, Nathaniel, and Victor. He is also survived by his brother, Arnold Spielberg of Pacific Palisades, and predeceased by his sister, Natalie Spielberg Guttman of Cincinnati. Buddy was a gentle and generous man, concerned with civil rights, inequality, the environment and the Vietnam War during the 1960s. Donations in his memory can be made to Recording for the Blind (Learning Ally) c/o Financial Development, 20 Roszel, Princeton, NJ 08540.

See [HC004J][GDrive]

Irvin Nathaniel ("Buddy") Spielberg, died Thursday night, 19 February 2015, at his home in Pacific Palisades, CA, at the age of 96, following a short illness. Born on December 18, 1918, and raised in Cincinnati, OH, he was the middle son of Ukrainian Jewish immigrants who arrived in the early 20th Century. Growing up in a liberal New Deal family during the Great Depression, he dreamt of studying medicine as a child, however, his family's financial situation and the onset of WW II pushed him into a work-study program in engineering at the University of Cincinnati. Upon graduation, he served the US military as an aeronautical engineer at Wright Field in Dayton during the early years of the war. Called to active duty in 1944, he was posted to the Pacific theater in the 313th Bomb Wing, 504th Bomb Group, 421st Bomb Squadron of the Army Air Corps. As the flight engineer of an eight-person B-29, Buddy flew dozens of long-haul missions between Tinian, Saipan, Iwo Jima, the Philippines and Japan, during the final months of the war. **He returned to civilian life in 1946, but was called back to active duty in Korea in the early 1950s, reaching the rank of Lieutenant.**

Buddy attended Harvard University on the GI Bill and earned a Master's of Science degree in aeronautical engineering. He married Frances (Peachy) Fabe in Cincinnati in 1950, and **left the Midwest in 1956 to accept a post with Ramo Wooldridge, later Space Technology Laboratories, later Thompson Ramo Wooldridge or TRW.** A specialist in aircraft flutter and rocket trajectory, Buddy gradually moved from flight engineering into aerospace projects, working on some of the emblematic space exploration initiatives of the 1960s and 1970s, including the Pioneer, Gemini and Beyond Jupiter projects. He also worked on anti-ballistic missile weapons systems, but vastly preferred aerospace technology.

Buddy was a gentle and generous man, concerned with civil rights, inequality, the environment and the Vietnam War during the 1960s. He and Peachy enjoyed hiking, traveling, theatre, and entertaining. After he retired, he volunteered at Recording for the Blind, reading and explaining mathematics, physics, and engineering text books. He loved Mozart operas, Zane Grey novels, the Cincinnati Reds and his family above all else.

He is survived by his wife of 64 years (Frances); his three children (Virginia, John and Frederick); his five grandchildren (Jonathan, Lydia, Lindsay, Nathaniel and Victor); and his elder brother, Arnold. He was predeceased by his younger sister, Natalie. By his own wishes,

Wright Field

Wright Field map.jpg

Beginning in the 1910s, with World War I's outbreak, the United States government began investigating the use of airplanes in war. In 1913, President Woodrow Wilson created the National Advisory Committee on Aeronautics (NACA). This committee suggested establishing a center to research the use of airplanes in the military and also to seek improvements in airplane technology. Due to the presence of several automobile and aircraft plants in Ohio, the NACA established this center at McCook Field in Dayton, Ohio.

By 1924, the United States Air Corps had outgrown the facilities at McCook Field. Hoping to keep the Air Corps in Dayton, the city officials and residents donated 5,250 acres of land on the city's outskirts. The Air Corps accepted the land and built Wright Field on the site. The base was named Wright Field to honor Orville and Wilbur Wright's contributions to flight. The Wrights had tested many of their early airplanes in the vicinity of Wright Field. Wright Field formally opened in 1927.

formally opened in 1927.

In 1926, the United States government created the Army Air Corps, replacing the earlier Air Corps. The Army Air Corps stationed its Materiel Division at Wright Field. Here, scientists continued to improve aircraft. The scientists also realized that they had to work together to create the best possible plane. Before creation of the Army Air Corps, researchers studied individual parts of the plane, like engines, armor, wings, and propellers. Now scientists continued to specialize in individual components of planes, but they realized that changes in a plane's armor would affect all other parts of the plane. The same held true for changes in engines, wings, and the other parts of a plane. Under the Army Air Corps, the researchers now kept a dialog open between the various experts.

Despite Wright Field's existence, the United States Army Air Corps entered World War II at a severe disadvantage numerically and technologically when compared to the Air Forces of other nations. To help overcome these weaknesses, the federal government, in 1940, designated 300 million dollars to improve Wright Field and to create an Air Corps with at least 5,500 planes. In 1941, only forty buildings existed at Wright Field, but by 1944, the airfield consisted of more than three hundred buildings. During World War II, research continued on airplanes, with much attention focused upon improving the horsepower of plane engines, airplanes' ranges and maneuverability, safety features for crews, and weapons. Workers at Wright Field helped to design and to construct numerous airplanes, such as the C-47 Skytrain, the C-54 Skymaster, the Curtiss C-46 Commando, the Sikorsky XR-4, the Curtiss-Wright P-40 Warhawk, the B-24 Liberator, and the B-29 Superfortress, among many others, during World War II.

Upon World War II's conclusion, Wright Field continued to play a major role in aircraft research and construction. In 1947, the United States government created the United States Air Force, eliminating the Army Air Forces and establishing a new branch to the United States military. That same year, the Air Force combined Wright Field with nearby Patterson Field, creating Wright-Patterson A

Leon Alfred TOlve

Family-Placed Death Notice

Leon Alfred Tolve

Leon Alfred Tolve, 88, of Memphis and Marietta, Georgia, retired Division Engineer in charge of the Aeromechanics Division of Lockheed Aircraft, now Lockheed Marietta, died at Baptist Hospital on May 29, 2004. Graveside Services will be conducted at Elmwood Cemetery, Memphis, TN at 3:00 PM on June 1, 2004. He graduated from Georgia Institute of Technology in 1938. During World War II, he served as a Design Engineer at the Army Air Corps Aeronautical Research Center at Wright Field, Dayton, Ohio, where all U.S. World War II aircraft were developed. At Lockheed, he was in charge of over 100 engineers involved in the development of the C-130, C-141 and the C5A, the world's largest aircraft. After retirement, he served as a consultant in aeroelasticity (vibration and flutter), and served as a consultant on the design of HondaJet which will go into production in September 2004. He is survived by a niece, Nancy T. Gibson of Memphis and two great-nephews and a great-niece. The family request that memorials be sent to Georgia Tech Foundation, Inc. 760 Spring Street, N.W., 4th Floor, Atlanta, Georgia 30308. Canale Funeral Directors.

Does Hangar 18, Legendary Alien Warehouse, Exist?

Crashed UFOs, alien autopsies and government cover-ups—untangling the legend surrounding Ohio's Wright-Patterson Air Force Base.

SARAH PRUITT

Gremlin/Getty Images

As home to Project Blue Book, ground zero for government investigation of UFOs from 1951 to 1969, Wright Field (now Wright-Patterson Air Force Base) outside Dayton, Ohio, ranks up there alongside Area 51 as a subject of enduring speculation.

Many of the rumors surrounding Wright-Patt, as it's known for short, involve what might have gone on inside a particular building, known as Hangar 18. UFO enthusiasts believe the government hid physical evidence from their investigations—including flying saucer debris, extraterrestrial remains and even captured aliens—in this mysterious warehouse, specifically inside a sealed, highly guarded location dubbed "the Blue Room."

The legend of Hangar 18 goes back to the supposed crash of a UFO in the desert near Roswell, New Mexico, in July 1947. According to a press release issued by the Roswell Army Air Field (RAAF) at the time, their personnel inspected the "flying disc" and sent it on to "higher headquarters." A subsequent press release from an Air Force base in Fort Worth, Texas (assumed to be the aforementioned headquarters) claimed the disc was a weather balloon—a

claim the Air Force acknowledged was untrue in 1994, admitting it had been testing a surveillance device designed to fly over nuclear research sites in the Soviet Union.

READ MORE: What Really Happened at Roswell?

But in addition to Fort Worth, many UFO researchers believe some of the materials from Roswell were also transported to Wright Field after the crash and stored in Hangar 18, based on unsubstantiated reports from former military pilots. One, Oliver Henderson, reportedly told his wife that he flew a plane loaded with debris, along with several small alien bodies, from Roswell to Wright Field. According to the children of another pilot, WWII ace Marion "Black Mac" Magruder, their father claimed to have seen a living alien at Wright Field in 1947 and told them "it was a shameful thing that the military destroyed this creature by conducting tests on it."

Senator Barry Goldwater of Arizona, the Republican nominee for president in 1964, was notoriously fascinated by UFOs and Hangar 18. Goldwater said publicly that he tried to gain access to the Blue Room in the early '60s, but had been denied access by a furious General Curtis LeMay.

Even after Project Blue Book wrapped up in 1969, rumors continued to swirl around Wright-Patt. In 1974, a Florida UFOlogist named Robert Spencer Carr publicly claimed that the Air Force was hiding "two flying saucers of unknown origin" inside Wright-Patterson's Hangar 18, according to a report in the Tampa Tribune. Carr claimed to have a high-ranking military source, who saw the bodies of 12 alien beings while autopsies were being performed on them. Though Carr's claims were dubious, widespread media coverage of them, as well as the release of the 1980 movie Hangar 18, helped cement the legend of Wright-Patt as a hotbed of the government's UFO-related activities.

READ MORE: Project Blue Book

For its part, the Air Force has categorically denied the rumors, and maintains there has never actually been a Hangar 18 anywhere on Wright-Patt, though there is a Building 18.

"Periodically, it is erroneously stated that the remains of extraterrestrial visitors are or have been stored at Wright-Patterson Air Force Base," the Air Force said in an official statement issued in January 1985. "There are not now, nor have there ever been, any extraterrestrial visitors or equipment on Wright-Patterson Air Force Base."

Papers of Rudi Berndt, WPAFB Engineer via Operation Paperclip, Now Open for Research

Posted on December 5, 2018 by Lisa Rickey

We are pleased to announce that MS-632: Rudi Berndt Papers is now open for research.

Rudi Julius Berndt (1921-2004) was a German engineer who came to the United States as part of Operation Paperclip (or Project Paperclip), a secret program of the Joint Intelligence Objectives Agency to recruit leading German scientists, engineers, and technicians at the close of World War II (before the Russians did).

Berndt's particular area of expertise was parachute development. From 1941 to 1946, he was a member of the parachute research and development team at the Graf Zeppelin Research Institute Stuttgart-Ruit, working alongside such leaders in the field as Helmut Heinrich and Theodor Knacke.

At age 25, Berndt was one of the youngest recruits for Operation Paperclip. He began his employment with the U.S. Army Air Services in the autumn of 1946, coming to Dayton to start his work at Wright Field in November. Berndt dedicated over 40 years of his life to civilian service at Wright-Patterson Air Force Base, retiring in 1990.

The manuscript collection primarily documents Berndt's work in parachute development, in both Germany and the United States, from the WWII era through the Cold War. Educational records, as well as a significant amount of material pertaining to Berndt's arrival in the United States as part of Operation Paperclip, are also included. Of particular note are Berndt's memoirs, which describe his early life in Germany through his retirement.

Interview with

Mr. Irvin N. Spielberg

(WW II - B-29 Flight Engineer - Tinian & Philippine Islands)

Date of Interview: November 6, 2003

Admiral Nimitz Historic Site

National Museum of the Pacific War

Fredericksburg, Texas

Interview with Mr. Irvin N. Spielberg

(WW II – B-29 Flight Engineer - Tinian & Philippine Islands)

My name is Richard Misenhimer. Today is November 6, 2003. I am interviewing Mr. Irvin Spielberg by telephone. His phone number is 310-454-4750. This interview is in support of the National Museum of the Pacific War's Center for Pacific War Studies for the preservation of historical information related to World War II.

Mr. Misenhimer: Mr. Spielberg I want to thank you for taking the time today to do this interview.

Mr. Spielberg: You are welcome.

Mr. Misenhimer: Let me ask you – do you have a middle initial?

Mr. Spielberg: Yes. The initial is "N". It stands for Nathaniel.

Mr. Misenhimer: What is your mailing address?

Mr. Spielberg: 234 Notteargenta Road, Pacific Palisades, California 90272.

Mr. Misenhimer: Thank you, I appreciate that. I have the agreement with the Nimitz Museum, which normally when I do these interviews in person, I give to the person to read and sign, but since we are doing it by the telephone, let me read this and you can tell me if this is satisfactory. Admiral Nimitz State Historic Site, the National Museum fo the Pacific War, Center for Pacific War Studies, Fredericksburg, Texas, Oral History Project. The purpose of the Admiral Nimitz State Historical Site, National Museum of the Pacific War, Oral History Project, is to collect, preserve, and interpret the history of World War II and the role of Fleet Admiral Chester W. Nimitz by means of the tape recorded and/or video taped interview. Taped or video recordings of such interviews become part of the Center for Pacific War Studies Archives of the National Museum of the Pacific War, Texas Parks and Wildlife Department. These tape recordings will be made available for historical and other academic research by scholars and members of the family of the interviewee. Any transcription subsequently produced from the tape recordings will be conducted with the knowledge of the interviewee by the National Museum of the Pacific War. We, the undersigned, have read the above and voluntary offer the National Museum of the Pacific War full use of the information contained on taped or video recording these oral history research interviews. In view of the scholarly value of the research material, we hereby sign rights, title and interest pertaining to it to the National Museum of the Pacific War, Texas Parks and Wildlife. Is that OK with you?

Mr. Spielberg: Yes, I completely agree.

Mr. Misenhimer: Here is another question, yes or no. I give permission for excerpts from my Oral History to be used in the Nimitz Foundation Publication, the Nimitz News.

Mr. Spielberg: Yes, I authorize that also.

Mr. Misenhimer: Fine, thanks very much. Now, let me start off by asking you when were you born?

Mr. Spielberg: In December of 1918. In a month and a half I will be 85 years old.

Mr. Misenhimer: Great. December, what day?

Mr. Spielberg: December 18th.

Mr. Misenhimer: 12-18-18, right?

Mr. Spielberg: Yes.

Mr. Misenhimer: Where were you born?

Mr. Spielberg: Cincinnati, Ohio.

Mr. Misenhimer: Did you have brothers and sisters?

Mr. Spielberg: I have an older brother. His name is Arnold, who is still alive. He is approaching 87. I had a younger sister who died about ten years ago.

Mr. Misenhimer: Was your older brother in the service also?

Mr. Spielberg: Yes he was in the Army/Air Corps. He served in the CBI Theater – China, Burma, India. He was in the 490th Bomb Squadron, the so-called "Burma Bridge Busters."

Mr. Misenhimer: Where did you go to school?

Mr. Spielberg: Elementary and high school in Cincinnati, and I attended the University of Cincinnati and graduated in June of 1941 with a degree in aeronautical engineering.

Mr. Misenhimer: What year did you finish high school?

Mr. Spielberg: 1936.

Mr. Misenhimer: Did you go straight from high school to college?

Mr. Spielberg: Yes I did.

Mr. Misenhimer: When did you enter the service?

Mr. Spielberg: I entered the service the first week of January of 1943.

Mr. Misenhimer: Do you have an exact day?

Mr. Spielberg: Yes, I can look it up. I kept a log. Here it is, 11th of January 1943.

Mr. Misenhimer: Which branch did you go into?

Mr. Spielberg: I was assigned to the Army/Air Corps.

Mr. Misenhimer: Did you volunteer or were you drafted?

Mr. Spielberg: I was drafted.

Mr. Misenhimer: Did you have any choice of which branch you went into?

Mr. Spielberg: Yes, I wanted to enter the Army/Air Corps. If you will let me speak a little without questions.

Mr. Misenhimer: Certainly, go ahead.

Mr. Spielberg: I think I can give you some necessary background to what will follow as you draw out my Army experience.

Mr. Misenhimer: Sure, go right ahead.

Mr. Spielberg: As I mentioned, I was graduated in aeronautical engineering in June of 1941. As with most of the members of the senior class in aeronautical engineering, all of those who passed the physical applied for a Navy commission, including me. I never heard from the Navy up until graduation day. Not wanting to be without a job, without the volunteer commission in the Navy, I took a position at Wright Field, Dayton, Ohio, as an aeronautical engineer. I was assigned as a civil service employee to the Aircraft Laboratory.

I worked there until I was drafted. What happened is that the officer in charge of the laboratory to which I was assigned assured me that I would never be drafted, I was too important to the war effort and was classified as a "key employee" in a war industry. In any event, I got a draft notice in the middle of December 1942, abut one year after Pearl Harbor. I brought it to my supervisor, a Captain, who immediately took it up to the head personnel officer for all military personnel at Wright Field. He assured me via the Major, who was head of the Aircraft Laboratory, that I wouldn't be drafted and they would get that draft order changed. They tried their best but failed.

So in January of '43 I reported, as directed, to Fort Thomas, Kentucky. After 3-4 days of indoctrination and issuance of all GI clothing, I was transferred down to Miami Beach, Florida, for basic training in the Army/Air Corps. While there we went through the usual tests that are given to newly inducted or volunteer servicemen, and I applied for and was rated to become an Aviation Cadet to go to Pilot Training. About 1½ months into basic training I was called off of the training grounds, told to get out of my fatigues, put on a dress uniform, and go report to the Captain who was the head of the training company. I did so and he told me he had orders to relieve me from active duty, put me in the enlisted reserve corps, and send me back to Wright Field to resume my civilian job. I said, "Do I have to go?" He said, "Well, according to the way I read the orders, you are supposed to go." In addition, I had received a letter from the Personnel

Officer, a Colonel, at Wright Field urging me to return and saying I would do far more good for the war effort as an engineer working on research and development of the new Air Corps combat airplanes than I would as a soldier.

I agreed and I returned to Dayton, Ohio, to my civilian job and resumed receiving my regular civil service pay. But the notice that took me off of active duty put me on "reserve" status and said that I would be recalled in six months. Of course I called that to the attention of the personnel people at Wright Field. They once again reassured me that they would this time get me a deferment. What happened is six months later I got a notice from Fort Hayes, Columbus, Ohio, telling me I have to report there on such-and-such a date. This was roughly six months after, March of '43, when I transferred out of active duty. It would put it at about September. Sure enough, I had to report back to Fort Hayes. I was assigned to Jefferson Barracks, Missouri, and I took basic training the second time. I repeated it from the beginning. I had not finished the first basic training at Miami Beach.

Late in that second period, in about late November of 1943, I again was notified to report to the company commander and I was again being transferred to the enlisted reserve corps. Once again, there was a letter accompanying it from the personnel officer at Wright Field, urging me to return, saying that they missed me extremely because they had not been able to find a replacement. By this time I had about two years of direct experience in airplane dynamics. The officer said I would do wonders for the morale of the other civilian employees there who were also faced with possible drafting. Well, I did return. Sure enough, I spent six more months as a civilian engineer doing the same kind of work that I had been doing before, even at a higher level. At the end of that six months, once more the Army/Air Corps called me up. This time I was sent to Sheppard Field, Texas, and I took a third basic training, starting again at the beginning. It sounds impossible, but that is the way it happened. Anyway, for the third time I was called in and told that they had orders to transfer me to the enlisted reserve corps. This time I refused to go, and the Company Commander agreed. He said, "OK, stay in." When I applied again for pilot training I was told they weren't accepting candidates, that they had a pipeline full of candidates for aviation cadet. I inquired about bombardier, navigator, weather officer, and all of them were filled.

I was assigned to the Command Gunnery School at Lowry Field, which is just outside of Denver, Colorado. So I attended the Command Gunnery School and I found out that was the training ground for the enlisted men to be in charge of the central fire control system, which was an entirely new defensive system for the B-29 heavy bomber. I hadn't heard about it before, but it sounded interesting. I was about one-half or two-thirds of the way through the training; I think the training program was eight weeks and this must have been in the fifth or sixth week. I found out that at Lowry Field there was also the school for Flight Engineers on B-29's. I thought, "Heck, Flight Engineer is probably closer to my background and training as an aeronautical engineer than gunnery was." So I looked up the commander of the training group for flight engineers, introduced myself, told him my credentials - namely a degree in aeronautical engineering with over two years' of experience, and he agreed that I would be a good candidate for flight engineer. He arranged to transfer me out of Command Gunnery School to the Flight Engineers Training School.

I completed that training at Lowry Field. It was an interesting program for me. At Wright Field my work was primarily analytical to predict the vibration, flutter, and dynamic load characteristics of Air Corps aircraft, with occasional participation in ground and flight tests. Here, I was faced with the challenging task of being able to understand and know how to troubleshoot all of the electrical, mechanical, pneumatic, oxygen, hydraulic and fuel systems on an airplane that I had never been in before. Normally the flight engineer trainer spends about 3-4 months at the Boeing Company, where the airplane was manufactured, learning to be essentially an aircraft mechanic on a B-29. I had to skip all of that and I started right in where you train to become a flight engineer. Well, the one advantage that I had over the other men, where they had it all over me in terms of "how do you maintain all of the various systems of the airplane," was in cruise control. "How do you manage the fuel usage so as to achieve maximum flight range of the airplane, to be able to fly those 3,000 mile round trips from the Marianas Islands to Japan and back." That involved knowledge of aerodynamics, power plants, propulsion and fuel consumption, things like that. I breezed through that area. In fact I helped the instructor explain it.

I successfully completed the flight engineer school. That also involved flying in B-24's, which had been set up with flight engineer stations so you had the complete B-29 instrument panel, throttle controls, the mixture controls, at a station in the body of the B-24. In fact there were six such stations and six different trainees could go aboard on the flight and each would read the instruments and monitor the fuel consumption, plotting the cruise control data.

When we finished all of that training at Lowry Field, I was transferred to Maxwell Field in Montgomery, Alabama. This occurred in about October-November of 1944. There I was assigned to a skeleton crew, consisting of the airplane commander, which was the designation for the position that would normally be called pilot, and a pilot, who would normally be called a co-pilot. In the B-29 the pilot was the airplane commander, the co-pilot was the pilot. So the three of us, the airplane commander, the pilot and flight engineer, trained as a trio at Maxwell Field. This involved flying as an observer with, in my case, a trained flight engineer. In the airplane commander's-pilot's case it was a trained airplane commander. Each one learned his own position until we were allowed to fly solo. The three of us were always together on training flights.

Once we completed that transitional training at Maxwell Field, we were assigned, the three of us, to MacDill Field in Tampa, Florida; and there the rest of the crew was assembled, for a total of 11 men. There were five officers and six enlisted men. Incidentally, all of this time I was a Private. The officers were: the airplane commander, pilot, navigator, bombardier, and radar officer. The enlisted men were: flight engineer, radio operator, command gunner, right gunner, left gunner and tail gunner. So the entire crew was assembled and we began the overseas flight training, which involved not just short flights. By this time we were no longer flying with a check-out officer, but we were going solo as a crew. A simulated long range flight, like a typical combat mission, might go from Tampa, up to Minneapolis, down to Albuquerque, across to Memphis, Tennessee, and back down to Tampa. This would be done just to show what it feels like to be airborne for 8-10-12 or more hours. In those flights, my responsibility was, not only to monitor all the controls and the flight instruments, but to keep a log of the fuel consumption, to do the transfer of fuel so that we had sufficient fuel for each engine.

I guess I have to point out at this time – each engine of the four engines on the B-29 had its own separate fuel tank, and it drew fuel from that tank. Each tank held about twelve hundred gallons, and once that was exhausted, that engine would quit. But in addition, in the center section of the wing where the wing went through the fuselage, there was an additional large tank of about 1200 or more gallons. The total fuel capacity was about 5,500 gallons. It was the flight engineer's responsibility, as you burned fuel from each of the four wing tanks, to transfer fuel out of the center tank to each of them in turn, alternating so that you never unbalanced the airplane by putting too much in one wing tank in preference to the others. So we had practice doing that. We had practice keeping the flight engineer's log, which is where you record how much fuel you are consuming, for what length of time, and what speed, etc. The B-29's had no fuel flow gauges to tell us at any particular power setting , altitude, etc., that we were burning so many gallons per minute, or so many gallons per hour. What the flight engineer had to do was reset the manifold pressure, the RPM, airspeed, the altitude, the outside air temperature, and go into a series of charts that the Boeing Company prepared. In those charts you put in all of those readings and came out with a number that represented that each engine should be drawing so many gallons per minute. Using that calculated number and then the number of minutes that you were flying at that power setting, you would calculate the amount of fuel burned by all four engines.

We also had fuel gauges which weren't very accurate, but you could roughly check your calculations against that, but not very accurately. In that way you could keep track of fuel consumption during the whole flight. It kept you busy, particularly in the dark, during night missions writing down all of these

could keep track of fuel consumption during the whole flight. It kept you busy, particularly in the dark, during flight missions writing down all of these numbers, and at the same time keeping watch on the instrument panel and transferring fuel. The whole idea was that when you finished your missions and were on your way home, you had to have enough gas to get home.

We finished the overseas flight training at MacDill Field and were transferred to Mather Field, outside of Sacramento, by way of Topeka. Then we flew overseas. Our crew was split. We were not assigned to a B-29 of our own, so half of us dead-headed with one crew and the rest with another crew. We flew from to Mather Field, to Hickam Field, Honolulu, to Kwajalein by way of a refuel at Johnson Island, then on to Guam. We spent one night in Honolulu and again at Kwajalein. We arrived at Guam in the afternoon. Our airplane commander went in and got our orders. We found out then that we were going to be based on Tinian and we were assigned to the 313th Bomb Wing, 504th Bomb Group, 421st Bomb Squadron. So we flew to Tinian and there we were.

Mr. Misenhimer: What day did you arrive on Tinian?

Mr. Spielberg: I think it was 25th of June, 1945, so you see there was only two months more of the war before the Japanese surrendered. It was after the war in Europe had ended. We started flying missions almost immediately. I flew with our crew a total of eight missions, plus two more missions after hostilities ceased to drop supplies at prisoner of war camps in Japan. The first three missions were night fire bombing missions. We fire-bombed chosen cities in Japan. Our fourth mission was a daylight mission to bomb an aircraft plant in Nagoya.

Then the whole 504th Bomb Group was taken off of fire-bombing and assigned to drop mines by parachute to mine harbors, not only in Japan, but also in Korea. That was an extremely interesting adventure. I can look back at it with amusement and pride. The difficulty was that the distance was so great to Korea that you flew with half a load of gas from Tinian to Iwo Jima. Iwo Jima was in American hands by this time. At Iwo you filled up your airplane with as much gas as you could stuff into the tanks. Then you flew non-stop from Iwo Jima, across Japan, across the Inland Sea to Korea. Then once you laid your mines across the harbor, you flew all the way back to Tinian. The total flight time, not counting the ground time on Iwo Jima, from Tinian to Iwo Jima, Iwo to the target area in Korea, back to Tinian, was something like 18 hours. Time on the ground at Iwo was about an hour, maybe an hour and 15 minutes. In any event, we mined three harbors in Korea, and one in Japan. One of them was Fusan, which I think today is called Pusan. That is in South Korea. The second one, in what today is North Korea, was called Seishin. I think it has a different name today. It is way up in North Korea, almost close to Vladivostok in Siberia. They were hazardous missions I can assure you. Particularly, since all over Japan, across the Inland Sea, and over Korea we were picked up by search lights and we encountered anti-aircraft fire.

In all of the missions that we flew, though, we never once saw an enemy aircraft. We understood, although I don't know how accurate it is, that the Japanese were husbanding their aircraft in anticipation of an invasion. In any event, we were never attacked by enemy aircraft, but we did have lots of flak and were always picked up by search lights.

Mr. Misenhimer: What altitude were you flying across there?

Mr. Spielberg: These mining missions we were at six to eight thousand feet; very low and therefore very vulnerable. Also, once you have approached the harbor, you had to slow down so that you laid the mines in a string across the harbor. You didn't want to drop them all in a cluster. If you flew too fast you wouldn't drop the last one by the time you ran out of harbor. In any event it turned out to be very hazardous flying, and for which our Bomb Group, the 504th, received a Presidential Unit Citation.

Mr. Misenhimer: Back to the altitude now, did you fly at this 6,000 feet all the way from Iwo Jima?

Mr. Spielberg: No, no, when you left Tinian on a normal flight to Japan, you would try to fly at the altitude where you would get maximum range. You had to husband your fuel. That could be anywhere from 12,000-18,000 feet. On the daylight missions, you climbed up to a higher bombing altitude, such as 22,000-24,000 feet. If you went too much higher than that, the winds up high were very, very severe and the bombing accuracy was decreased. On a day mission after the bombs were dropped you sort of let the airplane gently settle down so that you could throttle back until you reached an altitude of about 12,000-14,000 feet, and then you sort of held that all the way back to Tinian. For a low altitude mission, if you tried to climb back up to a higher altitude, you used more fuel than you really wanted to, so you generally tried to hold between 6,000 and maximum 10,000 feet on the way home. That meant, on re-crossing Japan on the way back, you once again were picked up by radar-directed search lights and then encountered flak.

Let me pause for just a minute. I have given you a rush of events to just about the end of the war, or the end of hostilities. Now, jumping ahead another month, our crew was broken up in September or early-October 1945. The airplane commander and a couple of the enlisted men had enough points to be sent home immediately. Several of the others, since the crew was split up, were assigned to different crews or to different duties on Tinian. By that time I had been promoted, and on September 1, 1945 I was a Tech Sergeant. October 1st I was promoted to Master Sergeant. The T.O. for flight engineer, if you were enlisted, called for a Master Sergeant rank. In the 3rd week of October I was called in by our Bomb Group Commander. He said that many of the group's flight engineers were going home in a short time, and I was one of the few experienced flight engineers, that is with combat experience, that was left in the Bomb Group. He asked me would I like to become an officer. I said, "Well, I wouldn't mind that." He said, "What you have to do is to appear before a board at Wing Headquarters and they will ask you some questions. Since you already have experience and having an engineering degree, I don't think you will have any trouble, but please put on a clean uniform and sew your stripes on." I did all of that and appeared before the board. They asked me a few of what I think now were perfunctory questions and were very happy to approve me as an officer. I was not made a commissioned officer, a 2nd Lieutenant, rather I was given a Warrant as a Flight Officer. In any event, I was then transferred out of the Bomb Squadron, the 421st, to 504th Bomb Group Headquarters. I was designated the Group Flight Engineer and I was also appointed to the Wing Flight Engineer Board. So I was engaged in training the flight engineers of the new crews. I actually prepared a questionnaire in which I recorded as questions, "What would you do in this type of situation," basing them on actual events either that happened to our crew or to other crews that I had heard about. I also asked about emergency procedures in other situations they might get into. That I thought was quite successful.

Just to finally round out the experience, in December, or perhaps early-January of 1946, our bomb group got orders to transfer to Clark Field in the Philippine Islands. I was sent in a party of advance people to Clark Field to assess the state of readiness to receive all of the B-29's – what were the hangars like, do they have the equipment, stands to hoist engines out to change engines, etc. As part of the team we did a three-week survey and came back and reported to our Bomb Group Commander. In about a month everything was packed up on Tinian and moved Clark Field. Things were pretty disorganized there, but we gradually began to get things in shape. The runways were repaired. The Army Engineers came in and laid down steel mats. They even had concrete brought in. We gradually were bringing the airplanes up to flying status, one by one. Of course there was a lot of down time when the airplanes were sitting on the ground while we were still getting organized and repairing. Particularly the hangars had been bombed out. I guess when the American Army was capturing Clark Field from the Japanese they bombed the runways and everything.

Sometime in March of 1946, well after the war had ended, while we were trying to get the 29's back in service, we received a report in the middle of the

afternoon that a B-29 carrying a Lt General was lost somewhere between Clark Field and Okinawa. His airplane had not been heard from in several hours and it was figured that it went down somewhere between the two places. We were ordered to get every possible B-29 into flying condition, and the next morning take off to search for any signs of crew, life raft, etc. My job that afternoon was to run up the engines, check them out, check out other systems on the airplane and say, "OK, this one is flight ready for takeoff tomorrow." Toward the end of that afternoon, it must have been about 5:30 p.m., a pilot approached me. He introduced himself as Captain Bailey, and said, "I have an airplane that is ready and I want to take it up and check it out myself. I don't have a flight engineer." He wanted to know if I would be his flight engineer, and I said that I could. So I got my parachute, checked it out, and then I went to preflight that aircraft. This means that you make a preflight check of certain things, which is standard procedure for the flight engineer. Captain Bailey assured me, "Hey, I have done that already. I'm not only a pilot, an airplane commander, but I'm a flight engineer and I've checked it out already." I took his word for it.

We started to take off, all of a sudden the aircraft was filled with gasoline fumes. It was so thick that when we were about 1,000, maybe 1,500 feet, off the ground, I noticed that the pilot had passed out, slumped forward on the control wheel, his chest was pressing against the wheel, and we were heading down. As soon as I smelled gasoline, I got on the intercom, put it on "command" so it would override any other conversation on the intercom, and said that everybody should pull out his oxygen hose, put it in his mouth and pinch his nose, set the oxygen control to demand so that rather than breathing a mixture of oxygen and air, the setting lets you breath 100% oxygen. I don't know how many people obeyed me, but I did that. That is when I saw that the pilot had slumped over against the wheel. So I left my seat, left the oxygen, moved the pilot off the wheel, even shook him, but he was unconscious and I pushed him onto the bombardier's seat. I grabbed hold of the pilot, sitting in the co-pilot's seat, I shook him. He appeared to be wide awake; his eyes were open, but he wasn't aware of what was going on. I shook him and said, "Can you take control of the airplane?" I got no response, so I went back to my station and by that time I was beginning to feel "woozy". Are you interested in this?

Mr. Misenhimer: Oh yes, very much.

Mr. Spielberg: Well, I had straightened the wheel out, the control wheel, and put us in a steady climb. I went back to my station, put the mixture control in "rich", pushed the throttles forward until we had full climbing power and advanced the rpm of the engines, all four of them, so that we were in a steady climb. I happened to notice at that time the altimeter was at something like 1,800 or 2,000 feet. Then I thought this situation was so bad that I had better warn the guys in back. The pilot had agreed to take a number of enlisted men up as passengers. I put on the warning bell, telling them to bail out. We had made sure that everyone had a parachute. By this time I had been away from the oxygen tube long enough that I thought that I might pass out, so I opened the bomb bay doors, dropped the landing gear and prepared the airplane for bail out. It turned out that one of the passengers in the front compartment was a Captain or a Major, a fighter pilot who had never had a ride in a four-engine airplane and had asked if he could come along. Well I asked him if he could take control of the airplane? He didn't answer me. What happened next is, after I saw the airplane was steadied and climbing, I bailed out. As soon as my parachute opened I said, "My God, why did I do that?" I didn't know how many people in back had bailed out. I landed OK and made my way back to my base late that night. By the way, I landed somewhere north of Clark Field in the hills in northern Luzon.

In any event, I subsequently learned that the fighter pilot, Joe Howell was his name, had got into the pilot's seat, got on the radio and contacted the tower. It turned out that when I opened the bomb bay doors the gasoline fumes ceased. There were no longer any fumes. The fighter pilot, under the guidance of the tower, brought it in for a safe landing. I talked to him afterward. He said that he had to close the bomb bay doors in order to land, and when he did the fumes came back so terrible that he almost passed out during the landing. In any event, the airplane got down with just minimum damage; nobody was injured in the landing, but the pilot and co-pilot were both hospitalized. I don't know whether the pilot had lung damage or not, but he inhaled a lot of gasoline fumes. Major Howell told me the next morning that after they landed and came to a stop and opened the bomb bay doors, somebody had left the filler cap on the center wing tank off and it was still siphoning out gas. That is what filled the airplane with gas fumes. I told that story to my children. I said, "The one lesson that I learned from it is that if you have a job to do and somebody says he will do it for you, no matter how much you trust him, do it yourself because it is your responsibility." I trusted Captain Bailey to check the airplane and apparently he did not check whether that cap on the center wing tank had been loose or not. So much for my big adventure.

Mr. Misenhimer: How many others had bailed out?

Mr. Spielberg: It turned out that seven people in the back had bailed out. Of course the airplane commander, the pilot, and Major Howell, the fighter pilot had not bailed out and I think there was one other passenger. I'm not certain about that.

Mr. Misenhimer: Did those others who bailed out get back safely?

Mr. Spielberg: Yes, one boy sprained his ankle, but otherwise no one was injured. They got back safely. I came back about six hours after they did. I didn't leave the airplane until about five minutes after they did and traveled further away than their landing. In any event, that ended that episode.

I was able to leave service in June '46 and finally reached my home in July of '46. As a parenthetical note, once I was at Camp Attebury in Indiana being discharged, they asked me if I wanted to stay in the Officers Reserve Corps. I said, "Sure," and I was recalled to active duty during the Korean war. I had returned to my job at Wright Field as an aeronautical engineer, and when I was recalled to active duty I was not sent to B-29 or B-50 school. I was considered too valuable and was assigned to my regular desk duty – same work with a nice cut in pay. Eventually I got promoted to be a 1st Lieutenant, and when the Korean War ended my military career ended. Is there anything else I can fill in.

Mr. Misenhimer: I have several questions that I would like to ask you. On Tinian, which field were you stationed at? North Field or West Field?

Mr. Spielberg: North Field on Tinian.

Mr. Misenhimer: Did you ever have any contact with the 509th?

Mr. Spielberg: Yes and no. Yes because from where our B-29's were parked, you could see theirs. You couldn't come close to them because they were guarded by the biggest Marines carrying sub-machine guns that I ever saw. We could see that their airplanes did not have top and bottom forward and rear gun turrets. The four turrets were missing. We speculated that they were used for high speed reconnaissance flights so they could dash in, take photographs and dash out again. They probably gained extra speed by eliminating the additional weight and aerodynamic drag from those turrets. That was all that we knew about them. We had no idea of what the real mission of the 509th was.

I can add, that the morning that we heard that an "A" bomb had been dropped on Hiroshima – my feeling was "Why did they have to do that? We are winning the war because we are running out of targets." Every week General LeMay would announce over the radio to Japan that we are going to bomb targets from this list of cities, so be prepared. And then we would go and pick them off one-by-one. So we were running out of targets. I thought we were going to win the war by air power alone. I didn't think at that time of the humanitarian aspect of the bomb, but perhaps I rationalized it by the fact that I participated in killing

many, many people in firebombing whole towns. I sort of wrestled with my conscience whether it was the right thing for the United States to have dropped the bomb. Through the years... Do you mind my editorializing?

Mr. Misenhimer: No, no, go right ahead.

Mr. Spielberg: Over these years since then I've come to believe that it was absolutely the right thing to do. I realize now, having learned from reading various sources, that the Japanese were prepared to defend their homeland the way they had a last-ditch defense of Okinawa. That was one of the bloodiest battles of all of World War II. I figure if the U.S. Army and Marines invaded Japan, the number of deaths would have far exceeded the toll of Hiroshima and Nagasaki. Over the years I've come to believe that we did the right thing.

My airplane commander was Captain John Combs. I would like to say a few words about him. He was from Indiana. By the time he entered the service as a pilot, he already had a Masters Degree in either Chemistry or Agronomy. He was well educated. I thought he was a wonderful pilot and a wonderful commander of men. When the war ended he became a pilot for Eastern Airlines. He stayed in the Reserves. He was also called to duty during the Korean War. He was assigned to become the personal pilot for General Mark Clark in Japan. We have had several reunions with some of our crew members and he has told us stories about some of his adventures and some of the people that he ferried all over the orient, to Europe, to the United States. You should contact him and get his oral history.

Mr. Misenhimer: I would be glad to. I will get his name and phone number, but before we do that let me ask you a few more questions. As I understand, when LeMay took over 20th Air Force that he started running low level bombing missions. This was probably in March or April.

Mr. Spielberg: Yes.

Mr. Misenhimer: So your bombing missions across Japan were at the low level. Is that correct?

Mr. Spielberg: Yes. Well, low level being like nine to twelve thousand feet. The aerial mining missions were even lower, six to eight thousand.

Mr. Misenhimer: OK. Was your aircraft ever hit by anti-aircraft fire?

Mr. Spielberg: On one mission we had a hit in the rear, but it did no damage. We found a hole in the fuselage in front of the horizontal stabilizer. It was just a small tear.

Mr. Misenhimer: Now the other planes in your flight – were any of those ever damaged or lost?

Mr. Spielberg: A number of them were shot down. As I told you earlier, we came over late in the war. We were flying missions up until the end of the war, August 14th on Tinian, August 15th in the States. By that time, there were very few fighter...

Mr. Misenhimer: This is Side 2 of Tape #1.

Mr. Spielberg: In the missions that we flew, we never saw a single enemy aircraft. I mentioned earlier that they were being held in readiness for the invasion. The major losses that our Bomb Squadron sustained in those last two months of the war were primarily due to occasional anti-aircraft fire, but more likely either malfunction, such as an engine failure, or running out of fuel and having to ditch or having to land at Iwo Jima. Fortunately for us, Iwo was in American hands, and the airplanes could be repaired before they flew on back to Tinian.

Mr. Misenhimer: Did you ever have to make an emergency landing at Iwo?

Mr. Spielberg: On one mission. We were coming back after a night incendiary raid and I noticed that we could hardly hold up speed. I had to keep inching the throttles forward to give it a little more power, which was using more gas than I predicted we should have. I finally said to the pilot, "I think we ought to make the landing at Iwo because at the rate we are having to use fuel we won't make it to Tinian." So we landed there, and the ground crew there checked the engine. It turned out that they had to remove and replace three engines. Three of them had bad cylinders, the pistons in the cylinders were so loose that the engine couldn't hold compression. We couldn't draw the power that the engine is normally expected to give. That was the one case where we had to make a landing at Iwo. It was not an emergency landing because the runway at Iwo was long enough to handle the B-29's. It was a conventional landing.

There was one other flight where we lost an engine right over the target. This was another nighttime incendiary raid. About five minutes before we started our bomb run the gunners reported flames and sparks coming out of the left inboard engine. Capt Johnny Combs asked me if I could see anything wrong on the instruments. I looked and it took 15 seconds or so before I noticed that we were losing oil pressure on the #2 engine. That is the left inboard engine. He said, "What do you think we should do?" I said, "Well, I think that we should feather the propeller and shut down the engine. If you lose all of your hydraulic pressure there is nothing to govern the propeller, the blades would go to flat pitch and the propeller will spin up and run away. That could tear the propeller away from the engine and off its mount. Captain Combs said, "Look, let's follow it. We are just a minute or so away from dropping the bombs, let's see if we can keep four propellers running until we drop the bombs and get out of here." So we tried that. We went through the bombing run, dropped the bombs. You know, when you lose 10,000-11,000 pounds the airplane rises up. That change in the altitude of the airplane due to the sudden rising caused the propeller to run away. I could see the RPM, normally at about 2200, zipping up to 2500-3000-3500, approaching 4,000, and the noise was deafening. The pilot reached to feather the engine and the co-pilot reached to feather the engine, and between them they feathered two engines, the bad one and the #1, the outboard. So there we are, leaving the target, dropping precipitously with only power on two engines. Well, we got out of it OK. I was very busy. I had to shut down the bad engine, so it would stop windmilling and stop using fuel. Then I wanted to start the other engine. Well, we successfully air started it, and pretty soon we had three engines up and running and we were pulling away. By the way, once the ground search light observers see that an airplane has lost one engine, with the propeller not turning, they concentrate all the flak and all the search lights on that one plane. We got through it OK.

Then my real job came – transferring all of the fuel that was left in that #2 engine's fuel tank to the other three engines so that we could utilize all the fuel in the #2 tank. Then, getting the right power settings for maximum range to get back to Tinian. As we approached Iwo Jima, the aircraft commander asked me, "Can we make it, or should we land?" I said, "Sir, I believe we can make it." He said, "Are you sure?" I said, "Yes." So we continued on and we come to what the navigator says is the "point of no return." Either you return to Iwo or you continue on to Tinian. Once again, Johnny Combs asked me, "Can me make it?" I said, "Yes". Well, we made it! When we got down I measured the fuel remaining for those three engines and we had about 20-25 minutes of flying time. So, it was close, but we got back OK. That I guess was one of the most severe experiences we had in all of our flights.

Mr. Misenhimer: About how many flying hours from Iwo to Tinian.

Mr. Spielberg: That is about 3 ½ hours.

Mr. Misenhimer: Of course three engines were going slower than normal.

Mr. Spielberg: Yes, that's right. A typical round-trip to Japan and back was 14-14 ½ hours. A typical flight from Tinian to Iwo, Iwo to Korea, and then back to Tinian was 18-19 hours.

Mr. Misenhimer: There on Tinian what did you live in?

Mr. Spielberg: As an enlisted man we lived, two enlisted crews, to a large hut. It was more like a shed. It had wooden sides, and I think it had a wood roof, I'm not sure. There were 12 Army cots in there and two 6-man enlisted crews occupied it. Officers lived in Quonset Huts. There would be 20-25 beds to a Quonset Hut.

Mr. Misenhimer: How was the food there on Tinian?

Mr. Spielberg: I remember it as being OK. The Enlisted Men's Club didn't have a refrigerator, so you had your choice of drinking warm Coke or warm beer. Of the two, warm beer tasted better. Subsequently we got more of the amenities. We didn't have anylaundry service. Some of us tried to build the windmill type washing machine where you use wind power to turn a vane and chug a paddle up and down in a huge, washed out oil drum, filled with soapy water. Mostly you just took an old bomb crate, mounted it on wooden legs and then used a scrub brush, bucket and soap. You soaked your clothes and washed them out that way. We had a theater, which showed movies about four times a week, I believe.

Mr. Misenhimer: Did you ever have a USO Show on Tinian?

Mr. Spielberg: Not that I saw. I only saw movies at our theater.

Mr. Misenhimer: On August 6th, when they dropped the first Atomic Bomb on Hiroshima, how did you hear about that?

Mr. Spielberg: I think that on August 5th we had run a mission. It was the day before the A-bomb. Typically you ran a mission and then you had two days off, and then you ran another mission. The first day off you are supposed to rest, but the second day you go down to the flightline and make sure your airplane is ready for your next mission. Then on the third day, on about August 8th, you were ready for the next mission. Well, that morning of August 6th, we heard about it. As I said earlier, I was thinking, "Why did we have to do that when we were already winning?"

Mr. Misenhimer: Did you know what an Atomic Bombs was?

Mr. Spielberg: No, I had never heard of it, but I had a vague idea. I had studied physics in college and I had a vague idea about the atomic principle and uranium. I didn't know anything about fissioning uranium. I had never heard of the word Plutonium.

Mr. Misenhimer: When Japan surrendered, did you have much of a celebration?

Mr. Spielberg: Well, let me tell you about our last mission of the war. It was on the night of August 14th. It was another aerial mining mission to Maizures Harbor, Japan. We were told that the Japanese were expected to surrender any minute. After we took off and were airborne to Japan, we might receive a signal, either from a ship at sea or from Iwo Jima. That signal, whatever the code was, would tell us to dump our load of mines in the ocean, turn around and come home. If we had not heard it by the time we approached the target, continue with the mission. We never heard the signal, we continued with the mission, laid our mines across Maizures Harbor. There is a little story connected with that, but that is secondary. We came all the way back to Tinian. When we got back we were greeted by the Chaplain and the Group Commander. We all went to have breakfast and went to bed; we had been up all night. We were awakened about 10 o'clock that morning by shooting, shouting; everybody was firing their 45's. We had been issued 45's. Pretty soon the MP's came through and collected everybody's sidearms. We learned then that the war was over, and that the Japanese had accepted the terms of surrender.

The story I was going to tell you about is this. We were approaching the harbor, and it was totally cloud covered, so the bombardier couldn't use his bomb sight. So the radar officer had taken over the bomb run using his radar. As we entered the target the line across the harbor, he said, "Drop one." I think we were carrying six 2,000 pound mines. In any event, what normally happens is that the radio man in the front compartment or the command gunner in the rear compartment looks through the window in the door to the bomb bay compartment and says, "Number one is dropped sir," or something like that. Well, no word came from either radio or command gunner. Meanwhile, our radar officer said, "Drop number two." The aircraft commander gets on the intercom and says, "Radar, radio, gunner, is anything going out?" They said that nothing was coming out of the rear bomb bay, nothing was falling out of the front bomb bay. Meanwhile we are half way across the harbor and all of a sudden somebody, I think it may have been out Radar Officer, yelled, "Salvo these SOB's." Someone, I guess it was the Bombardier, hit the salvo switch and the mines landed in a cluster in one part of the harbor, and we got out of there. So much for our pinpoint mining. At least we dropped them on the target area.

Mr. Misenhimer: What would you have considered your most frightening time over there?

Mr. Spielberg: I think that my most frightening time was when we accidentally feathered two engines.

Mr. Misenhimer: Yes. How come the co-pilot, or the pilot, feathered the wrong engine?

Mr. Spielberg: You see, the four feathering buttons, one for each engine, are on the central panel between the airplane commander and the pilot. I don't know exactly what happened when they were reaching for the buttons. Both buttons on the left were pushed and two engines were feathered. It was fortunate that the bad engine was feathered before it really wound up to the point of throwing the propeller blade. Why is that important for me personally? Because the flight engineer's seat is right in the plane of the propellers.

Mr. Misenhimer: OK.

Mr. Spielberg: So if they would go through the fuselage they would go right by my head.

Mr. Misenhimer: What medals or ribbons did you receive?

Mr. Spielberg: We got an Air Medal after completing five missions. Our Bomb Group was given two separate Presidential Unit Citations with Oak Leaf Clusters for various campaigns we participated in. Only those other than a Good Conduct Medal, and Theater Ribbons.

Mr. Misenhimer: Did you come home with any souvenirs?

Mr. Spielberg: One souvenir that I saved is the emblem of our Bomb Squadron, the 421st Bomb Squadron. It is a picture of a huge gorilla holding a bomb, poised to hurl it on Japan. That was on a leather patch that you were supposed to sew on your flight jacket. I never sewed it on, and I believe that I still have it. I have one other souvenir that I prize very highly. When we were flying mining missions to Korea, there was always the possibility that if you were disabled, you might have to land in China, or some place in Southeast Asia. I believe the airplane commander was furnished with $100 in gold pieces to buy

our way to safety, if necessary. Every crew member was furnished with a nylon banner, about 9" x 12", which was written in five or six different languages, and the message was essentially as follows: I am an American aviator. My airplane has been disabled. My government is an enemy of the Japanese. If you will help me my Government will reward you. Or words to that effect. It was in French, Japanese, Chinese, Korean, Thai Language, and in the language that was spoken in Viet Nam, Laos and Cambodia (French Indochina). It has a big American flag at the top of it. So I have it framed on the wall in my home.

Mr. Misenhimer: How long were you overseas total?

Mr. Spielberg: About 13 months.

Mr. Misenhimer: When you got home, did you have any trouble adjusting to civilian life?

Mr. Spielberg: Not really. I took about two weeks of vacation, and then went back to work at Wright Field. It turns out that my Father had died while I was overseas. My Mother was all alone. My older brother, Arnold, who you may have met, was already enrolled in college. He was married and had a child. My younger sister was still in college and I was the only support for my Mother, so I had to go back to work immediately.

Mr. Misenhimer: Anything else you recall?

Mr. Spielberg: On our one daylight bombing mission, this was to, I believe, the Aichi Aircraft Company in Nagoya. Our bomb squadron, all squadrons of the 504th Bomb Group, were to rendezvous at some point about 50-75 miles off the shore of Japan. Our navigator had the coordinates, and he was supposed to get us to that point. We were supposed to rendezvous, then get in formation, and go in formation over the target. Well, as we approached that point, we saw hundreds of airplanes, with all different designations. These were not only groups from our Bomb Wing, but different wings, one from Saipan, another one from Tinian, one from Guam, planes with every designation, all flying around trying to locate their own groups. We would see a group rendezvousing up ahead so Johnny Combs, our commander, put the throttles forward to try to speed up and get close to them. In the meantime, I'm busy writing down that we were at such and such a manifold pressure, such and such rpm. I was trying to log our usage of fuel, and in the meantime we can't find our group. So when I say, "Capt we are going to use too much fuel trying to find our own group." We joined the nearest formation since we were all going to the same target. We dropped our bombs with them. We trusted the leader of that formation to have found the right target. By the time that we dropped our bombs we saw smoke rising up from the ground.

Mr. Misenhimer: On September 2nd, when they had the ceremony on the Missouri. Were you part of that fly-over?

Mr. Spielberg: The only one of our crew who was asked to fly there was Johnny Combs, our aircraft commander. I wish I had gone.

Mr. Misenhimer: Did you fly the same plane every day, or a different plane?

Mr. Spielberg: No, we flew one plane about three or four missions, and then we had different planes. When we came over to Tinian we brought a new airplane. Once we arrived on Tinian it was assigned to one of the older, more experienced crews, and we had a different airplane of a crew that wasn't going to fly then. We never did have our own plane. This is a problem for the flight engineer. If you do all your flying in the same airplane, you get to have a better feel for how accurate those cruise control charts are. You can depend on them much more carefully.

Mr. Misenhimer: What were some of the names of the planes that you flew?

Mr. Spielberg: One was called "Omaha Two More Times." I can't remember too many of them. I have some photographs somewhere where I can see some of the names. There was one called "Nip Finale."

Mr. Misenhimer: Did you ever get a chance to meet LeMay?

Mr. Spielberg: No. In fact, I never met the Wing Commander. I got to know the Group Commander. He was with us when we moved to the Phillippines. As I was assigned to the group staff, when he called the staff together I was included.

Mr. Misenhimer: What did you think of LeMay?

Mr. Spielberg: He was an extremely bold man. He quickly realized that high altitude precision bombing was going to do no good in defeating Japan. Going in anywhere from 25,000-30,000 feet in formation, conquering the enormous winds, even with a supposedly accurate bombsight, no way could we do precision bombing effectively. So we suddenly switched tactics to low altitude, saturation fire-bombing. They were quite effective. I remember, when we took those two prisoner of war supply missions after the end of hostilities, after August 14-15, and before September 2nd, we had maybe 10-15 minutes of extra fuel time that I calculated we could go cruising around. We cruised over Tokyo, Osaka, Nagoya, and we even flew over Hiroshima. To tell the truth, from the air, they all looked the same. Totally burned out. Block after block with nothing maybe except a brick wall or a chimney standing. You couldn't tell the difference between Hiroshima and Tokyo, except when you realize that one airplane did it to Hiroshima and hundreds of fire bombing raids did it for Tokyo. The damage looked identical.

Mr. Misenhimer: You mentioned the high winds over there. I understand that is when the Jet Stream was first discovered.

Mr. Spielberg: It could be. I am not aware of that.

Mr. Misenhimer: I had read that somewhere; that is when they first encountered those high winds at the high altitudes there.

Mr. Spielberg: In fact we heard estimates that sometimes the winds were up over 150 miles per hour.

James H. Steele in 1985.

2013-11-21-nytimes-james-h-steele-pioneer-in-veterinary-public-health-dies-at-100-img-1.jpg

James H. Steele, a veterinarian whose pioneering efforts to prevent the spread of disease from animals to people led him to be called “the father of veterinary public health,” died on Nov. 10 in Houston. He was 100.

His death was announced by several organizations with which he had long affiliations, including the Centers for Disease Control and Prevention and the University of Texas School of Public Health.

The potential for a disease to pass from animals to people had been understood for millenniums, but it was not until the late 18th century, when Edward Jenner developed a vaccine for smallpox, that someone found a way to prevent it. The idea that government could take a systematic approach to fighting disease in animals to protect people did not take hold until the middle of the 20th century, when Dr. Steele led the way.

He helped establish mass vaccination and prevention programs in the United States for diseases like rabies and bovine brucellosis. After setting up federal programs, he helped start them at the state level. He visited dozens of countries to start veterinary public health programs and to help trace specific diseases, like Rift Valley fever in Nigeria, where he traveled in the 1970s. He constantly looked beyond his immediate field: in 1964, he published a paper titled “The Socioeconomic Responsibilities of Veterinary Medicine.”

He participated via Skype this summer at the annual conference of the American Veterinary Medical Association in Chicago during a lecture series, “The James Steele Challenge: A Better World Through One Health.” It focused on his lifelong passion: convincing people that economic prosperity was rooted in animal, human and environmental health. Scores of students cite him as their mentor.

“What would things be like if there had never been a Jim Steele?” said Dr. Craig N. Carter, a veterinarian who studied under Dr. Steele and later wrote a biography of him, recalling the questions he and several colleagues asked one another after a recent memorial service for Dr. Steele. “Would we be 30 or 40 years behind where we are now?”

In 1942, a year after Dr. Steele received his doctor of veterinary medicine degree from Michigan State University, he became one of the first veterinarians to receive a master’s degree in public health from Harvard. In 1945 he started the veterinary public health program at the United States Public Health Service in Washington. In 1947, he and the unit moved to Atlanta, to what is now called the Centers for Disease Control and Prevention.

Two years after that he went to work for the office of the surgeon general as chief veterinary officer. He became the nation’s first assistant surgeon general for veterinary affairs in 1968 and deputy assistant secretary for health and human services in 1970. The formal name for the types of diseases Dr. Steele dealt in, which pass from animals to humans, is zoonoses. While he had strong science and field experience — his interest in pursuing a veterinary degree increased after he helped investigate a brucellosis outbreak in a lab at Michigan State in the 1930s — his special talent was in finding practical ways to address disease on a large scale.

“He had to take all that science and translate it into a disease control program,” said Dr. Peter Cowen, who teaches epidemiology and public health in the college of veterinary medicine at North Carolina State University. “Jim took the science and protected public health.”

James Harlan Steele was born on April 3, 1913, in Chicago to James Hahn Steele and the former Lydia Norquist. He grew up, all the way to 6-foot-7, in Chicago, and stayed there into his 20s, selling insurance to help his family before he entered Michigan State.

In 1971, he became a professor at the University of Texas School of Public Health in Houston.

He retired in 1983. His survivors include his wife, Brigitte; his sons, Michael, James and David; and four grandchildren. His first wife, the former Aina Oberg, died in 1969.

Many veterinarians and public health officials credit Dr. Steele for a recent increase in attention to what is called “one health” or “one medicine.” They note that epidemiologists are now far more aware of humans’ vulnerability to animal diseases, in part because among the emerging diseases of the last two decades, including West Nile virus, mad cow disease and monkeypox, 70 percent are zoonoses, crossing from animals to people.

“This was something that just totally was not considered before Jim Steele,” Dr. Carter said. “His work has led to this progression toward integrated medicine.”

Dr. Steele wrote several books and received scores of awards, including the Medal of Merit from the World Animal Health Organization and the Surgeon General’s Medallion.

He was quick to credit his mentors and students, and he always put his accomplishments in context.

“The impact of veterinary research through the years has been startling,” he wrote in the 1960s. “It has opened vast areas of continents to animal husbandry, given a base to many industries and improved human nutrition beyond expectation. Probably in no other creative area has an investment returned so great a dividend for mankind.”

Myron G. Schultz : Author affiliation: Centers for Disease Control and Prevention, Atlanta, Georgia

James Steele, DVM, MPH, passed away on November 10, 2013, in Houston; he was 100 years old. Jim Steele (Figure) was an extraordinary man. All of the dimensions of his life were on a grand scale. He was larger than life in so many ways; his vision, his leadership, his accomplishments in public health, his worldwide friendships, his mentorship of scores of young acolytes who came within his orbit, his extraordinary memory, his bear hugs, and his longevity were all manifestations of his boundless enthusiasm for life.

Dr Steele's professional career spanned more than 70 years. It began in 1938 when he worked in a brucellosis testing laboratory for the Michigan State Department of Agriculture while studying veterinary medicine at Michigan State University. Brucellosis developed in many of his veterinary colleagues, and he wanted to learn how the causative pathogen and other pathogens were transmitted from animals to humans. This was the beginning of his lifelong vocation of studying and controlling zoonotic diseases.

In 1941, Dr Steele received a doctorate of veterinary medicine from Michigan State University, and in 1942, he earned a master of public health degree from Harvard University. In 1943, he was commissioned as a sanitarian in the Public Health Service (PHS). He spent most of World War II in Puerto Rico and the Virgin Islands, where he coordinated milk and food sanitation programs, evaluated zoonotic threats to the islands, and conducted research on brucellosis, bovine tuberculosis, rabies, and Venezuelan equine encephalitis.

After the war, Dr Steele's encounter with Assistant Surgeon General Joseph Mountin [https://en.wikipedia.org/wiki/Joseph_Walter_Mountin], the legendary founder of the Communicable Disease Center (now named Centers for Disease Control and Prevention; CDC), changed his career. Dr Steele was fond of telling how Dr Mountin challenged him by asking, "What are you veterinarians going to do now that the war is over?" In response, Dr Steele described some of the known zoonotic diseases, and Dr Mountin asked questions about their prevalence and control. Dr Steele's main response was "We don't have any data, nor do we know how to control these zoonoses." In the end, Dr Mountin said, "Steele, it is quite apparent that we have a problem and a lot of ignorance—let us exploit it!" Thus, in 1945, Dr Steele produced a detailed report titled Veterinary Public Health, which outlined the risks posed by zoonotic diseases and the benefits of employing veterinarians for research and response efforts. Dr Mountin and Surgeon General Thomas Parran were impressed by the scope of the report, and in 1947, Dr Steele convinced the Surgeon General to establish a Veterinary Medical Officer category in the PHS. He entered this service category and became the PHS chief veterinary officer. When he retired from the PHS Commissioned Corps in 1971, Dr Steele was an Assistant Surgeon General, the first veterinarian to achieve this rank.

Dr Steele came to CDC in 1947, just after its beginning. There was no road map for the work he did—he was a pioneer, creating CDC's veterinary public health program. Much of his work was focused on rabies eradication. He and his team improved the existing vaccine, and he then worked toward eliminating the disease in dogs and cats in the United States and other countries. He also worked on other diseases that threatened humans and animals, including bovine tuberculosis and brucellosis, Q fever, psittacosis, salmonellosis and other food-borne diseases, and avian influenza.

Dr Steele also pioneered the integration of veterinary public health into the Pan American Health Organization (PAHO) and the World Health Organization (WHO). In 1950, he attended the first WHO Expert Committee meeting, and in 1965, he chaired the second meeting. These meetings brought together the most eminent experts in the world of zoonotic diseases and emphasized the need for international collaboration and common goals. Jim Steele worked closely with PAHO and WHO throughout his career.

Dr Steele enjoyed a good relationship with [Dr. Alexander Duncan Langmuir (born 1910)] , who founded CDC's Epidemic Intelligence Service (EIS) training program in 1951. In 1953, Dr Langmuir asked Dr Steele to recruit veterinarians to work in all epidemiologic areas (animal and nonanimal diseases) of the EIS program. This was the beginning of a new sphere of opportunity for veterinarians in public health. Today, veterinarians are integrated into all areas of PHS activity.

When he retired from PHS in 1971, Dr Steele became a professor at the University of Texas School of Public Health. He was an active teacher, writer, and mentor. He compiled the CRC Handbook Series in Zoonoses, the first comprehensive collection addressing diseases shared by humans and animals. The book remains a staple of public health curricula throughout the world.

Dr Steele received numerous awards during his career. Among them are the American Public Health Association's Bronfman Prize, the American Veterinary Medical Association's International Veterinary Congress Prize, the Surgeon General's Medallion, the PAHO Abraham Horwitz Award for Excellence in Leadership in Inter-American Health, the OIE (World Organization for Animal Health) Medal of Merit, and many more. In addition, the University of Texas School of Public Health holds an annual James Steele Lecture, and a James H. Steele Veterinary Public Health Award is given annually at CDC's EIS Conference.

The message of the One Health Initiative is that human health and animal health are inextricably linked: we cannot have good public health unless we have good animal health, and we cannot have good animal health unless we have good public health. Jim Steele was a father of the One Health Initiative. He didn't merely profess this concept—he practiced it for 7 decades, and he taught it to younger generations of veterinarians. Jim Steele had an extraordinary capacity for mentoring younger health professionals and sustaining lifelong relationships.

Lewis Thomas, the physician–philosopher who wrote about so many aspects of life, said that the highest state of life is to be useful—to be engaged in purposeful activity with your fellow men. By this measure, Jim Steele was a rich man—not in material wealth, which is ephemeral—but in his relationships with other human beings, which are enduring. Jim Steele has left a legacy in which millions of persons have been granted healthier lives. The world is a better place because Jim Steele lived and served humanity.

Marvin Leonard Stein (born 1924)

Wikipedia Marvin Stein (computer scientist)

Saved Wikipedia (Nov 13 2020) - Marvin Stein (computer scientist)

See [HK003S][GDrive]

Marvin Stein (1924-2015) was a mathematician and computer scientist, and the "father of computer science" at the University of Minnesota.[1]

Early life[edit]

Marvin Stein was born in Cleveland, Ohio in 1924 to Russian-Jewish immigrants. The family later moved to Los Angeles, California to treat Stein's mother's tuberculosis.[2] As an adult Stein entered University of California, Los Angeles in 1941. His studies were interrupted and in 1942 he served in the US Army Signal Corps as a tabulating machine operator, and had a short stint working at IBM. He returned to school after the war and graduated from UCLA in 1947.[3]

After earning his Ph.D. from the Institute for Numerical Analysis at UCLA (an ancestor of UCLA's computer science department), Stein was hired as a senior research engineer by aircraft manufacturer Convair in southern California. He primarily worked on missile simulations for the SM-65 Atlas,[3] on which he worked with a UNIVAC 1103. Though the 1103 been made for and used by the Armed Forces Security Agency under the name "Atlas 2" (unrelated to the missile of the same name), this was the first commercially sold 1103. Stein's work installing the UNIVAC 1103 with Erwin Tomash introduced him to the emerging computer-science scene in Minnesota in the 1950s.[4]

Stein lost his job with Convair when his security clearance was revoked by the House Un-American Activities Committee on account of Stein's Jewish heritage. It was later re-instated, but Stein had already decided to move on.[2]

University of Minnesota[edit]

In 1955, Remington Rand, manufacturer of the UNIVAC computers, heard that the University of Minnesota was considering purchasing a machine from one of Rand's rivals: an IBM 650. Rand offered to simply give the university 400 free hours on a UNIVAC 1103 on the condition that they hire a dedicated faculty member to oversee its operations. Stein was hired in the IT Mathematics department in the University of Minnesota to fulfill this condition, and he assumed stewardship of the UNIVAC.[5] The UNIVAC 1103 was around 60 feet long, 30 feet wide, and weighed over 17 tons.[1]

Stein taught the first University of Minnesota courses on high-speed computation and played a singular role in developing the university's path to computer science education. In 1958, Stein was made the head of the university's Numerical Analysis Center at the Institute of Technology (later the University Computer Center), for which the university purchased its own 1103 at a discounted price of $250,000. The center was also home to a Reac 100.[4] Stein maintained a computer archives system for decades, over three significantly different generations of machine.[6]

In 1967, Stein created - with William Munro, Neal Amundson, and Hans Weinberger - the university's graduate program in Computer and Information Sciences. Three years later, in 1970, the university established a formal Computer Science department.[4] Stein resigned as head of the Computer Center and became the first head of this new Computer Science department.[7] He stepped down the following year, and served as a professor in the department until his retirement in 1997.[1]

Stein received a Guggenheim fellowship in 1963-1964 for his work with Magnus Hestenes on the conjugate gradient method and for being the principal inventor of the Pope-Stein division algorithm and the Stein-Rose sorting algorithm.[1] He served as a visiting professor of computer science at Weizmann Institute of Science in Rehovot, Israel from 1963-1964 and at Tel Aviv University and Hebrew University of Jerusalem from 1971 to 1972.[2]

Stein died in 2015. His papers are held in the University of Minnesota Archives.[2]

Publications[edit]

In 1964, Stein wrote *Computer Programming: A Mixed Language Approach* with contributor William Munro for Academic Press.[8] It was well reviewed in its time,[9] and in 2017, more than five decades after its publication, it was still in print in its third edition.[10] It was written with the intention to provide instruction in assembly language programming to both professional programmers and highly technical laypersons. Much of the book was originally designed around the CDC 1604 and the Fortran language.[11]

2015 (march 04) - Star Tribune, Minneapolis and St. Paul - Marvin L. Stein

See [HN01BK][GDrive] (Note - Middle name is identified here - "Leonard")

Stein, Marvin Leonard Died peacefully on February 27, at the age of 90. Marvin was born on July 15, 1924 in Cleveland, Ohio to Russian-Jewish immigrants, Carl Stein and Marion Marks. When Marvin was three, his mother contracted tuberculosis. Marvin, his parents and older brother Harvey, moved to Los Angeles for her treatment and remained there after her death. Marvin grew up in the Boyle Heights area of L.A., which was known for its eclectic mix of people. He graduated from Roosevelt High School in 1941. Marvin continued his education at UCLA, but left to serve in the United States Army during WW II. While at Roosevelt, Marvin met Ruth Meyerson, who car pooled with him to UCLA. Marvin and Ruth married on July 15, 1944, his twentieth birthday. They celebrated their 70th wedding anniversary last summer. After World War II, Marvin resumed his education at UCLA, earning a Ph.D. in Mathematics in 1951. After working at UCLA Mathematics Institute of Numerical Analysis (1948-1952), Marvin became a research engineer at Convair in San Diego, California, working on the development of the Atlas missile. It was the height of the McCarthy Era and Marvin's security clearance was revoked because he was Jewish. By the time the action was overturned by the court, Marvin was ready for a change. In 1956, Marvin accepted a position as Assistant Professor at the University of Minnesota, where he was promoted in full professor in 1961. Although he spent his entire academic teaching career at the U of M, he was also a visiting professor at the Weizmann Institute of Science (1963-1964) and the Tel Aviv and Hebrew Universities (1971-1972). Through his life and work in Israel, he established a close connection to that country, personally and professionally, that would last to the end of his life. Marvin is affectionately referred to as "the father of Computer Science at the University of Minnesota." Some in the 1950s doubted that machines could be used to solve complex problems, while others didn't think that working on machines to solve problems was a good idea. Marvin begged to differ, understanding the need for development of computers and the impact computers could have on our society. He became director of the Numerical Analysis Center, taught the University's first courses in high-speed computation and created with others the first graduate program in Computer and Information Sciences in 1967. In 1970 he served as founding Department Head for Computer Sciences. He had an important role in the discovery of the conjugate gradient method and he was the principal inventor of the Stein-Pope division method and the Stein-Rose sorting algorithm. His children fondly remember their dad making his huge flashing computers punch out cards shaped like Mickey Mouse and, years later nodding sagely while they showed him their iPads. Marvin continued as a professor until his retirement in 1997. The Marvin L. Stein papers are held in the University of Minnesota Archives. Marvin was at his happiest when he was with Ruth, their children, and grandchildren, dancing to Benny Goodman records, walking through Prospect Park in Minneapolis, or along the beach in San Diego. Marvin was preceded in death by his parents, his brother Harvey Stein, his sister Jacqueline Yahr, and his beloved son, Eugene Harvey Stein. He is survived by his wife of 70 years, Ruth Meyerson Stein, his brother Steve Stein of Los Angeles, his children Tamar Stein (Abram Edelson) of Los Angeles and Jerry Stein (Margy Braden Stein) of Minneapolis, his daughter-in-law Sandi Stein of Minneapolis, and his adored grandchildren Jennifer Edelson (Greg Wagner), Libby Edelson, Jordan Stein (Carrie Walker Stein), Nat Bennett (Sharon Stanley), Sarah Stein (Rob Vork), Ben Braden Stein, great-grandchildren Elijah and Gabriel Wagner, Sefirah, Aryeh and Zvi Stein, Max Vork and Saul Stanley-Bennett, as well as nephew Paul Stein of Miami, and many dear family members in southern California.

7 November 1984 - Interview - Charles Babbage Institute - Center for the History of Information Processing - Marvin Stein Interview

Conducted by William Aspray

[HI001K][GDrive]

Abstract

In the first session of the interview, Stein discusses his early career and the formation of the University of Minnesota's computing facilities. After learning basic digital and analog operation during World War II, he obtained a doctorate in mathematics from UCLA. While teaching numerical analysis at UCLA, he also worked on missile simulation at Convair, Inc., in San Diego. After becoming familiar with the ERA 1103 computer Convair purchased from Engineering Research Associates, Stein made frequent consultant visits to ERA headquarters in Minnesota. In 1955, the University of Minnesota hired Stein to introduce their first computer courses and administer ERA's gift of free computer time. He describes early computer applications to crystallography and low-energy electron scattering, and the policy he established for the computer center to make users self-sufficient programmers. Stein reviews the growth of the Computer Center: the acquisition of an ERA 1103 computer with National Science Foundation support, the construction and use of a hybrid computer out of the 1103 and a Reeves Electronic Analog Computer (REAC), and the purchase in 1960 of Control Data 1604 and 1700 computers.

In the second session, Stein discusses the formation of Minnesota's program in computer science. He explains the rationale for his 1966 proposal for a graduate program in computer science and for the move in 1969 to a department of computer science independent from mathematics and electrical engineering. Stein reviews the curriculum that was intended to introduce students to a wide variety of applications so that they could introduce computer science into other disciplines. Stein discusses the difficulties in hiring enough qualified faculty members, the relations between the computer center and the computer science department, and the state's attempt to bring all educational computing under the control of the Minnesota Educational Computer Consortium.

ASPRAY: Professor Stein, I thought that we'd start the session today by talking about Minnesota in the period prior to your coming to the University. I would like to try to get some background as to the kinds of mechanized computing activities there were at the University then. Why don't I let you just begin some place and I'll stop you at one point.

STEIN: As far as I know, there were two foci of computing in the University. Of course, the business office did the routine kinds of computing that were being done in those days, usually with IBM tabulating equipment. The School of Business had some kind of a computer center, and the Institute of Technology and some of the departments in engineering, physical sciences, and mathematics did some computing. I believe that the School of Business had an organized activity. Apparently they had some IBM statistical sorters and things like that. I'm not totally familiar with what they did.

ASPRAY: Were their users only people in the business school, or were the facilities more generally available to University researchers?

STEIN: I believe that they were open to all University researchers. Fees were charged for the services provided. There was a professional staff that operated that equipment.

ASPRAY: As far as you know, was there any subsidy from the business school or the University general administration for these fees? Or did the fees really cover the costs?

STEIN: I think the fees actually covered the costs. As I said, some of the departments did computing. In those days, there were two mathematics departments: one was in the Institute of Technology and the other was in the College of Science, Literature and the Arts, as it was then known. The IT mathematics department had a laboratory equipped with hand calculating machines, which were used in a course in numerical analysis for engineers.

ASPRAY: You say hand calculating machines. What sorts of machines do you have in mind?

STEIN: I mean just mechanical calculators.

ASPRAY: Marchants?

STEIN: Marchants, Monroes, and the machines of that ilk. The Institute of Technology had something that you could call a computer center. It was run by two graduate students who were employed as research fellows. One of them is now a professor in electrical engineering.

ASPRAY: Who is that?

STEIN: That's James Holte. This organization had some of the most antiquated IBM tabulating equipment I've ever seen, and I've seen a lot of it.

ASPRAY: Punched card equipment?

STEIN: Yes. Before coming to the University, during my army service during World War II, I functioned as a tabulating machine operator, and later I spent a short period working for IBM. The equipment that IT had, even for those days, was museum equipment. But they did have something interesting, and that was a Reeves Electronic Analog Computer.

ASPRAY: The REAC?

STEIN: Yes. They were very proud of it. I'm not sure where the money came from; some of it probably came from local industry. My guess is that they spent about fifty thousand dollars for the equipment. That was a pretty good piece of money in those days.

ASPRAY: What year would this have been?

STEIN: I think that they acquired it in the early 1950s. Possibly in 1949.

ASPRAY: About that time.

STEIN: You might find the date in one of the files. I turned over the Reeves file, which I inherited.

ASPRAY: Yes, I think there is some information, though I don't recall the date.

STEIN: That machine was still state of the art, even when I arrived. It was being used for a number of research activities in the University, and also by local industry.

ASPRAY: Can you give me some examples of the University's uses of the machine?

STEIN: You realize you're making me think back thirty years. I don't know that anybody's memory is that good. But, as I recall, one of the people who was quite interested in that machine was Russ Amundson, who now has a building on campus named after him. He was head of chemical engineering in those days. He was quite interested in systems of differential equations that were associated with various kinds of chemical factories. I don't know if these were reactors; probably not. They were more likely processes used in refining oil and things like that. As I recall, the person who was helping him in this work, and probably had his hands on it the most, was Gus Aris. Subsequently, they both became Regents' Professors. Of course, Honeywell Aeronautical used this equipment extensively for missile simulation, and simulation of other kinds of vehicles. I would think that people in aeronautical engineering made use of it.

ASPRAY: Do you know what financial arrangements were between industry and the University for the use of

REAC?

STEIN: There was an hourly charge made. I don't remember what it was; but for those days the budget had a significant surplus. Somehow the surplus didn't come along when I took over that lab.

ASPRAY: That is to say that the charges that were placed against users were more than sufficient to cover the costs of the equipment and the personnel at the time, so that it was a money making operation?

STEIN: Well, at least it didn't lose money. It may very well be that when I noticed the surplus, the normal charges -- cross charges for the salaries of personnel -- had not actually been applied to the budget.

ASPRAY: Were there University users of the REAC other than from the science and engineering departments? Economists, for example? Psychologists?

STEIN: I don't remember. I think that in the files that I turned over there's a report on REAC usage for the year 1955 or 1956, which would have been typical

for previous years. There may even be a complete list of problems undertaken on the REAC.

ASPRAY: I didn't find that. But it may still be in the files; I didn't get through them entirely.

STEIN: Certainly I remember compiling that report, and it ought to be in the files somewhere.

ASPRAY: My guess would be that the REAC didn't get much use from psychologists and economists, except in very narrow ranges, because it was an analog machine and mostly suitable for differential equations. Is that correct?

STEIN: Well, no. It's correct that it's mostly suitable for differential equations. You could also adapt it for the solution of systems of linear algebraic equations. The University of Minnesota has a group of economists who are remarkably good at mathematics, and it did in those days too.

ASPRAY: I see.

STEIN: It's possible that there were some economists using it. I don't know what interest there was in man-machine interactions among the psychologists. But a machine like the REAC might have presented them some opportunities in that area, although I'm not aware that they were actually interested.

ASPRAY: What were the weaknesses of the REAC?

STEIN: One is that it's very difficult to program. The so-called set up time poses a problem.

ASPRAY: Could you explain that procedure to me?

STEIN: Essentially, the REAC is a collection of electronic elements that function in parallel. To solve a problem, such as finding a solution to a system of differential equations, one has to wire those elements together in the appropriate order. There is a plugboard for that purpose. One had to put a considerable number of wires into the right holes on a rather complicated looking board. There were also dials on which various constants could be set and introduced into the system. One had essentially to draw the wiring diagram corresponding to the problem, and then actually set the machine up in accordance with this diagram. That could take a considerable amount of time. There was also a scaling problem involved. I don't want to launch into a lecture, so I'll just say that it's much more difficult than scaling in digital computation, most of which is handled by floating-point arithmetic. Analog computers don't have floating point arithmetic for that purpose. Probably the most significant difficulty was the error. Analog systems are very limited in their accuracy, even in the problems that they're suited for, which are a limited class of problems.

ASPRAY: Can you quantify what the typical amount of time that it took to set up a problem was, and what the typical error would be?

STEIN: I don't recall that I have ever personally undertaken a problem on the REAC, or on any other analog computer. But I have given some thought to analog computers and the relationships between analog and digital computation. I'd say that for a system of about ten differential equations, which might have been the outer limit of the machine that they had here, it might take a couple of weeks of tinkering around to get set up. There were also considerable doubts as to when a problem was checked out -- that is, as to whether the set-up actually reflected the mathematical equations, because people who used these machines generally did not speak of integrating and differentiating, but in more physical terms. They talked about low-pass and high-pass filters, and so on. That was another problem. Sometimes the mathematics wasn't even known. The engineers were satisfied that they had the analog of the physical system. My guess is that one was lucky to get two or three digits of accuracy.

ASPRAY: The MIT people claimed that they typically got three digits of accuracy on the Rockefeller Differential Analyzer.

STEIN: That sounds about right. In any event, that was the state of computing before I got here.

ASPRAY: Given all the limitations of the REAC, do you think it provided good service to the University?

STEIN: Yes. It was the best thing they could get at that time. There were talented people at the University and in industry who knew how to use that equipment properly, within its limitations. Consequently, it was well worth it. They got good results from it.

ASPRAY: Were there close ties between the computing activities in the business school and the ones in IT?

STEIN: I don't think there were any ties at all until I arrived.

ASPRAY: Let's turn now to the series of decisions at the University that resulted in bringing you to the campus. Who were the people involved? Could you tell the story?

STEIN: Back in the REAC days, in 1950 or 1951, there had been some serious thought given to establishing an Institute of Technology computer center on a more solid basis. They were planning to hire a faculty member with the rank of instructor. In those days, they sometimes used the instructor rank for regular faculty positions. A person whom I had worked with and knew socially as a graduate student was head of the mathematics department here. That's Stefan Warschauski. He called me and asked if I had an interest in that position. I said that I did, but he later informed me of some internal politics, of which I certainly don't know the details, the result of which was that the people involved had left by the time I actually came here in 1955. I believe that two engineering departments couldn't agree as to the organization and control of this center, so it never came to be.

ASPRAY: Were some of the people who were involved in this first attempt in 1951 later involved in the more formal arrangements?

STEIN: Yes. There was Professor Henry Hartig, who was head of electrical engineering when I came here, and Gerry Shepherd, who is now retired Academic Vice President, succeeded Hartig as head of Electrical Engineering, and was Associate Dean of IT when I arrived. Shepherd was involved in both attempts, I'm sure. He probably had a significant interest in anything of that nature. Hartig was mo re or less in control of the REAC and the tabulating equipment. At least that was my understanding, since when I took over I received all the budget and correspondence files from him. There was a realization at the University that something more had to be done, that their digital computing facilities were inadequate. I believe that somewhere in the central administration somebody had decided to order an IBM 650, which had a serial kind of drum. The significant thing that happened was that a group in St. Paul, Engineering Research Associates (which by that time had been taken over by Remington Rand, and probably were beginning to be referred to as UNIVAC), were building a machine called the Engineering Research Associates 1103. It was later renamed the UNIVAC Scientific Computer. Arnie Cohen, former Assistant Dean of IT, was one of the principle architects of that machine. Seymour Cray was also heavily involved in it. In any event, a gentleman from UNIVAC named Byron Smith, in cooperation with Arnold Cohen, offered the University of Minnesota four hundred hours of use of this machine.

ASPRAY: Free usage?

STEIN: Free usage. The University then wanted a faculty member to take charge of this gift, and also to introduce to the University some courses in modern

computing machinery. These were to address, essentially, what we do with these things. They also wanted a course that viewed them as objects of intrinsic interest.

ASPRAY: Not only the service aspect, but also the science of computing.

STEIN: That's right. This was the work of a study committee of distinguished faculty members appointed by President Morrill. I'm sure that that report has to be in the archives somewhere, and would make interesting reading. It addresses itself to computing at the University of Minnesota.

ASPRAY: Is this the report that had many sections, of which the subject of computing was one?

STEIN: Yes. I think it was an outstanding piece of work.

STEIN: It recommended that in order to make the best use of UNIVAC's gift, some new people should be brought in. As it happened, through the good offices of a person well known to the Babbage Institute, Mr. Erwin Tomash, I was involved in some consulting work for Engineering Research Associates. If my memory serves me right, Mr. Tomash himself was involved in the design of the 1103. He may at that time have been the national sales manager for UNIVAC. He introduced me to Byron Smith. Since I was consulting, I was coming to St. Paul regularly. As I mentioned, I was also well acquainted with Stefan Warschauski, the head of the Mathematics Department in the Institute of Technology. He asked me on one of my visits if I had any interest in the position. I had an interest in it. On a Friday afternoon I paid my visit to the IT Dean's office and spoke with Gerry Shepherd, and on Monday I had an offer. Things could really move quite quickly back in those days. This was in the summer of 1955.

ASPRAY: And you took the position?

STEIN: I accepted the position, and I've been on the faculty here since September 1955.

ASPRAY: Before I ask you any more details about your own background, let me come back to something for a moment. Did the gift of time on the 1103 preempt the purchase of the IBM 650?

STEIN: It did. That was one of the first things I took care of when I arrived, because my feeling was that all that we would do by acquiring an IBM 650 would be to saddle ourselves with the need for another one almost immediately. The machine didn't have the capacity to do anything significant in the university.

ASPRAY: At that time, was the 701 available from IBM?

STEIN: Yes, the 701 and the 1103 were the two machines for so-called "scientific computation" in those days.

ASPRAY: What inclined you towards the 1103? Was it the fact of the gift?

STEIN: No, the 1103 was clearly a superior machine in every respect. I don't want to pursue a detailed analysis of my reasons, but it was simply a better machine in terms of its computing capacities. In terms of the software available, which people didn't think much about in those days, it probably was inferior; but that's not the fault of the machine.

ASPRAY: Why don't we go back and briefly discuss your background? What was your career like prior to your coming to the University?

STEIN: I was raised in Los Angeles, and entered UCLA in 1941. I was interested in studying philosophy in those days. It just so happened for some reason that I began to be interested in the philosophy of science and mathematics. It may have been because of the visit of Bertrand Russell to the campus the year before my entrance. I was still a high school boy when he came, but, nevertheless, I was quite excited by his visit. That was the kind of philosophy that I wanted to study. I soon discovered that one really ought to know a lot more about mathematics and science before attempting to philosophize. I was a little appalled at my fellow students, most of whom were a lot older than I. They were all very glib about it, but they didn't seem to know much. They had a lot of gall. I switched to physics. In trying to understand the Michelson-Morley experiment, I soon discovered that one didn't really study physics the way that I wanted to without knowing mathematics. So I ended up as a mathematics student. But my studies were interrupted by the war and I was enlisted in the army at the end of 1942. For some reason I was assigned to the Signal Corps. The Signal Corps wanted to computerize the operations of its signal depots, which meant essentially that they wanted an accounting procedure to keep track of their stock. They were looking for people who had some kind of mathematical training, and my card must have fallen out of the hopper. I was assigned to the L.A. Signal Depot and actually sent to the local IBM office. I was only a private first class. I think the commanding officer sent me to the local IBM office to learn how to become a key-punch operator. Fortunately for me, while my key-punching courses were going on, IBM was offering a course for installation managers, a refresher course. I asked the people if I could sit in on this course. I seemed to have found something that interested me, because by the end of the first week I was helping the instructor teach it. When I returned to the signal depot, it turned out that all of the higher ranking noncoms who had been sent to IBM World Headquarters had not learned all that they had been expected to learn there. And being a brash young man I said, "Listen, Colonel, I know how to do all this stuff." Since he was not really a colonel, but had been the manager of a large business and a reserve officer, he didn't believe in ranks, and he said, "All right, Stein, if you can do this, you're in charge." So I took over that installation. At the end of the war in Europe, I went off on a special project which was working with the officers who were planning the invasion of Japan, at least the Signal Corps' part of the invasion. They wanted to know what equipment was available and what days it would be loaded onto various boats, what days it would arrive at the battlefields, and things like that. My job was to come in at night when everybody had left, balance the files, and then program the answers to the questions that were being sent to me by the planning officers. They sent them to me by teletype. I never saw any of those officers personally. So that meant programming, really: wiring boards and planning the passage of cards. I didn't realize it, but I suppose I was inventing what we call data-base analysis. I was too busy doing it to develop a theory for it. In those days I wasn't a very theoretical person. But I did learn something; I had the hands-on experience of operating equipment and doing computations. At the end of the war, I returned to UCLA and resumed my studies. I graduated in 1947 and became a teaching assistant. At that point, the National Bureau of Standards and the Regents of the University of California entered into an agreement to establish an Institute for Numerical Analysis on the campus of UCLA. Part of the agreement was that there would be some graduate research fellows appointed. I applied for one of these fellowships, and was in the first group of research fellows at the Institute for Numerical Analysis. At the same time, they were building a computing machine.

ASPRAY: This was SWAC?

STEIN: Yes, SWAC under Harry Huskey. I took quite an interest in that machine. In addition to that, there were programming classes for senior staff given by a very distinguished programmer. I don't know why my memory is failing me. She won the Gold Medal of the Department of Commerce for her contributions to programming. Under this distinguished lady (Ida Rhodes), I learned programming with a distinguished class of mathematicians such as Alexander Ostrowski. It turned out that I was the only member of the research staff who had had his hands on a computing machine. The only actual computing machine we had was a Card Programmed Calculator. The machine that was being built, the SWAC, wasn't ready. We were learning to program for it, but whenever we

had to try out an idea it went on the Card Programmed Calculator. I was the most junior member of the research staff, but the only member who had had hands-on experience with such equipment, so I was involved in trying out almost every new idea. I worked with Magnus Hestenes on a number of problems in the calculus of variations, numerical methods for solving these problems. He and I were also involved at that time in the development of the conjugate gradient method.

ASPRAY: That's something I'm not familiar with.

STEIN: That is a well known method of solving systems of linear equations, that Hestenes and Edward Stiefel have the credit for developing. I worked with Hestenes in the early stages of that. Some of our work was subsequently published in the Journal of Optimization Theory and Applications as an important historical contribution to numerical analysis.

After getting my Ph.D. and spending another year at the Institute as a member of the research staff, I found that there were not many academic jobs available because of the Korean War. UCLA was starting a graduate program leading to a certificate in numerical analysis. It was not an extension program, but it was handled administratively through the extension division. Since the appointment to the program didn't pay a living wage, they found me a job at Convair down in San Diego.

ASPRAY: What did you do there?

STEIN: At Convair, I was a senior research engineer. They were operating in the computing laboratories some Card Programmed Calculators, and I designed some of what we called 'boards' in those days. Those are the operating systems for doing extensive computations on the Card Programmed Calculator. Primarily, I worked on missile simulations, which were being done for the Atlas missile, our first ballistic missile. I had those missiles flying in orbits around the moon, long before Sputnik was ever heard of -- theoretically, of course.

ASPRAY: Of course.

STEIN: At that time, Convair decided to go for a real digital computer -- an internally programmed one, that is , since the CPC was certainly a real digital computer. Convair chose an 1103, which was installed by Erwin Tomash. That's when I became acquainted with Erwin. It became my job to get that machine installed and operating and to begin using it properly. It was through what I did at Convair that I made the acquaintance of people here in the Twin Cities.

16

ASPRAY: How would that be?

STEIN: The 1103 machine that we received at Convair was probably serial number two. Serial number one was probably at the National Security Agency.

ASPRAY: I see.

STEIN: The machine was very secret. In any event, it was a very early machine and it couldn't function very well without periodic visits from the people who had designed it. We had people like Jim Thornton come out to do maintenance on it. People who were sent out as representatives of Engineering Research Associates were very high level people. We had people like Claire Miller and Abraham Franck. Because of this I was acquainted with the movers and shakers in that organization here in St. Paul. As I mentioned, this led to my opportunities for consulting work and then to accept the position at the University of Minnesota.

ASPRAY: You were doing your consulting work for UNIVAC?

STEIN: Part of it, yes.

ASPRAY: Why were you attracted to the position at the University?

STEIN: It was probably psychological. In those days, I believe, the professors used to brainwash the students. They said the good students will become the professors and the ordinary students will be out there working in industry. Consequently, when I found myself working in industry, I had in my mind the stigma of being an ordinary student. When an opportunity came for an academic position, I said, this is what I was educated for and I can always return to industry; so I will try it to see what I can make of it.

17

ASPRAY: Had you started to look for other academic positions while you were at Convair?

STEIN: Yes, I had.

ASPRAY: What were the conditions of your appointment here at the University? What were your responsibilities?

STEIN: I was appointed as an assistant professor in the IT Mathematics Department. My responsibilities were to oversee the use of the gift of four hundred hours of time on the ERA 1103, to introduce course work, and ultimately to do research in modern computing machinery. I introduced a course, which in one form or another we still have around today.

ASPRAY: An introductory course?

STEIN: No, it was an advanced course. It carried graduate credit. It probably involved things that are taught to freshman today, or that they are expected to know when they arrive. It attracted an extraordinary amount of interest. There were so many people there that I had to teach it in two sections.

ASPRAY: This was offered for the first time in what year?

STEIN: In 1955. I had two sections of about fifty people each, which in those days were considered very large sections. I began to try to use the gift of time in the best way that we could. Many people didn't think we ought to be expending our resources on this, and my idea was to show how valuable this gift was. So I actually went out looking for people with applications that would demonstrate this.

ASPRAY: You went to various faculty members and departments?

STEIN: Not so much. Most of these people came to me after we announced that I was here and ready to consult. There was a committee established ultimately under the chairmanship of Gerry Shepherd. It was an University-wide committee. The very first committee was actually under the chairmanship of Professor Hartig, the head of Electrical Engineering.

ASPRAY: What was the mission of this committee?

STEIN: The committee was to establish a policy for the use of this gift of time, and to allocate the hours to the various requesters.

ASPRAY: How did you fit in with the committee?

TAPE 2/SIDE 1

STEIN: One might say that I functioned as staff for the advisory committee. I received the requests, made the recommendations, and then worked with the people that were allocated time by the committee. Ultimately, they made me a member of the committee as well.

I was looking for the most likely projects among all the requests. I selected two. One was in low-energy scattering of electrons that came from the physics department. The two people involved in that were Alfred Glasgold and Warren Cheston. Cheston subsequently became Dean of the Institute of Technology. They were assistant professors of physics in those days. I worked personally with them to set up the mathematical models and the programs that would be needed. The other was a very large project in crystallography, on molecular structure, which was under the leadership of Bill Lipscomb, a professor of physical chemistry. He came over with about ten of his graduate students, and I established a seminar that they attended once a week for about a quarter. Then they went off on their own. This led to some very important work, and subsequently Lipscomb won a Nobel prize for it.

We had other things which I considered very useful pieces of research going on. But I didn't involve myself personally in them as much. There was work in spectroscopy, under Bryce Crawford. A large variety of useful research began. Even at that early day we didn't neglect the educational or instructional use of the computer. Some of that time was provided to instructors who wanted to use computing in conjunction with their teaching. Of course, I myself probably made the most use of it; but I don't think I was the only one.

ASPRAY: Can you give me an example of the way that you used it?

STEIN: As I said, I established a course. I would suggest some type of exercise that would illustrate the ideas that I was discussing. Then we would have one student who would volunteer to illustrate that, and actually carry out the exercise on the computer. That student would write a report. All the other students would receive a copy of that

report and their assignment was to do a critique of it. I had a number of people who subsequently made their mark using computers in their own fields of research. For example, Lawrence Liddiard, who is now the acting director of University Computer Services, was a student in that course. I still remember the project that he undertook -- exceptionally well, I might add.

ASPRAY: What was that?

STEIN: He wrote a program to solve some systems of differential equations. Early on, the advisory committee set up policies, mainly through my advice. One was that people had to do their own programming, though we would assist them in every way possible to do the work themselves. I think this had a great trickle- down effect. It made for a much better and really a much higher level use. People would come in for their first job and instead of going away after we had done it for them, and maybe never coming back except to do that over again, they would suddenly realize what this system could really do for them. They would begin the important things that they subsequently did. There were also a lot of graduate students who were given free access for their research. As I said, a lot of these people subsequently went on to other faculties and became experts in using computing equipment in their work. I am

thinking of people such as David Campbell, who inherited the Strong Interest Inventory; he was a student of mine. We had them from many fields: Frank Baker, who is now a professor at the University of Wisconsin, and heads up a laboratory there in quantitative concepts in education, and so on.

ASPRAY: I see.

STEIN: So I think this gift was really the nucleus of everything that has happened since, and a lot of other good things.

ASPRAY: The work of Baker in education is one example, at least later in his career, of something outside the sciences. What percentage of jobs that were done with your free time on the 1103 were not science or technology projects?

STEIN: I think among the files that you took were all of the usage records. I have to say that if you counted them in terms of time used, the physical sciences and engineering used the most time. But if you counted in terms of projects, then projects from education, psychology, business, statistics, agriculture, etc., were very well represented.

ASPRAY: The gift of the time was a gift to the University as a whole, not to IT. Is that correct?

STEIN: That's right.

ASPRAY: So there weren't any restrictions independent of the project that said that preference went to IT, or that preference went to, say, agriculture?

STEIN: No. There were no restrictions. It was an University-wide committee that operated the gift. The gift was

renewed in 1956-'57. In the summer of 1956, Dean Spillhaus appointed me Director of the Institute of Technology Computer Center, which consisted of the kinds of equipment I mentioned previously, plus the gift. While it was a gift to the University, the administration of it was in the hands of IT.

Also, at that time there was some consolidation. The tabulating equipment throughout the University, which was mainly in the School of Business and IT, was all consolidated and put under the directorship of Professor Kenneth Clark of Psychology. (He subsequently left here and became a dean at the arts college at the University of Rochester.) Then we soon found that we weren't able just to do what had to be done with the gift of time that we had.

ASPRAY: That is, the number of requests for use were greater than the amount of time allotted.

STEIN: Yes. One thing that happened was that the project on which I spent most of my personal time, which was the scattering project, raised some money from the Atomic Energy Committee and from a research program that had been set up at Convair under Charlie Crichfield, a former professor of physics at the University, who was director of research at Convair at that time. We used to go out to San Diego -- in those days one had to travel to use these machines. We spent quite a lot of time out there finishing the computations that we'd begun via the gift. We simply

didn't have the time here. So we decided that we needed our own machine. Warschauski applied to the National Science Foundation for a grant. Leon Cohen, I believe, was the program director for the mathematical sciences then. He came and visited us. On that grant, I don't know whether I was the principal investigator, or if Warschauski was. But in any event, we received a hundred-thousand dollars from the NSF. There were other moneys that were raised, up to about a quarter of a million dollars.

ASPRAY: Through the University?

STEIN: Yes. Some of that may have come from alumni; I really don't know. The advisory committee had people like

Gerry Shepherd, Russ Amundson, and Jack Darley, who was subsequently a dean of the graduate school, on it. At that time he was a professor of psychology. Al Meier was on the committee. You can see that it was considered an important committee.

ASPRAY: Yes.

STEIN: The committee managed to raise the money. At that time, Los Alamos was offering its MANIAC free to anybody that wanted to cart it away. So Gerry Shepherd, Leroy Anderson -- now Emeritus Professor of Electrical Engineering -- and I went down to Los Alamos to have a look at it. We discovered that it was a "breadboard" machine that couldn't live away from the people that had designed and built it. While we were there, the people at Los Alamos, Metropolis was leading the group there -- he offered us their plans for MANIAC II, which was to be an advanced version of the machine, with a CRT memory. All we had to do was agree to build the machine. So we actually did that. We used this as part of our money-raising activities, although the idea of building a machine wasn't all that exciting to me. But you have to remember that Shepherd and Anderson were electrical engineers and were much more comfortable with the idea of building a machine. As I now recall, that was the vehicle for raising the rest of the money that we did get, the money to build that machine.

ASPRAY: I'm confused at this point. Did all of the money that was raised go into the building of that machine, or did you also purchase a machine?

STEIN: You see, we never built the machine.

ASPRAY: You never built a machine, you just said you were going to.

STEIN: Yes. Russ Amundson was consulting for UNIVAC in those days. A gentleman named Stutzman was quite high in their organization. He subsequently founded his own process control business in this area. Amundson came

back and said, "They'll sell us an 1103 for a quarter of a million dollars." Just what we happened to have.

ASPRAY: Wasn't that convenient.

STEIN: So we decided that we would buy the 1103. I very reluctantly at that time rejected another offer to build a machine. This one came from Seymour Cray. I had lunch with Seymour at the Campus Club. Control Data had just gotten off the ground then. He sketched the machine on the back of an envelope and said, "Why don't the University and Control Data jointly agree to build this machine? We'd build it on the campus of the University of Minnesota. And after a certain number of years, maybe three years of joint use, it would become the sole property of the University." It was a very attractive machine that he sketched, which ultimately turned out to be the CDC 1604. I had no doubt that they had the ability to build the machine. But we were under pressure to get a machine immediately. There was the waiting period, and the fact that there was no software. We already had a lot of work underway with the 1103. This was also a consideration: Control Data was not financially a very strong company. They didn't have the space to build the machine, and they didn't have the capital to build the machine, judging by their offer. And then we would have had to share the machine for that period of time as well. So knowing that ultimately I would certainly like to have that machine -- and ultimately we did acquire it --I reluctantly had to turn him down. Then, of course, there was the fact that they were being sued by Remington Rand. The outcome of that was not known. Frankly, it didn't look very good for them. I still have never understood the settlement. Of course, I wasn't privy to any of that.

We acquired the 1103. At that time we organized an University-wide center which was called the Numerical Analysis Center, with the 1103 as its heart. The center was budgeted with something like twenty-four thousand dollars, which seemed like a lot of money at the time. I was appointed the director of the Numerical Analysis Center. I told you that the tabulating equipment had been put together. They gave us the tabulating equipment, and we had the REAC and the 1103.

24

ASPRAY: What size staff did you have?

STEIN: I had a very small staff. Well, actually, the tabulating staff was probably the biggest part of it. I had myself, a secretary, the people who provided the tabulating services. Maybe six, I'm guessing now, my memory is failing. About six to ten half-time research assistants. But, again, I provided you with the budget statements for all budgets that we had in those days. So we can determine the exact size of my staff if we look at that.

ASPRAY: Were you doing any teaching?

STEIN: Yes. I always taught. I had all the duties of a professor in mathematics, and luckily for me, after one year as an assistant professor, I'd been promoted to the tenure rank of associate professor. I spent my time developing research and coursework, and developing the Numerical Analysis Center. I was joined in those early years by Bill Munro who is now associate head of the Computer Science Department. We were pretty informal in those days: he was associate director or co-director. He was Acting Director in the years I was on sabbatical. I could not have accomplished nearly half as well without his advice, and his help in almost every project. That was starting in the second or third year I was here.

ASPRAY: So that was about 1957 or so?

STEIN: Yes, he was on sabbatical when I first arrived here. It didn't take us very long. Probably by the end of the 1950s, it was clear that we had used up the capacity of the 1103. So we set about looking for a replacement for it. Another interesting thing that we did was mating it to the REAC. We designed and built one of the first hybrid computers.

ASPRAY: So you took your 1103 and tied it to the REAC?

25

STEIN: Yes.

ASPRAY: What was the purpose of that?

STEIN: I've always had a great interest in simulation and in continuous system simulation. There is something known as the Stein-Rose sorting algorithm, which is the theoretical basis for continuous system simulation. The kinds of continuous systems that one simulated in a way were analog computers. Part of the simulation is that you have to describe the system that you're simulating. Parts of these systems were better described by analog computers and other parts by digital.

TAPE 2/SIDE 2

STEIN: Describing the system and describing the control had analog and digital aspects to it. I thought that this kind of hybrid machine would function very well in problems like that. Historical users of the analog system were quite interested in this. For exa mple, simulating missile flights and missile control looked like a very good thing to do. It's the kind of thing I'd been involved in myself. Convair and Honeywell Aero had an interest in it. So we actually built a machine to do that. I have to admit it was not a great success. One thing we learned is that you should never put your prime machine into that kind of a system. That's where I learned about programming difficulties.

ASPRAY: Will you elaborate on that?

STEIN: What happened was that we found that our digital computer was tied up all the time while we were tinkering with wiring up the plugboard for the analog for checking, testing, and so on. So the effective use time on the digital machine was comparable to what one would expect of an analog machine.

STEIN: Yes. Also, I didn't feel all that comfortable with the part of my empire in the Engineering Shop. But as we did

our own maintenance on the 1103, we had to have it. But looking forward to our next machine, which was obviously on the horizon then, I knew we weren't going to do the maintenance on it. We thought we would go out and get a commercial hybrid computer. At that point I worked with N.R. Amundson, and we obtained about a half-million dollars for that purpose from the National Science Foundation and the NASA; we had to agree to install this facility in the Space Science Center. We went out and we bought, or had designed and built for us, a hybrid computer based on an Engineering Research Associates' computer. And we had a Control Data 1700, which was a small computer that CDC developed mainly with process control in mind. We also went out and got the 1604, as I said I had known we would eventually.

ASPRAY: In what years were these acquisitions made?

STEIN: We got the 1604 in the sixties, in about 1960. I'd have to look at the record.

ASPRAY: And the hybrid machine?

STEIN: The first hybrid we built in the late 1950s. The second one came about -- the planning, money raising, design, and then building -- all went on in the early sixties. We actually got that machine in about 1966.

ASPRAY: Was it a success?

STEIN: No. It was more of a success than our first one. But by the time we actually got it, digital computing had improved so much that there wasn't a lot of interest left in analog or hybrid computing. The good cases just became too specialized. It was useful as a hands-on facility because our digital facilities were behind glass; our first one had been all hands-on and open-shop. It had some interest in another way because after all it allowed us to do parallel computations. The two machines ran simultaneously and had to be synchronized. So it led to some thinking about parallel computing, which was not all that important a subject in those days as it obviously is today. I'd have to say

we were among the first people who were involved in and thinking about parallel computation, just how to use two machines that could run and work at the same problem at the same time.

We developed the use of the 1604. It was a great machine; I really loved it. I think Seymour designs beautiful machines. We had it loaded down, and it became clear that it was time to go out and get our next machine. President Wilson came in about the time we were thinking about 1604. His advice was to get the best machine we could, not to worry about what it cost, and not to get something obsolete -- not to think about things that were obsolete, because we couldn't conceive of raising enough money. As it turned out, he was right. We got a half-million dollars from the NSF, which was at that time one of the biggest grants ever given by them for that purpose. We received an appropriation from the legislature, which may have been their first direct special item for buying a computer. That was a quarter of a million dollars. So we came up with three quarters of a million dollars for that system, which was retailing for about a million and a half. We managed to acquire it for that amount of money.

ASPRAY: Before we go on, why don't we talk briefly about the 1103 owned by the University, and some of its outside uses. What sorts of problems by outside groups worked on the 1103?

STEIN: We had outside users, but we didn't actively go out and solicit outside business. One of our restraints was that we didn't care to be in competition with various manufacturers with whom we had to do business in other ways, and who were operating service bureaus. We allowed outside use if there was clearly some justification for it: if we had some type of unique program, or if it was one of our students who had received his or her degree and had gone to work for an outside organization, and wanted to come back to do something on the equipment that he or she had written the program for and was familiar with.

ASPRAY: So continuity was a criterion?

STEIN: That was the kind of thing we looked for. I remember turning down offers from Honeywell to buy thousands

of hours, primarily because it seemed that we ought not to be in competition in that way. Also, our faculty and students were making good use of the time. We were pretty heavily loaded. We didn't want to get into a position where we essentially said, "Too bad for you, but we need the money." Our system was blind as to whether the user

was paying for the usage or not. It might have been naive of us, but that is the way we operated. Students had as good access as research projects that paid. And I was a little worried that these outside users who were putting down large sums of money would demand priorities that at that time I didn't want to concede to them. Maybe if we needed the money, or if I knew more about money in those days, we would have done it; but we didn't. What the applications were, I don't remember. You could probably find them in the files somewhere.

We had other kinds of relations with outside organizations, because all computers have user organizations. We were active in the national user organizations: the UNIVAC users' organizations when we had the 1103, the CDC users' organization with the 1604 and, subsequently, with VIM, which in Roman numerals you can interpret as 6000. Also, I recall that we had a sort of a Twin Cities users' organization that included the University, industrial, and some business users, I believe. I served as the first chairman of this organization, and I remember the trials and tribulations of trying to arrange programs.

ASPRAY: What was some commonality of interests between these various local groups?

STEIN: Just computers. I believe that in the Twin Cities, there's a chapter of the ACM, the Association for Computing Machinery functioning now. That chapter grew out of this group. I participated in getting it off in its beginnings. I was the first chairman of the group, and I was the first program director. We had people like John W. Carr III, who at that time I believe was the president of the ACM, come out and speak to us. Mainly our programs brought in academic and not so many business people. I presume it was because those were the people I knew the best.

ASPRAY: Again, on this early period, where was Minnesota in comparison with some of the other universities that

are regularly compared with it - the big research midwestern universities like Wisconsin, or Illinois, and Michigan?

STEIN: In terms of hardware and software facilities, we were equal to any of them. We developed most of our software facilities ourselves. In terms of the amount of money that was being spent, we were lagging far behind. In terms of the national publicity that we were getting, we were way behind. That was probably our own fault. For what we were doing, we should have had a lot more publicity. I think we ran a computer center that was the equal of anybody's. There was one professor down in the medical school who always complained about our center. He was one of these guys that walked in the door the second the computer would go down. We used to make it hard for people to take their work elsewhere, especially if they had financing. But we allowed him to take his to the University of Wisconsin, where he claimed that they had a program much better than ours. Within a month, he was back and very apologetic. I think that in terms of what we had we were up there. In the early days with our 1103 and our 1604, we always had the best machine available. That even became more so when we went into the 6600.

I was on sabbatical in 1963-64. All the time I was gone, I kept thinking that we had come to the end of our rope as far as the 1604 was concerned, and that we had to get a new machine. When I came back we began to work on getting a CDC 6600, which was the supercomputer of its time. We had a grant of over nine hundred thousand dollars from the NSF toward that machine. We also received authority from the regents to borrow the balance that we would need beyond that. I might add that that grant from NSF was one of the biggest that they had ever given for that kind of a thing. The only bigger one that they had given up to that point was to the University of Texas. And since Texas had the President, and we only had the Vice President, that's what we had expected to happen. But we received almost as much as they did. The regents, I think for the first time, agreed to borrow money. They had various negotiations, and we finally arrived at a contract with CDC. The machine that normally would have gone for about three million came in for about a million and a half. I'm sure the actual contract is on file, so you can check those figures.

At that time, I thought we had established a computer center that was second to none in any university. It was a supercomputer and put us in a position to really take off. We'd built up the staff to about seventy full-time i We had

leased the NSP building out on Highway 280. We put in a network because our main computer was out on Highway 280. We then had a concept of it as being the center of a network of subsidiary computers at different locations on

280. We then had a concept of it as being the center of a network of subsidiary computers at different locations on campus. These would have the ability simultaneously to do some local kinds of work, which would be tailored to the local interests, and to send work back and forth to the main machine at Lauderdale. We actually established that with such centers on the West Bank, in the Medical School, and on campus in Experimental Engineering and in Space Science. It was a very successful concept, and at the time, we were looking ahead to tying in Duluth and all the other branch campuses. And I felt that in order to properly exploit the potential of this supercomputer center, which was still called the Numerical Analysis Center, we needed a graduate program in computer science.

DATE: 7 November 1984

TAPE 3/SIDE 1

ASPRAY: This is the a second [session of an] interview with Marvin Stein in his office at the University of Minnesota on the seventh of November 1984. The interviewer is William Aspray of the Charles Babbage Institute. In our last interview [session], we discussed the development of the computing center. Computing activities, especially the machinery that was purchased or donated to the University up until the founding of a graduate program in computer science. Let's go back and discuss some of the educational issues -- the development of programs, the pressures to build up a program in computer science -- and then talk about the formation of this graduate program.

STEIN: When I arrived here in 1955, my mandate, as I took it, was to introduce the use and application of computing machinery to the University, to introduce course work about modern computing machinery as devices of intrinsic interest, and ultimately to introduce research about computing and computing machinery. I began with a course in 1955, a three-quarter sequence whose name I don't remember, about the hardware and software organization associated with modern computing equipment. There were so many people attending that first meeting, as I recall.

31

Maybe a hundred people, which at that time was considered tremendous;~p thirty or forty to a class in those days. We immediately split that course into two sections, both of which I taught. That was the beginning of a successful course. It contained all the elements of what we teach in computer science today, except for numerical analysis. At the same time I was starting the course I just described, Bill Munro was beginning a year sequence in numerical analysis for engineers. All these courses were in the Institute of Technology Mathematics Department. I'd say that out of those two sequences almost all of the current curriculum in computer science developed. What's left of the course I started is the content of our two-quarter sequence, 5101 and 5102. The attendees were mainly graduate students.

ASPRAY: In science and engineering?

STEIN: In science, engineering, psychology, education, life sciences.

ASPRAY: What were the prerequisites for taking the course?

STEIN: I'm not really sure I recall. Probably the prerequisites were something like upper-division standing and a year of analysis. As I viewed it, the prerequisites were just a reasonable order of intelligence and some kind of experience dealing with symbolism and its manipulation.

ASPRAY: Were undergraduates admitted?

STEIN: Yes, and there were undergraduates in the course. But I'd say the majority of students were graduate students. A number of the students have gone on to make names for themselves in computer science, in the application of computational techniques, and in their own areas of expertise.

ASPRAY: Were the students in this three-quarter sequence exp ected to do a certain amount of laboratory work?

32

STEIN: Yes. We began to use some of the time that had been given to us on the Engineering Research Associates 1103, in connection with this particular course and also in connection with the numerical analysis sequence. The students developed quite an expertise in dealing with computer equipment. This was not only the students from engineering, physical sciences, and math, but as I said from a wide spectrum in the University. I recall one graduate

student in sociology, who upon completing his degree went to another Big Ten university as an assistant professor. He came back on a visit and stopped by to see me and just wanted to tell me how useful the course was. He had become the expert in his department, and he didn't have to believe the so-called experts in the computing center when they told him, "Oh, that can't be done." So he was quite enthusiastic about that course and the kind of education that it gave him.

ASPRAY: Did you teach the students about some of the equipment that was available at the time other than the ERA 1103? Say, the IBM punched card equipment you had at the time?

STEIN: At the very beginning we didn't have any punched card equipment, and we worked with paper tape. When I arrived at the University I was given an office and next door to it another office that was called a lab. The sole equipment in that lab was a Flexowriter, which is a kind of typewriter that is equipped to read and produce paper tape. This was our sole source of input and output on the ERA 1103.

ASPRAY: At certain other schools --I'm thinking of Wisconsin and Michigan -- over a period of time, the faculty had to develop new compilers or other kinds of operating systems, and various kinds of software to help with the coursework for the mass teaching of students. Was that your experience here also?

STEIN: Yes, except that I became the director of the University Computer Center, which was originally called the Numerical Analysis Center. I had staff and they helped with developing software that would be useful in the instructional aspects of computing as well as with the software that would be useful in the research aspects. We

always tried to run an integrated center which was accessible for instructional use and research use without either group of users feeling put upon by the other. I think we were very successful in this endeavor. We didn't have any political or other quarrels among the actual users of the equipment.

ASPRAY: Can you give me some of the examples of this software either for research or instructional purposes?

STEIN: For one thing, we had developed, the University of Minnesota Fortran. It was developed under my direction, but under the direct leadership of Lawrence Liddiard, who is now the acting director of University Computer Services.

ASPRAY: When would that have been?

STEIN: That started about 1960. We developed a number of Fortran systems. This was particularly true when we began to use the CDC 1604. It had been the habit of Seymour Cray, the designer of the 1604, to develop some software that he used in the factory which generally was not the official software that purchasers of the machine would get. We had access to the software that Cray himself used. Using that as a starting point, we began to develop our own University of Minnesota Fortran and also our own operating system. We repeated that when we went from the 1604 to the CDC 6600. This was also a Cray-designed system. Again, we obtained the software that he had been using during the design and testing phases of that machine, and improved it to what ultimately became the University of Minnesota Fortran -- UMF, as we called it. A very well known and widely used Fortran system.

ASPRAY: Used well beyond the University of Minnesota?

STEIN: Yes. We had a number of Canadian universities that used it. It was used by the Tel Aviv University in Israel, the Hebrew University in Jerusalem. I believe that the University of London made use of it, and there were a number of others. In addition we developed our M-O-M-S, or MOMS system, our operating system which served us

in good stead until after I'd left the Computer Center. Then a fundamental change in management philosophy occurred. There was a decision made to go with the official software that was produced and maintained by the organization from which we had purchased the hardware equipment. Those decisions were connected with the so called "unbundling" that occurred. I forget the exact year.

ASPRAY: 1956?

STEIN: No, it would have to be in the 1960s, or maybe even in the early 1970s when it became a significant thing. Software became a separate item that was purchased. In the first contracts that I wrote, I purchased three systems, software was never a consideration. We just received whatever software the manufacturer had that would be given

to us free of charge. When I came back as the chairman of the committee that negotiated the contract for a major update of the CDC-6600 into the Cyber 74, the majority of the language in that contract was devoted to discussing software. Probably in that kind of environment the University couldn't depart too far from the official softwares. In any event, we did things like that on a grand scale.

In 1966 and 1967, we had many plans for introducing a computer network, and the CDC 6600 was installed. When we purchased it we decided we'd install it on campus in the Experimental Engineering building. After the architects that we employed presented their plans, we put them out to bid. The cost proved so prohibitive, that we decided to lease a building in Lauderdale, on Highway 280, from the Northern States Power Company. This building had been their computer center and research lab up to that point. We were able to install the CDC 6600 there at a very low cost. But it was a site four or five miles off campus, so we immediately began to think about communications and networks. Our design was that we would have the CDC 6600 as the center which could then communicate with medium-sized remote stations, the capacity of, say, a CDC 3200. These stations were to have the ability to communicate at about five to six thousand characters per second with the 6600 at Lauderdale, and then simultaneously to carry on work designed with the interests of some local area such as IT, Space Science, Education Psychology, Physical Sciences, or Medical Sciences in mind.

35

Now, it was our intention to put in a number of these. We actually installed stations like that in the Medical School, based on a CDC 3300, one on the West Bank to be used by the School of Business that replaced their computer center, and also by the Life Sciences Research Center. Those activities, local activities, then became centered on a CDC 3200, and they also had the facility to communicate directly to the 6600. We also had a terminal in the Experimental Engineering Building and one in the Space Sciences Center. We had plans to install one in the new Psychology Building, which was being built at that time, for the use of Education and Psychology, and one in the St. Paul Campus. Longer range plans included tying in the more remote campuses, Duluth particularly. We were looking into microwave communications. We then began developing software to implement these concepts. A particular aspect of that software was to give us the ability to submit a problem to the local activity of the remote computer, and then to have that problem shifted over to the 6600 batch. It would be sent out there, returned to the local site, then returned to the originator. We developed these facilities to go from that local remote use (that is, remote from the main computer) to the central computer without having to remove the problem and start over again. This was also one of the contributions that we made. We also, as I mentioned in our last interview, devised hybrid comp uting systems.

ASPRAY: Analog-digital.

STEIN: Right. We developed simulation languages for so-called continuous system simulation that would simulate the hybrid systems on a purely digital system. These are just some of the samples of software developments that we were doing. I think I've gone somewhat astray from your question.

ASPRAY: That's fine.

STEIN: I'd say that the two courses I mentioned were the only two courses in what we might call computer science, which really didn't exist at that time. Those were the numerical analysis sequence and the one that I developed. They

36

were really supported by the University Computer Center, even though they were given through mathematics. Students could use these sequences for plan-B papers, and they could be examined in the content of this material as part of their written preliminary examinations in mathematics. Subsequently we brought in courses in systems and non-computational mathematics and artificial intelligence. But these were mainly ad-hoc courses that would be given under some special number.

ASPRAY: They would be given course credit, though?

STEIN: Yes.

ASPRAY: Usually through mathematics?

STEIN: Yes. We found that there was really, in mathematics, a great deal of resistance sometimes to giving credit to this kind of work, and also to accepting the theses of our students. They seemed to be willing to accept this kind of material for masters' degrees, but when it came to a doctoral thesis it became quite difficult. While one could be examined in this kind of material as a topic, still a candidate had to take a normal series of examinations covering the kinds of subject matter that people getting degrees in mathematics undergo. That was only natural, and I had to agree with that because those people were getting degrees in mathematics.

ASPRAY: I can understand that very well, too. Were the courses that you mentioned first, numerical analysis and the course that you introduced, offered every year?

TAPE 3/SIDE 2

STEIN: Yes. Those course sequences have been offered every year since 1955, they've always been very well attended, and until recently they've had a high proportion of graduate students. As a matter of fact, particularly in the early days, I was frequently called upon to serve on graduate student committees in a wide variety of fields,

because the graduate school, or at least various graduate group committees, allowed in certain programs that this course could serve as a so-called research technique and could be substituted for a language. Computing and numerical analysis -- computer science, which it wasn't called at that time -- was so new that it was felt that we ought to be on the committees to examine the students. And we did that very frequently for both masters' and doctoral candidates.

ASPRAY: How did these two course sequences change over time?

STEIN: Over time, we took advantage of new things that were discovered or came of interest to the budding group of computer scientists. For example, these courses started before the advent of a language such as Fortran, before the advent of operating systems. We always had an operating system, but at the beginning it was transparent to the users because we were working on an open- shop basis. So if the user thought there was an operating system, that user considered it simply to be the computer itself. But languages, even assembly languages, became much more sophisticated. Operating systems that were mainly software-based rather than hardware-based came into general use, and so we had to provide a theoretical view of systems like that for our students. To a large extent, the course began to deemphasize aspects of hardware organization, aspects possibly of computer architecture, and began to concentrate more on software considerations. We looked at the structure of assemblers, compilers, and operating systems. What we gave up for that was some of the detailed structure and organization of the underlying hardware that we used to teach. For example, we used to spend some time talking about machine arithmetic and the theory of machine arithmetic, which can be approached as very abstract mathematics. But that was deemphasized, and today we have a separate course which runs one quarter and covers that subject and a graduate seminar that is given every other year, maybe sometimes more frequently, that covers the more advanced and abstract aspects of that subject. Today we have a separate course in computer architecture which covers a lot more material beyond what we covered in the beginning.

ASPRAY: Were students encouraged to take both sequences, or did they elect to take both sequences? That is, the

numerical analysis and the other sequence?

STEIN: Yes. Most students elected to take both. That is, most students that came from mathematics, the physical sciences, and engineering elected to take both. Some of the students from the life sciences and social sciences were not so sure that they needed both, so they took the course in the organization and application of computing machinery and software. I think it was mainly that they had some kind of a vocational objective or, in certain cases, they had a thesis topic in mind; I suppose most graduate students at that point learn what they have to learn to complete their research and write their thesis.

ASPRAY: Are there records still available from these courses such as course descriptions or any materials of that sort?

STEIN: I may have some records. I'm sure I have the class record books and so on. But, of course, the catalogs are probably somewhere in the University Archives.

ASPRAY: One can learn a lot more from a syllabus than from a catalog description.

STEIN: Yes. I probably do have some syllabi of mine left over from those days. But, as I was beginning to say, we found it harder and harder to get our graduate students through to degrees. What was very discouraging is that a number of them decided not to go ahead because they felt that they were not really interested in getting their degrees in mathematics, in studying the other subjects that were required. Some of the other subjects were very valuable and interesting, but I'm talking about the complete gamut of subject matter.

ASPRAY: One might think that numerical analysis, logic, combinatorics, and probability all might have some relevance to computing.

STEIN: Yes. But I think what they were talking about is that they really didn't want to prepare for the written preliminary examinations and qualifying examinations over the complete gamut of subject matter. They wanted a course of study directed at their own interests, their own particular kind of research. So, we were losing students to places that had programs.

ASPRAY: Can you tell me which schools those were?

STEIN: There weren't really very many. Stanford had a program, MIT did and possibly the University of Wisconsin did. Another way we were losing students was the following; as director of the Computer Center, I made it my business to conduct a developmental program. We began with undergraduate students and we put them to work as computer operators. But a part of their duty was to have in-house education, and to take the courses that I have mentioned. These students then progressed from operators: they became consultants, and some ultimately system programmers. This progression went along with their educational development as well. Of course we had attrition. I might appoint twenty students at the beginning of every year, have ten of them survive to their BA's, and of those, maybe five would come to work as graduate research assistants in the Computer Center. We would suddenly discover that they would leave because they were finding it difficult to pursue their graduate degrees along the lines that interested them. Perhaps our biggest competitor was Bell Labs because they would hire the students and then let them go back to some university for a year to get a degree.

ASPRAY: To get a master's degree?

STEIN: Yes. We lost some of our best prospects to Bell Labs, and we weren't getting any Bell Labs students because we didn't have a program. In 1966, this really began to hurt us, because at that time we obtained the CDC 6600, which was the supercomputer of its time and I felt that this put us in a position to assume the leadership in computing and computing science among the universities in the United States. In order to do this, we had to build up our staff properly. As part of the grant from the NSF, we had funds not only for acquiring the equipment, but for

building a staff. Yet I really felt that it would be difficult, if not impossible, to build up the staff properly and to retain the staff without a program, a solid program, in computer science in the university while the students that we had developed were going off to Bell Labs and other places. Some of them, as I recall, went to UCSD. I'm particularly thinking of two of them who did very nice Ph.D. theses out there in mathematics, but with computer science subject matter.

In any event, what I believe I was talking about was our decision that we could not exploit this leap into the future which we potentially could make with the CDC 6600, without having a strong academic program in computer science in the University. Late in 1966, I decided that we should try to go ahead with a graduate program in computer science. The graduate school appointed a committee to study the matter. Up to this point, the only academic program we had was some kind of a concentration or minor in computer science that one could get with a bachelor's degree in mathematics. It was so difficult that I don't know of one student who ever completed that program. I talked to the then Acting Dean of IT, Frank Vebrugge, into appointing a committee to study the problem and it was, if I may

say so, a very distinguished committee consisting of N.R. Amundson, who subsequently became a Regents Professor; Lawrence Marcus, who also became a Regents Professor; Warren Cheston, who subsequently became Dean of IT; Hans Weinberger, currently the head of the Mathematics Research Center here; George Collins, who was then the head of Electrical Engineering and has resumed that position after some hiatus just recently; myself; and Bill Munro. The committee came out with a favorable report. I don't have the exact date; the committee report I have is in the archives and so on. It was accepted by the graduate school after discussion by all the group committees and by the executive committee. A program that we called Computer and Information Science was established late in 1967.

ASPRAY: What about hiring a faculty?

STEIN: Hiring a faculty turned out to be a problem. We soon found out that, while we had enough mass to establish a decent program, it would be impossible to maintain that program at any reasonable level for very long, considering how quickly the field was changing, because we had no access to curriculum. We could not introduce any courses

without putting them through the curriculum committee of some department that was not terribly interested in allocating any of its resources to a new program. We couldn't hire faculty. We couldn't hire graduate assistants, except by using funding that was available in the Computer Center. This funding was limited. We did have a small amount of flexibility in this matter because Dean Spilhaus, at my urging, had allocated two positions to this new area, Computer Science. Spilhaus' attitude, "If we have a new horse we have to back it," I considered very commendable on his part, and he gave two positions to the program. The positions, however, were assistant professor positions he felt should be attached to mathematics. The recruiting, however, was to be jointly between the University Computer Center and the Mathematics Department.

ASPRAY: Were the qualifications for the people to take these positions somewhat a mixture, in the sense that mathematics wanted to use these people part-time for their own aims?

STEIN: Yes. The fact is Mathematics wanted to use these people full-time for their own aims. We had difficulty agreeing on the people, although we went out and we tried to recruit people upon whom we did agree. Unfortunately, we didn't succeed in getting them. A couple of the people we were after, young fellows at that time who had just finished their graduate work, subsequently went on to make excellent reputations for themselves. They didn't want to come to a completely new program. We did manage to get some visitors on those positions. One that I can remember was Joseph Gruska working in automata theory and computational complexity. He came from Czechoslovakia, and now he is a rather eminent person in that particular area at the University of Brateslava, I believe.

We had difficulties. We couldn't reward people very well because we didn't control any budgets to speak of. We couldn't introduce courses. We couldn't hire people. So we would, in a few years, just atrophy. I went to warn Cheston, who by that time had become the Dean of IT. We pointed out the situation to him. After the discussions in which Bill Munro participated, we went back and wrote him a letter summarizing what we had discussed. He agreed to the points that we had made, that without a budget the program would atrophy and without an undergraduate

program it was going to be pretty difficult to get a budget. So we proposed at that time to introduce a department with an undergraduate curriculum to support. He agreed and he appointed a committee consisting of four people: myself, Johannes Nitsche, both of us from Mathematics, and Richard Kain and Bruce Lee, both from Electrical Engineering. We were given a budget and a mandate to define and organize the department and the program.

ASPRAY: This was in what year?

STEIN: This was in the beginning of 1969.

ASPRAY: So, essentially, you tried through 1968 to get the program on its feet without support?

STEIN: Yes. We found some people inside the University who wanted to be associated with the department. Bruce Lee was chairman of the organizing committee. For purposes of recruiting, we thought it would be better to refer to him as Acting Head of the Department. He functioned as chairman under that particular title. We organized the

department, defined a curriculum, and went through the various approvals that had to be obtained -- the faculty, the regents, the higher educational coordinating commission, and so on. In the academic year 1970-71, we began functioning as an independent department.

TAPE 4/SIDE 1

STEIN: During this organizational period, we were teaching our courses and trying to function as a department. But, the courses were being offered through Mathematics, and we were in temporary space that had been made available to us in Experimental Engineering by the Computer Center -- by me, as director of the Computer Center really. But, by the 1970-71 year, we were able to move into the area that we now occupy in Lind Hall (not as much of it as we have now, but enough for that day) and to begin functioning as an independent department with its own budget, its own faculty, its own curriculum, its own everything -- including its own troubles, which every independent department

has. At that time, I decided to resign as director of the Computer Center and to transfer my appointment as a professor of mathematics to the new department. I was, in that first year, functioning as acting head of the department.

ASPRAY: Before we go any further, I have a number of questions about these early years. Can you specify for me who the faculty members from the university were who came over to participate in the computing center at the beginning?

STEIN: Yes. Ultimately, I came over. Bill Munro went into this almost at the outset of the organizational days with the title of Associate Department Head, which he still has. And there was Jay Levitt, who was an associate professor.

ASPRAY: In mathematics?

STEIN: His title was Associate Professor of Computer Science. In those days, there was a process where people who were appointed in one department and had most of their responsibilities in another department could obtain promotions, without their titles necessarily reflecting any department, but rather more or less what they were doing. So actually, Jay Levitt and Kris Frankowski were both appointed as assistant professors in mathematics who spent most of their time in the Computer Center and also in teaching the kinds of courses that sprang up from the two sequences that I mentioned at the beginning of our talk. They were promoted to Associate Professors of Computer Science under that special process. Both of them came over to the department when it was organized. Frankowski is still with us, and Levitt is now at SUNY Buffalo, where he is the Director of Academic Computing. We also hired as new assistant professors two of our graduate students who had obtained their Ph.D.'s. The first one was Duane Zimmerman. He was our first Ph.D. student, and he had to remain another year while his wife finished her Ph.D. in mathematics. Both of them, I think, went to a university out in Southern California. Zimmerman joined our faculty, though we knew he would only stay a year. Then, we hired Bill Frante who had been with me since he had been an

undergraduate. He was one of these people whom I had put into our training program, which I discussed previously, and he had become a graduate student and als o functioned as Operations Manager for the University Computer Center until he obtained his degree. I was his advisor, and we hired him as an assistant professor. At the time, he didn't think he was going to stay very long. We didn't think it was, in general, a good idea for former students to remain very long; but he went off on a very independent and fruitful line of research and, at the end of last year, he resigned from our faculty with the rank of full professor. I think he's president of a venture capital company in this area at the moment. That was the original department faculty, assembled from among University faculty and former graduate students.

ASPRAY: The 1968 curriculum had just appeared at the time. What role did it play in the development of your own curriculum here at the University?

STEIN: To tell you the truth, we were very aware of the developments of the ACM curriculum committee, particularly. But I don't know that what they had set down played a great role in our curriculum development. What

did play a great role in curriculum development was something rather more general. For one thing, the Institute of Technology, when I arrived here in 1955, was awarding five-year bachelor's degrees. The five-year programs were abandoned, and departments went over to four-year programs. There was quite a lot of discussion as to what a suitable four-year program was. Dick Jordan, who was head of Mechanical Engineering at that time, and who functioned for several years after his retirement as Associate Dean of IT, chaired a committee to define a four-year degree program in the Institute of Technology. He examined questions regarding its objectives, such as whether to train the professional or to develop somebody who had a broader background and who would then have to become more specialized through a specific employment in the field. He came up with a program whose objective was to train people in a more general way: people who could see the influence of the social sciences on engineering, and so on. These curricula were to have many electives. The electives were quite open, and about that time, the proper liberal arts education for any graduate of the University had been more or less defined. There was a liberal education requirement, and I think the Jordan reports took that very much into consideration as well.

45

That was the atmosphere in which I was functioning as chairman of our curriculum committee; that was the atmosphere I was working in. We developed a curriculum that did not try all that hard to train people in narrow specialties, but was open and had a lot of electives in it. It was my hope that we could work with what we called the senior elective, which was composed of a number of credits, half of which had to be in comp uter science and half in some related field, usually in IT though not necessarily, but generally in some obvious field of application. In those days, obvious fields were even fields such as political science, economics, and education as well as electrical engineering, math, statistics, and so on. We thought, if we could combine this elective with liberal education, that we could produce at the bachelor's level people who might go on to graduate school in other areas and bring computer science to important applications, or else who would be well qualified to work in government, industry, or business, but primarily in areas of applications of computer science. While I think we were successful, to a large extent we weren't as successful as we had hoped. That is mainly because, in the long run, we didn't know enough about the requirements of the other areas. But I think we still have that philosophy, and it works. Of course, we have students who take all the electives that they can with intense concentration in computer science, and those are the ones, primarily, who are going on to graduate work in computer science.

As far as the specifics of the curriculum, I don't know that we were radically different from those that were proposed, particularly by the ACM, but we didn't really study it that hard. We felt that we knew enough about it, that we had been working in this area long enough, to know what we wanted to do. We already had a start, and courses that were extant, and so we had a certain basis to begin from. I remember we introduced a so-called undergraduate minor in computer science, so we had that to look at. Our product developed from our own experience, that minor, the Jordan report, all of which reflected the needs of the University of Minnesota. Of course, we then compared what we did to the ACM curriculum recommendation.

ASPRAY: Did you look at the curriculum of any other universities very carefully at all? Stanford, or Purdue?

46

STEIN: Stanford was primarily a graduate program. We may have looked at Wisconsin. The reason I say that is that in the year that I was doing all this, we had retained J. Ben Rosen as a consultant, who at that time, had just retired as head of the Computer Science Department at the University of Wisconsin. So we certainly had his ideas and his input in the process. I remember I would send in the minutes of every curriculum committee meeting, and he would reply with his comments and suggestions. But, I can't say that we were influenced by any place very mu ch.

ASPRAY: What about the number of students you were getting in the early days? Had you had any students participate in the program that ran for just a short period by itself?

STEIN: We had very few students who tried that minor. It was a program that was still reminiscent of the five-year degree. To complete it, one needed well over two hundred credits, whereas the programs developed under the influence of the Jordan report required about a hundred and eighty. While the cost of tuition wasn't that big a consideration in those days, it still was some consideration, and in order to have a minor in computers or computing on their diploma, I don't think students were willing to forego the opportunities that were then available to them in business and industry, just to spend the extra time and

money.

ASPRAY: What about the development of the undergraduate program? How long did it take for enrollments to pick up there?

STEIN: My forecasts were that we would have about 100 students in each year. In about six years, that came to pass. We started in our first year with probably about fifty students. This was with a curriculum in the Institute of Technology. Subsequently, very shortly after that curriculum was approved and functioning, I began talking with people in CLA about a curriculum leading to a Bachelor of Arts degree in Computer Science. (The IT curriculum leads to a Bachelor of Computer Science.) These talks were cordial and were nearly completed by the end of 1970-71. They were well advanced, while I was still chairman of curriculum. Then, I turned this over to a new member of the faculty, Ken Brown. I had hired him while I had been acting as head in the first year. I also hired J. B. Rosen, who decided to leave Wisconsin. He was to come as the department head. Brown culminated the CLA negotiations. We now also have a CLA curriculum. In the Bachelor of Computer Science program, we now have a total of about six hundred undergraduate majors. I would guess we have another four hundred in CLA who are candidates for a Bachelor of Arts degree in computer science.

ASPRAY: How do the two curricula differ?

STEIN: In terms of the required technical courses, they don't differ at all. The IT program has the senior option, which meets concepts that were suggested in the Jordan report and is therefore akin to a type of what you'll find in other IT curricula. Our senior option differs from the CLA equivalent thing, which is distribution of electives in CLA designed to meet certain college requirements. That is the most significant difference with regard to computer science. Nevertheless, I think that a person in IT who took his senior option with an emphasis in some CLA field would probably end up with about the same number of credits of Computer Science, counting required technical courses and electives, as a student in CLA. The other differences are also at the college level. The CLA students have to study languages, while the IT students have to take physics. As I said, technically there isn't much difference, and I don't see a lot of difference among the students themselves.

ASPRAY: Could you make some comments about the development of the graduate program and about the numbers of graduate students you started to get over time?

STEIN: The graduate program was approved in 1967. The graduate school set up a special group committee for Computer Science, which elected Bill Munro as chairman. The functions of a group committee, in those days, were to appoint faculty, to approve student programs, and things of that nature.

STEIN: When Bryce Crawford, the Dean of the Graduate School at that time, wrote the letter approving the program, he pointed out that the executive committee was rather insistent that it be a very interdisciplinary program. Consequently, we appointed people from a wide variety of fields in the university, from the School of Business, Education, Statistics, the Life Sciences, Mathematics, Electrical Engineering. Of course, we appointed all of the people that were in our department, and we were actively recruiting people. This was before the department, but as we became a department, naturally, we appointed all the people that were at the University, that joined the department, and, ultimately, when we had the department, all the people that we recruited; so that we had a pretty good-sized and a relatively active faculty. There was a pent-up demand for this program, and we also managed to recruit a pretty good new class of students. This was due partly to the fact that the Computer Center had a number of assistantships to offer these people. In the first year, we gave the written preliminary examination. I would guess about 25 students took the exam, which I don't think was too bad to get the program underway. I don't know if you wanted me to go into the details.

ASPRAY: I would like to hear more about the development of the curriculum and what kinds of students you wanted to produce.

STEIN: We were interested in what we considered the core area of computer science, and we were primarily interested in producing students for industry, government, and business to work at research laboratories and, to a certain extent, inevitably, there were those who insisted on an academic career in computer science. We were concentrating on students who were really interested in compilers, languages, operating systems, and the generalized applications of computer science.

ASPRAY: Could you elaborate on that for me?

STEIN: What I'm really talking about is where you're not looking at some specific differential equation, but a class of mathematical problems, and how computer science methodology and computing machinery could impinge on the solution of problems of this nature.

ASPRAY: Can you give me some examples of areas of computer science that the program did not pursue actively?

STEIN: I don't know that we had it in mind to exclude any particular areas. I think if there was one that we didn't pursue actively, it would have been in computer architecture and design; although we always had an intention to maintain a solid interface with that area, particularly in the part that we would call architecture. Design, we had a feeling, was more or less an engineering subject. To the ext ent we were pursuing it, it was through the members of the graduate faculty who were in Electrical Engineering.

If you consider there to be two faculties, the core area faculty would be primarily the departmental faculty. The graduate faculty includes the departmental faculty, but graduate faculties transcend departmental lines. There were the core areas of computer science, which at that time we could think of as software engineering, compilers, languages, operating systems, and the generalized kinds of applications I mentioned, and then the more peripheral areas, which would be more specific applications and would be dealt with in the components of the graduate faculty that belonged to other departments. I would say the more important components, which possibly at the beginning we considered to be somewhat peripheral, were theory, computer architecture, and design. But we always intended to have, in the graduate faculty, people who were also depart mental faculty, who could serve as an interface to these peripheral areas, so that they weren't out there orphaned with no attention from us. That is the way we've tried to develop. I think some of these peripheral areas have drawn closer to the core as the subject has developed and

changed, particularly with the advent of very large scale integration and the rendering of hardware, the least expensive element of a computer system. I believe one can begin to think very much in terms of designing special purpose systems, fit to the application. When that's been made feasible, you won't design a system for some general kind of application, but you'll design really big systems to much more specific kinds of applications.

I believe that pulls the whole spectrum of applications in much closer to the core of computer science. In particular,

you really need the theory, the architecture, and the design aspects. The whole thing has become much more tight-knit. But just how we organize our faculty is an open question being discussed even today.

ASPRAY: How did the strength of having a whole series of high-end line computers affect the program? For a university, you had the best computing equipment that anyone could have.

STEIN: To my mind, it didn't affect it very much. And, unfortunately, I don't think our graduate program affected the Computer Center very much. In the outcome, we didn't take that leap into the future that I'd been hoping for. There were two things that I tried to institute when we started the graduate program, and one was a system by which every graduate student undertook to become an expert in some aspect of the Computer Center's operations, particularly in the software. One would become an expert in Pascal, another in MNF Fortran, another in some part of the operating system, another in something else, and so on... The aim was that these people would serve as resource people in the Department and to the Computer Center. That would establish a special relationship between the Computer Center and the Computer Science program as well. Another thing that I tried, which we had as a requirement, was called the practicum, which said that no student could get an advanced degree in computer science without demonstrating a high level of proficiency in the actual application and use of computing machinery.

ASPRAY: How would that be demonstrated?

STEIN: This would be demonstrated by industrial work, properly certified and documented, by carrying out some special project with a member of the Computer Science graduate faculty, or it could be demonstrated by making some contribution, possibly connected with the idea that I previously mentioned, in the Computer Center. Later, in order to help students with the Internal Revenue Service, because sometimes they were paid for carrying out these projects, and we wanted them to be tax-deductible, we made them a required part of their education. We said that they could do this by teaching, at the appropriate level, the use of computing equipment.

We had that practicum requirement for a while. But one year when I returned from sabbatical, it seemed to have disappeared and I never did find out what happened to it. We began that other scheme, clearly, because the first bunch of graduate students that we had were given appointments in the Computer Center. Those were the new ones, and most of the residue already had appointments in the Center. But I left the Center in June 1970, and the new management really didn't have any interest in pursuing a special relationship with Computer Science. If you want to know the truth, I don't think they had any great interest in taking a supercomputer and developing the potential of that system as a supercomputer and a research tool, which could still be used in an integrated manner to provide for the instructional needs of those times. They didn't pursue it. As a matter of fact, philosophically, they took an entirely different emphasis, which was what I call "Meccizing" the Computer Center, and that is turning it in directions which would be more in accordance with the philosophy of the Minnesota Educational Computing Consortium.

ASPRAY: It's worthwhile to have some of this spelled out.

STEIN: This was a move instituted by state government to coordinate and control all of the computing activities that were supported by the state of Minnesota. It grew out of a study of state computing that was made by a committee appointed by Governor Levander. That committee saw that the University of Minnesota, the state universities, and all education came under this state-supported rubric. A bill was introduced in the legislature, which didn't pass. I probably should consult sources, but I suppose that then they tried for a somewhat more modest success, which would not include everything. Also, they were probably influenced by the passage of the Joint Powers Act. They

came up with this organization, The Minnesota Educational Computing Consortium, which would organize computing for the University of Minnesota, the state colleges, the private colleges, the technical and vocational schools, the community colleges, and all of the public schools, K through 12, as the jargon has it. This organization came to be under the auspices of the Joint Powers Act. I was one of the people who was not very much in favor of its coming into existence in the form that it had. Essentially, it was to take control of all the computing equipment and provide computing services to all of these aspects of education. It might not have intended to take physical control

of the existing systems , but it did intend to have its own systems through which it would control.

I think the new management of the Computer Center was in favor of very close cooperation with MECC, and in order to effect this cooperation, they had to really cut back on the plans that I had had to develop what would certainly be called the Supercomputer Center today. As I said, our name was the Numerical Analysis Center. At that point, we changed to the University Computer Center. I'm sure a lot of the attitudes within the University came right from the top. President Moos felt that this was a way to secure his popularity and standing with the legislature, because the legislature was behind this, or at least he thought they were. As a matter of fact, while initially they had been, by the time it all came to be, there had been a change in the governor and a change in control in the legislature and the legislature actually severely modified MECC in subsequent years. They ultimately changed it to what I thought it should have been in the first place, but by then it was too late.

ASPRAY: Namely, what did it become?

STEIN: It became primarily a consulting organization for K through 12, not worried about maintaining hardware systems or maintaining a lot of control over the use of hardware systems, but one which would work with the public schools and provide applications training to the teachers in using computers effectively. If they had had a broader function, then they might have set up some general standards of cooperation among existing organizations in the state that were already well advanced in computing. There was one area where nobody was really very well advanced, although the University might have had the most experience in it, and that was in communications. They may have provided, even down to the engineering levels, consultation on networking and communications. That's what I thought they should be doing. While they're not doing all of that today, they are concentrating their efforts in the public schools.

ASPRAY: You mentioned University administration a moment ago, which brings me to my next question. How strong was the support from central administration for the development of the Department of Computer Science?

When I look at Minnesota compared to some of the other Big Ten schools, the number of faculty members seems much smaller. Now I understand there are adjuncts and people from other departments that are involved. But, still it seems like the core is extremely small, especially given the large number of students you have coming through.

STEIN: One of the things that I did in the year 1970-71 that I spent as acting head of the Computer Science Department -- which was, as I said, our first year as an independent department -- was making the plan for the development of Computer Science. That plan was made in competition with a number of University departments. We were competing for the right to submit our proposal to an NSF institutional program. NSF restricted submissions to one proposal per university. I wrote the proposal, which was actually a five-year developmental plan for the department. Ours was selected as the most worthy proposal, and I believe that at that point we had the support of the central administration. We certainly had the support of the Dean of IT, who was Warren Cheston, and he told me that even if we were not funded, the personnel part of our proposal could be handled by IT out of deaths, retirements, and resignations.

TAPE 5/SIDE 1

STEIN: This was an oral communication from the dean; he didn't put it in writing. They seldom do. In addition to that, part of our proposal envisaged a computer science laboratory which came to about a million dollars. We were asking the National Science Foundation for half of that. We received the okay from central administration, on the

recommendation of consultants they had hired to survey the future of computing in the University of Minnesota. One of these consultants subsequently came to work for the University. He was Peter Patton, the former director of our Computer Center. The other was already hired by the University and that was Peter Rolle. The two Peters then recommended that we receive an item in the University budget, and it went to the legislature. Unfortunately, it wasn't funded. Neither was our NSF proposal, because the NSF decided to kill its institutional program.

ASPRAY: What year was this?

54

STEIN: 1970. That was a political decision. Institutions weren't supporting the President at the time. In any event, I think I was entitled to the feeling that our program had considerable support. At that time, we had about twelve full-time equivalent faculty members in the program. I had envisaged an expansion to about thirty-one FTE.

ASPRAY: By what time?

STEIN: In roughly five years. I have to step back a little because that also included our graduate students on salary, taking four half-time graduate students as being equivalent to one faculty FTE. Including them, we were expanding from twelve faculty FTE, and a number of graduate students on salary at that time, to thirty-one. This proposal was approved. At least the faculty part of that could presumably have been dealt with out of deaths, retirements, and resignations, if necessary.

The following year, I went on sabbatical. When I came back, I discovered that there was a crisis, and the University was valiantly trimming budgets. We benefitted to the extent that we didn't get any trim. But from that point on, there was never any commitment to the original program. We had a new dean. The dean who was originally with us, you remember, had been a member of the committee that founded the graduate program. He had left. His successor, while not antipathetic to our program, was not particularly favorable to it. I had predicted to the outgoing dean that he wouldn't be. He had assured me that I was wrong. But, nevertheless, that's the way that it turned out. Dick Swalin never did anything against us, particularly, but he never did anything for us, either. We did receive a few new resources and I think we actually got our faculty up to fourteen or fifteen positions at one time. But in 1980, when I started to write another report -- "Computer Science at the University of Minnesota in the Decade of the '80s" -- I think that we were at that same twelve or thirteen faculty members. While our workload had gone up by a factor of 10, (it certainly exceeded the predictions that I had made for credit hours, etc.), the faculty hadn't gone up at all. Nevertheless, the Gorman report rated us number 4 among undergraduate programs in computer science.

55

ASPRAY: This was in what year?

STEIN: This was in 1980. This had to be accomplished through the sacrifice and hard work of the faculty that we had. I just want to make one nasty remark while I have the opportunity; we can edit it out later if necessary. I believe in that same period, the School of Chemistry received fourteen positions. They're part of IT. If there had been a will, there would have been a way. I don't say it isn't partly our own fault; we didn't scream and yell. Maybe our department head should have functioned at that level a little better. He didn't, and I think ultimately that's probably why he had to step down as head. That's only an opinion. We didn't get any of these resources. Today I don't think we will ever get the resources, although my last report called for the number thirty as a minimum, and today the central administration is talking thirty in 1994. In 1994, we'll need sixty. However, I will probably be almost retired by then.

ASPRAY: Let me ask you another question. The University postures itself today as an extremely important resource in the growth of high tech industry in Minnesota. From all that I've heard from you, the department and computing center, especially, were oriented towards serving the needs of the University rather than serving the needs of the outside community, with the exception that your programs were oriented towards producing a number of people for industry and business.

STEIN: Yes. That is the greatest service that we can do them.

ASPRAY: I understand that and agree with that. What I wanted to ask -- maybe I didn't start this the right way --

was about any additional University industrial relationships. For example, adjunct faculty positions, funds from outside industry to help with the educational program, any kinds of job placement for practicum experience. Could you comment on those?

STEIN: Yes. Your concept was essentially correct. The institutions that I've developed were oriented toward

serving the university in the most direct sense to produce the students, to support the faculty research, to support instruction, and so on. I think that, in the long run, the best service that the University can do for the business, and the industrial community, the government, or just for the community in general, is to produce the educated people that they need. But we did have direct relations with industry, mainly, and also with state government. We had graduate student positions where students would do work for which they would be paid, that would be recognized by the faculty of our program, under the direction of a person in industry who would have the status of an adjunct faculty member. We had a number of arrangements of that type.

In Computer Center days, we always had arrangements with the manufacturer of the equipment that we bought, and we had particularly with CDC, arrangements for the development of software. They had acquired the rights to a lot of the software that I mentioned to you. We were paid for them essentially, by receiving exceptionally big discounts and, in other similar ways, by receiving some direct grants of actual cash money for the development of software. I remember one was for the development of a Basic compiler that was in the days before microcomputers made Basic a must. I think CDC wanted that compiler as a point in selling equipment to schools. We had research contracts with industry, and we had industrial people here teaching courses as adjunct faculty members. We had some of our faculty leave us and join industry. For instance, Don Boyd left the faculty and he's now with Honeywell Computer Science, where he's manager of quite a large program. We used the adjuncts in those days usually to give special courses in areas of expertise that faculty did not have. In that case the students were mainly advanced. We used the adjuncts also sometimes to give special courses, topics courses, which we encouraged our seniors to attend, especially those who were interested in going to work upon graduation, as a way of easing their transition into the industrial community. My feeling is, again, that our product is the educated people more than specific pieces of hardware or software; yet we have a little mix of the other as well. I think we contributed to high tech. But I think the advent of MECC took away a lot of our ability to do that.

Prof. Adrian Stokes (born 1887)

1927 (Oct) - Nature Magazine - "PROF. ADRIAN STOKES. Obituary"

Source : [HP005A][GDrive]

PROF. ADRIAN STOKES. T HE death of Dr. Adrian Stokes, Dunn professor of patholog s Hospital Medical School, Univer · ~L on,·has robbed pathology, an the re med· ne, of one who, though he h""l"IA"'LfF'd.y accom lished much, had not yet reac the height of his powers, and his loss, at the early age of forty, is the more poignant because of the tragic circumstances which surround it. Adrian Stokes was the youngest son of Mr. Henry John Stokes, and was born at Lausanne in 1887. There was a strong medical tradition in the family, for many of his forbears had left names to conjure with in Irish medicine. At Trinity College, Dublin, where he graduated in 1910, he early gave promise of brilliance, for he not only gained numerous academic distinctions, but he was also a keen athlete and was a worthy member of one of the strongest cricket elevens that has represented his Alma Mater. After doing the usual house appointments, Stokes spent eight months at the Rockefeller Institute in New York, and then returned to Dublin where he joined the staff of Prof. O'Sullivan. Henceforth he devoted himself whole-heartedly to the study of pathology and bacteriology, and he had become an expert in laboratory technique when the War broke out in 1914. He at once obtained a commission in the R.A.M.C. and served in France throughout the War. Although actually attached to a casualty clearing station as a specialist in pathology and bacteriology, Stokes took the broadest view of his duties and responsibilities. He equipped his motor cycle and sidecar with an incubator, setting up what was in effect the first mobile laboratory in France, and his work did much to restrict the incidence of typhoid fever in the early days of the War. Of the original work which Stokes carried out during this time, his investigations into the cause and mode of transmission of spirochretal jaundice was probably the most important. He identified the spirochrete and demonstrated its presence in the bodies and urine of trench rats, a discovery which led to the suppression of what might have become a very serious epidemic. But it was not only in his own particular branch that Stokes did brilliant work. He was the inspiration of the mess in which he lived. Full of energy and ingenuity, he not only lent a hand wherever one was required, but also he tackled the problems of others and applied his knowledge of laboratory technique to solving their difficulties. He kept himself up to date in the various new methods of treatment and, as soon as he was convinced of their superiority he never rested until they had been adopted in his immediate vicinity. ' Brass hats ' were to him the means of obtaining what he felt was necessary for the good of the sick, gassed and wounded, and his vehement, but clear and cogent, demands for apparatus, drugs, etc., were very rarely unsuccessful. All this he effected while maintaining his own

special department at the height of efficiency. Those who served with him aver that he did more than any other single individual to improve the medical treatment of the troops and to diminish wastage. On demobilisation in 1919, Stokes was appointed to the chair of bacteriology and preventive medicine at Trinity College, Dublin, but in 1920 he was invited by the Rockefeller Foundation, who had been greatly impressed by his work on spirochretal jaundice already mentioned, to join the West African Yellow Fever Commission. It happened that during his visit to Africa very few cases of yellow fever occurred, and his work was necessarily indeterminate. In 1922, Stokes was appointed to the Sir William Dunn chair of pathology at Guy's Hospital Medical School in the University of London, which he occupied at the time of his death. He did much to improve the status of pathology in the School, and he was tireless in his efforts to arouse interest and to stimulate research. Intensely practical in his teaching, he succeeded in attracting brilliant students, and, given the time, he would have created a school of pathologists keen to tackle problems whose solutions might lead to advances in medicine. In April of this year Dr. Beeuwkes, the head of the Rockefeller West African Yellow Fever Com - mission, asked for Stokes's help, for the problem of yellow fever in West Africa was little nearer solution than it had been in 1920. Indeed, it was still uncertain whether it was identical with the yellow fever of South America. The latter disease is carried by Stegomyia Jasciata, the common domestic mosquito, and Noguchi has described a leptospira as the causative organism. Stokes obtained leave of absence from Guy's for six months and sailed for Lagos in May. He was not particularly hopeful of succeeding where others had failed, and his first letters spoke of negative results. In July the outlook was brighter, and in the middle of August he wrote that he had succeeded in transmitting the disease from the human pat.ient to monkeys, both by blood infection and through the medium of mosquitoes. No leptospirre had been found, and he was satisfied that the cause had not yet been isolated. He was then engaged in the microscopical examination of infected mosquitoes in serial section. "It is infuriating to know that one has the virus under one's eyes and cannot see it," he wrote at that time. Then on Sept. 16 came a cable to say that Stokes was seriously ill. He was removed that day to the European Hospital, where he died of yellow fever on Sept. 19. How he contrncted the disease is not yet certain, but it would appear highly probable that he infected himself accidentally in his laboratory. Time alone can show the value of his work on the disease to which he fell a victim; but if, as appears certain, he has helped materially towards the discovery of the cause of yellow fever in West Africa, he would not have counted the cost.

In Stokes's public and private life, transparent honesty and sincerity irradiated his every word and every action ; outspoken and candid, he never left any doubt as to his meaning and' to beat about the bush ' was foreign to his nature. His energy and his capacity for work were amazing, and all the more so when one remembers that his greatest enemy was insomnia, and that for him five hours was an unusirnlly good night's sleep. As a teacher, he preached the gospel of scientific truth with an earnestness born of conviction. His students absorbed from him the right critical attitude towards their work, and the best of them became infected with his own zeal for research. He was generous to a fault, and many a lame dog was helped over a stile without ever knowing whence his help had come. An Irishman by everything but the accident of his birthplace, he loved his country as deeply as he hated those whom he regarded as being responsible for her unhappy state, which was a source of real grief to him. Stokes died in harness, as he would have wiRhed to die, but his premature dea1,h will be widely

mourned by all who arc interested in the advancement of med~c~I knowledge, and eRpecially by those who were privileged to come into intimate contact with_ a personality so vigorous, so stimulating, and so kmdly. T. B. ,T.

1966 (November) - Serving in Iran

The following anniversary announcement identified **Peter Strzok Sr. in Iran as of November, 1966**. For full newspaper page, see : [HN00HR][GDrive]

Marshfield News-Herald (Marshfield, Wisconsin) • 03 Nov 1966, Thu • Page 13

Walter M. Badzinskis of Thorp Mark 60th Anniversary Oct. 29

Mr. and Mrs. Walter M. Badzinski of Thorp, who were married Oct. 29, 1906, in St. Aloysius Catholic Church in Roseau, Minn., marked the 60th anniversary of their marriage on Saturday, Oct. 29, at a celebration held in the American Legion Hall at Thorp. The Rev. Anton Drewnicki, Leo, Minn., officiated at the 1906 nuptial rites.

At 10 a.m. in St. Hedwig Chapel in Thorp, the Rev. Eward Masalewicz celebrated an anniversary Mass of thanksgiving, with St. Hedwig's Senior Choir singing Polish hymns.

* * *

The dinner was served by the Ladies Auxiliary to the couple, their 12 children with their spouses, the grandchildren and great-grandchildren, also Mr. and Mrs. Harold Goodrich, Minneapolis, Minn., brother-in-law and sister of Mrs. Badzinski, and Mr. and Mrs. Joe Kubera, Augusta, and Mr. and Mrs. Andrew Kubera, Thorp, her brothers and sisters-in-law. Priests attending were Father Masalewicz and the Rev. Roy Mish of St. Hedwig's parish.

Table decorations included a bouquet of 12 red long-stemmed roses, a gift of the 12 in-laws and a decorated anniversary cake. There also were potted chrysanthemums from the David Kraemer children of Marshfield. Mrs. Badzinski had a corsage of white chrysanthemums and red roses and her husband had a white chrysanthemum centered with a red rosebud for his boutonniere. Special gifts included silver to Mr. Badzinski from the grandchildren and great-grandchildren and a crystal rosary to Mrs. Badzinski from the grandchildren.

Mr. Badzinski, son of John and Apolonia Badzinski, was born in German Poland at Izabella on Sept. 9, 1881, attending school there for seven years. He also attended a locksmith school for three years. He served in the 14th Infantry of the German Army for 25 months.

Mrs. Badzinski, the former Myrtle Kubera, was born in Poland Dec. 29, 1887, to Michael and Josephine Kubera. She was educated in the town of Reseburg, living in Wisconsin and Minnesota before she married. Following their marriage, the couple homesteaded in Kit Karson County, Colorado, farming for five years. They then farmed in the towns of Withee and Reseburg for 30 years. In 1941 he retired.

Both Mr. and Mrs. Badzinski, who are in fair health, are Catholics. He served School Board District 3 in the town of Reseburg for four years and as supervisor of Reseburg township three years. His hobbies are hunting and fishing and his wife enjoys sewing.

* * *

The 12 children of the Badzinskis are Louis, Thorp; John, Thorp; Mrs. Michael (Josephine) Strzok, Gilman; George, Bayfield; Mrs. Walter (Apolonia) Szczech, Greenwood; Harry, Thorp; Alex, Thorp; Joseph, Colby; Mrs. Stanley (Gertrude) Staszcuk, Eau Claire; Albert, Enid, Okla.; Mrs. David (Elizabeth) Kraemer, Marshfield; and Mrs. Edmund (Valentina) Krych, Minneapolis, Minn. There are 56 grandchildren and 34 great-grandchildren. All of the children with their spouses and their families including the grandchildren and great grandchildren, were present with the exception of grandchildren in the armed services, Richard Strzok in Hawaii, Peter Strzok in Iran, John Badzinski Jr. in Colorado, Michael Strzok Jr. in Connecticut, Ronald Staszcuk in Texas, James Strzok in Missouri and Dennis Badzinski in Florida.

Relatives attending from out of town came from St. Paul and Minneapolis, Minn., Enid Okla., and from Milwaukee, Wautoma, Waupaca, Marshfield, Colby, Gilman, Eau Claire, Bayfield, Greenwood, Barron and Berlin.

The original attending couple, John Kubera and Maggie Quada, were unable to attend due to illness.

A Bronze Star medal with First Oak Leaf Cluster for heroism, awarded posthumously to Sp. 4 Kenneth Verrett, was presented to his mother, Mrs. Donna Verrett, 613 Carrie St., by Major Peter Strzok, ROTC officer at Lake Superior State College. Sp. 4 Verrett, who was killed in action March 31, 1969, in Vietnam, was awarded the medal for valorous action while serving as a team leader with the 8th Cavalry during a search and clear mission in Tay Ninh Province. Although wounded, Verrett had gone to a forward position to evacuate the last casualty when he was killed. Other medals presented to his mother include the Combat Infantryman's Badge, Air Medal, Good Conduct Medal, Purple Heart, National Defense Service Medal, Vietnam Campaign Medal and service ribbon, Expert Badge for automatic rifle, and Marksman Badge for rifle. THE EVENING NEWS, SAULT STE. MARIE, MICH., TUES., JULY 29, 1969 7

Sault Program Outlined

Says ROTC Will Expand

Lake Superior State College's ROTC program will be expanding this fall, according to Major Peter P. Strzok, associate professor of military science at the school.

Strzok spoke to Rotarians at their Monday luncheon meeting.

The program has been changed from an engineering emphasis to one of general military science, stressing the specialties of the students enrolled. Thus, a graduate with a major in finance may very well be assigned to the Finance Corps, which will be of more benefit to both the Army during his active duty and to the officer when he decides to return to civilian life.

Strzok also noted that the staff has been increased 70 per cent, with a complement this fall of two non-commissioned officers and three officers. Strzok stated that the larger staff, combined with a relatively small class size, allows for a better program than some larger schools can provide.

Ray Chelberg reported that proceeds from last weekend's White Elephant Sale exceeded $100, proceeds of which will go to the Boy Scouts and the Camp Fire Girls. In other business, Bill Blackstock, Kiwanis president, was present and presented a check for $20 to Rotary President Bob Champion. The amount was contributed to the Camp Fire Girls, and was earned by the Rotarians by their stellar play in softball last week. Blackstock also presented an umpires medal to Ray Chelberg, who was said to have done the most by his calls to insure a Rotary victory.

Guests and visiting Rotarians at the meeting included Wilfred L. LePage of Monroe, Michigan; Brian Callaghan, Hillsdale; Wesley Logan, Hastings, Michigan; W.O. Shelon, Cheboygan, Michigan; and Dick Malpass of East Jordan.

ROTC Cadets Stage Event At Camp Lucas

There was some puffing and a lot of sweat in old Camp Lucas Friday.

Army ROTC cadets from seven Michigan colleges and universities were in competition at a counter-guerilla invitational meet sponsored by the Lake Superior State College military science department.

Friday's workouts on the physical training courses, battlefield first aid stations, map course and other activities were the prelude to all-night exercises which would take the teams out into the woods and fields.

The Camp Lucas portion of the weekend had individuals and teams competing against the stopwatch in creeping and crawling exercises over a measured course, and making it hand over hand along the high bars in exhausing workouts.

With encouragement from the sidelines, most of the cadets managed to finish individual events. A few fell panting on the grass and then got up to finish off what they had started.

"The first-aid exercises were designed," Major Peter Strzok, chairman of the military science department said, to test under stress the thoroughness of the cadets' application of the medical treatment procedures."

Several simulated casualties were stretched out with foam rubber wounds, rubber face masks exhibiting the proper symptoms, and a verbal story line of how it happened.

Teams of cadets were expected to apply the proper first aid measures.

One of them looked anxiously at an Evening News photographer teetering on a chair with his camera. There seemed a possibility that they might have a real victim to work on.

Participants included teams from Northern Michigan University, Michigan Technological University, Central Michigan University, the University of Detroit, Western Michigan University, and the University of Wisconsin at Oshkosh.

LSSC cadets serve as the "aggressor enemy" in the field exercises, harassing the teams in a wide-range sort of chess game. One division head, who preferred to remain anonymous, volunteered to join the enemy.

Cadets assemble Saturday for a critique and steak fry — they will have existed on two candy bars and a canteen of water since the previous Friday evening. Major General J. H. Chiles, deputy commander of the Fifth Army, will be on hand to observe the exercise.

Planning for the meet has been underway since early 1969. "It's been a big job for the detachment," Major Strzok said. "but it is a fine opportunity for these young men to test their physical fitness and alertness as well as the effectiveness of their photographer teetering on a the past months."

The cadets were welcomed to campus Friday morning by Dr. Kenneth J. Shouldice, LSSC president, who said that "the College is proud to support the ROTC unit on campus and regards it as an important element of the academic and co-curricular structure.

"The ROTC is a voluntary program at LSSC" Dr. Shouldice said. "We have some fine cadets enrolled; and we are proud of them."

1978 (July) - to 1979 (Feb 6) : Works in Iran as a "Support Unit Manager" with Bell-Textron during the height of the Iranian Revolution

Bell-Textron's is *"a firm which sold and services 2,000 helicopters for the Iranian government"*. See [HN00GW][GDrive] .

Peter Strzok II's role at Bell-Textron was terminated when he left Iran (at some time before February 1979), making his employment in Iran with Bell-Textron only a half-year tenure. See [HN00GW][GDrive].

Note these dates, and compare to the Iranian Revolution (Wikipedia : https://en.wikipedia.org/wiki/Iranian_Revolution#Rise_and_exile_of_Ayatollah_Khomeini) . It was from "January 1978 – 11 February 1979". It is almost as if Peter Paul Strzok I went to Iran and worked at Bell-Textron as Iran during the same August 1978 to December 1978 time that *"strikes and demonstrations paralyzed the country"*.

*"Demonstrations against the Shah commenced in October 1977, developing into a campaign of civil resistance that included both secular and religious elements, and which intensified in January 1978. **Between August and December 1978, strikes and demonstrations paralyzed the country.. The Shah left Iran for exile on 16 January 1979,** as the last Persian monarch, leaving his duties to a regency council and Shapour Bakhtiar who was an opposition-based prime minister. Ayatollah Khomeini was invited back to Iran by the government, and returned to Tehran to a greeting by several million Iranians. The royal reign collapsed shortly after on 11 February when guerrillas and rebel troops overwhelmed troops loyal to the Shah in armed street fighting, bringing Khomeini to official power."*

Gilman native says individual Americans treated well in Iran

By Arnie Hoffman
Regional editor

America as a country is despised because it was seen as a supporter of the Shah of Iran, but individual Americans were treated well in respect to the crisis in Iran according to a former Gilman area man who left that Asian nation Feb. 6.

Peter Strzok

Peter P. Strzok, 43, son of Mr. and Mrs. Mike Strzok, now living in Eau Claire, said he hopes the government of Ayatollah Ruhollah Khomeini will stabilize the country.

"I'd like very much to go back to Iran," said Strzok, who spent two terms of military service and seven months as a civilian in the country.

On the issue of treatment of Americans in Iran, Strzok, who was a support unit manager for Bell Helicopter Inc., said, the resentment of America was because Iranians linked the U.S. involved with the shah. "Recently when Iranians saw Americans they would yell 'death to the shah' at them," he said.

No physical violence

Strzok said, "individually, Americans did not suffer any physical violence at the hands of the Iranians. He said two American officials had been killd and one of the deaths may have come in a robbery rather than an assassination.

"When you have a country where hundreds were killed and only two Americans out of the thousands in that country were slain, you can't make a case of physical violence against Americans," he said.

He noted even in the attack on the American embassy there were no Americans killed.

He said there were as many as 45,000 Americans working in Iran as late as last October and with the dependents that number may have been as many as 70,000.

Strzok said it was a combination of several groups that brought about the downfall of the shah. He said he hoped Khomeini would be able to unite those factions and form a stable government. He saids he expected the United States to have a good relationship with the new government because the country needs America's technology.

Needs unification

"Uniting the factions is going to be a major problem," he said, "they all joined together to oppose the shah and some of them may want to go in a different direction."

Strzok said the Communist element is strong in Iran not so much because of numbers but because the Communists are extremely well organized and everthing they do has a purpose. He said some of the problems which seem to exist are not neccesarily the doings of Khomeini supportors but rather separate groups including the one which attacked the U.S. embassy.

He said from his observations the high school students who blocked the streets and yelled the chants were not the ones leading the overthrow of the shah.

He said the workers in downtown Tehran were the ones who brought about the revolution. "The shah's government was very corrupt," Strzok said, "and it got to the point where the workers could not tolerate it any longer because many of the promises of housing, jobs and better living conditions never came about."

Reached a point

"It got to the point where the shah had to go and the people learned how much money some of his top government officials were taking out of the contry to he added.

Strzok said he sensed a change was in the making when he returned to Iran last July after retiring as a Lt. Col. with the U.S. Army Corps of Engineers.

"It was the first time I had heard the working people speaking out openly and criticizing the shah and the corruption in the government," he said.

"It was a consensus sort of thing," he added.

The situation deteriorated to a point, he said, that it was announced in December that the American school at Tehran would not reoen in January and would be closed until the following fall. After the announcement, Strzok's wife and eight-year-old son, Peter, returned to the U.S. Jan. 6.

Large U.S. school

The school, Strzok said, had 3,500 students and was the largest American school outside of the states. His wife was a teacher there.

Strzok, who was working for a firm which sold and serviced 2,000 helicopters for the Iranian government, said he feels Iran has some strong points which may enable the Khomeini government to survive. The major one being that there is a stronger element of management now than ever before. On the negative side, he said the factions within the country, based on economic, religious, ethnic and tribal differences, could create problems.

Strzok said he enjoyed living in Iran as did most Amercians in the country and that he'd like to go back. "It is a beautiful country; the only regret I had was that since July, with the marshall law, that we didn't have the opportunity to travel about more.

Strzok, whose job with Bell-Textron was terminated when he left Iran, is already making plans to fly to Saudi Arabia early next week to check on a new job with a construction enterprise.

(See full page in newspaper at [HN00GX][GDrive])

Peter P. Strzok

State native finds his niche in relief work

By LISA FOTH
Of the Press-Gazette

Peter P. Strzok, a native of Gilman, Wis., has seen international cooperation succeed in his work as program director for the Catholic Relief Services in Upper Volta.

Strzok, 45, moved from job to job for two years after retiring as a lieutenant colonel in the U.S. Army and in 1980 found his home in Upper Volta, the fifth-poorest country in the world, according to the United Nations.

Upper Volta is located in west Africa and is bordered on the north by the Sahara Desert and on the south by the Ivory Coast. Catholic Relief Services began its work there in 1960 and has provided financial, educational and medical aid with the help of the U.S. government.

"The big bucks were there," Strzok said about his last job before joining Catholic Relief Services. "But working with greedy people warps your mind."

So when the opportunity came to continue working in foreign countries — as he did during his 21-year stint with the Army — Strzok moved his family to what he calls "a very open and friendly country."

Catholic Relief Services is the largest volunteer agency in Upper Volta and works closely with the U.S. Agency for International Development, the many other nations that provide assistance to the country, and other volunteer organizations.

"It's a pretty well-integrated development program," Strzok said about the cooperation between nations and other agencies. "The program is working reasonably well."

Up to 98 percent of the food intended for distribution reaches its final target. And Strzok feels that is successful, compared with the 50 percent rate in some African nations.

One problem the people of the country face is the lack of a distribution system for the foods they produce.

The Catholic Relief Services focus the majority of their assistance on the infants and mothers of the country. More than 28,000 tons of food is distributed throughout the country each year in hopes of decreasing the 35 percent mortality rate among children up to 3 years old.

Pure water, however, is the biggest health problem for the country Strzok said. And one of his goals is to provide portable water sources.

While that would greatly decrease the high mortality rate among children, Strozek realizes it would also increase the population significantly.

"But we'll worry about that when we reduce the mortality rate of the kids," he said.

Another key to the success of the aid agencies in Upper Volta is the close-knit family situation of the country.

"They're some of the most honest and open people I've ever known," Strzok said. "It's a special country."

[HN00GY][GDrive]

1981 (Aug)

(See full page in newspaper at [HN00GZ][GDrive])

Catholic Relief battles Upper Volta famine

Thirty-five of every 100 children in Upper Volta fail to reach age 7.

They are victims of malnutrition and disease in a west African country that is listed by the United Nations as the continent's poorest.

Ninety percent of Upper Volta's 7 million people work at subsistence farming and live in grinding poverty.

The average yearly income in 1978 was $125.

Peter Strzok, a Wisconsin native, works to save lives in Upper Volta as program director for Catholic Relief Services there.

His agency in the past year distributed 25,000 tons of food valued at $30 million to the hungry of Upper Volta.

The food, provided by the Agency for International Development through the Food for Peace program, includes dried milk, cornmeal, soybean oil and rice.

"We feed them food which is indigenous to their country so they don't build up a liking for food that cannot be raised in their own country," he said an interview.

Strzok, who was in the Twin Cities this week while on a month's leave from his job, said the message he wanted to bring to Roman Catholics and other taxpayers was that his aid program really works, with 98 percent of the food received going to the intended recipients.

Strzok

It's a multi-faceted program geared largely to "nutrition intervention," he said. Mothers are encouraged to bring in their children for weighing so their nutritional status can be monitored. If it is bad, they get more assistance.

Families also are instructed in the use of local vegetables and products and in health care.

"The biggest health problem is the lack of drinkable water," Strzok said. "Children get diarrhea and become dehydrated and then vulnerable to other childhood diseases that are endemic there—measles, malaria, meningitis, cholera, tetanus, typhoid and hepatitis.

"With one doctor for 70,000 people, health care is minimal. The situation is very grim."

Catholic Relief Services works with other voluntary agencies in Upper Volta to prevent duplication of effort and to make sure that available resources are applied most efficiently, he said.

In answer to a question, Strzok said if the Reagan administration had understood how infant formula is promoted in Third World countries such as Upper Volta, it would not have cast the only vote in the World Health Organization against a voluntary marketing code.

Most African women cannot afford to buy the formula and the water available for mixing with it causes diarrhea, he said.

Strzok, 45, served 21 years in the U.S. Army Corps of Engineers before retiring with the rank of lieutenant colonel. He spent much of his Army service in development work in Iran, Saudi Arabia, Vietnam, the Philippines and Korea.

He said he finds his work in Upper Volta to be "enjoyable, gratifying and fulfilling."

He and his wife and their 11-year-old son will return to Africa late this month.

Per capita income in Africa's Upper Volta is $125 yearly

By Lynn Meyer
Leader-Telegram staff

While some American women might feel like martyrs if their washing machine breaks down one week and their dryer the next, many women in the Upper Volta of Africa may walk 10 miles to get the water they need for one day and then carry it back home.

"It's rough...very primitive," said Peter Strzok of life in the Upper Volta of Africa. Strzok, a former U.S. Army engineer, is director of a $25 million program, sponsored by Catholic Relief Services there. He and his wife and son have lived in Africa for three years. Strzok is a native of Gilman, and his parents, Michael and Josephine Strzok, reside in Eau Claire.

Upper Volta, according to Strzok, is about the size of Minnesota and has a population of 7 million people. The area is next to the Sahara Desert and is landlocked. There are no natural resources except the poeple, Strzok said. "It is the poorest country in Africa," he added, "per capita income is about $125 per year."

Catholic Relief Services, an overseas development agency for the American Catholic Church, is in Upper Volta (among many other places) attempting to help the people there.

Three on-going programs

"We have three programs in Upper Volta," Strzok said. One is a nutrition intervention program for pre-school children and their mothers. "We are trying to raise the nutrition standards of mothers, children and pregnant women," Strzok said. "This is our first priority group." He said that in Upper Volta, 35 percent of the children die before they reach 15 because they are so susceptible to disease. "This death rate is just unacceptable, anyplace in the world," he said. The people are subject to all kinds of diseases like typhoid, polio, leprosy, malaria, cholera and meningitis and are too malnourished to fight them. There is also the fact, Strzok said, that disease is largely uncontrolled because of lack of medical facilities. "There is one doctor per 70,000 people," Strzok reported.

The second target group of the agency is primary age school children. "We give a school lunch to all children in elementary school," he said, adding that in Upper Volta, only one out of eight children is able to go to school, simply because there aren't enough schools, The goverment is too poor to provide them. "We are feeding 250,000 school children each day," Strzok said, "and we cooperate with their government to help build schools."

Food for work

The third area in which the agency works is on community projects. The agency provides food for people who provide their time to build community facilities.

"The food comes from the U.S. government as part of the Food for Peace program," Strzok explained. He said that the U.S. government will supply the food because Catholic Relief Services is more easily able to distribute it and at a far smaller cost. Also, the agency is not a missionary program. People of all denominations are employed by the agency which distributes about 25,000 tons of food a year, most of which comes from the Midwest.

The next part of the program in helping the people, after feeding them, is educating them, according to Strzok. Ideally, the people of Upper Volta would someday be able to help themselves and become more of a developed area. "But Upper Volta is one of those countries where it's hard to foresee them ever getting out," Strzok said. There simply are no resources, and there and no work. Strzok said that gas is $4 a gallon and that rising energy costs are making it increasingly difficult.

But the people are hard working and are trying hard to reciprocate for the aid they are getting, Strzok said. "It's not a case of give me, give me, give me.

"They are wonderful, hard-working people with strong family values... they have made us feel like guests in their country..." He said it is not that they are not willing to work, it is just that there is very little work to be had.

From what Strzok reported, it doesn't look good that Upper Volta will ever be a very productive, self-supporting country.

And yet, as Strzok said, "you can't just ignore their existence." People who have been overseas, who have seen the people, realize the need to help them. After seeing starving children, "you can't be apathetic," he said, noting that Americans just happened to be lucky in being born in the United States.

"I really believe the world has to address the problem of developing countries," he said, "they are always going to be with us."

In a country where 40 out of 100 children die, they need help. It's not something people get used to, their children dying. "A mother's grief is no less," he said.

Poor sister

Tiny nation a 'basket case' Catholic worker assesses

By JOEL RUTCHICK
Times Staff Writer

Being left alone is devastating for an anonymous African nation with an unfamiliar name and without the resources to fend for itself.

That is where the job begins for Peter Strzok, whose assignment as director of Catholic Relief Services in Upper Volta is to harness outside resources to improve lives in the Colorado-sized country south of the Sahara Desert in West Africa.

"No matter how valiant and courageous, they are a basket case in the brotherhood of man," Strzok said of the people he knows of as the Voltaics.

All indicators suggest the plight of Upper Volta looms much worse by the year 2000, he said.

Yet Strzok points to statistics showing that Upper Volta already ranks pretty high on the misery index — the world's second highest illiteracy rate, a life expectancy of 42 years, an average per capita income of $150 a year and overall standing as the world's third or fourth poorest nation.

"This is, I think, a solvable problem if you devote the resources to it," said Strzok, whose name is pronounced Struck.

A native of a dairy farming area in northwestern Wisconsin, and a graduate of Marquette University, Strzok visited the St. Cloud area this week to enroll his 12-year-old son, Peter Jr., at St. John's Preparatory School.

Coming to Upper Volta's capital Ouagadougou about three years ago marked the beginning of the 46-year-old Strzok's third career.

He spent 21 years with the U.S. Army Corps of Engineers until his retirement in 1978. He worked two years in the private sector before his appointment with the organization that is part of the United States Catholic Conference.

His earlier jobs also entailed considerable travel — the Middle East and Vietnam, for instance.

As for excitement, he heard nightly riots and screaming, watched banks burn in downtown Tehran and did not leave Iran until Ayatollah Khomeini ascended to power in 1979.

"I'm enjoying this job more because it's more fulfilling," Strzok said.

His organization helps those who are most in need, Strzok said, and he finds the receptivity of the Voltaics particularly gratifying.

"There are countries in Africa where I would not want to work because it's so darn difficult," he said. "I think there's an extreme amount of goodwill through Upper Volta."

The residents are "straight with you" and the atmosphere is influenced less by politics, he said.

Catholic Relief Services receives its operating budget from Roman Catholics in this country and gets its project funds from a variety of sources, including the governments of the United States, Canada, and France and United Nations organizations, he said.

The organization works in 70 countries, 23 of them in the sub-Saharan region of Africa. Upper Volta trails only India and Egypt in the size of Catholic Relief Services programs and received $30 million in assistance from the organization in 1981, Strzok said.

Although his organization is in the country at the invitation of the Catholic Church of Upper Volta, programs reach the neediest segment of the population, regardless of religion, he said.

"Our food is not used for proselyting," he concluded.

Probably the most important aspect of Catholic Relief Services' presence is the mother-child program, designed to curb infant malnutrition.

"About 30 out of 100 children die before they reach the age of 3," Strzok said. Sixty percent of children 3 years old or under suffer from severe malnutrition, he added.

Two other components of Catholic Relief Services work are its school lunch and food for work programs.

Akin to the Work Projects Administration of Depression-era America, the food for work program gives Upper Volta's men meaningful employment on road construction, water projects and other public improvements, he said. Because there is no agricultural work from December to June, these men would not have other work during that time.

Upper Volta has few good roads, a water shortage and almost no industry. The country generates less than 50 percent of what its people need to survive and there are "no natural resources except their people," Strzok said.

Of Upper Volta's 6 million people, roughly 5.5 million of them work as subsistence farmers.

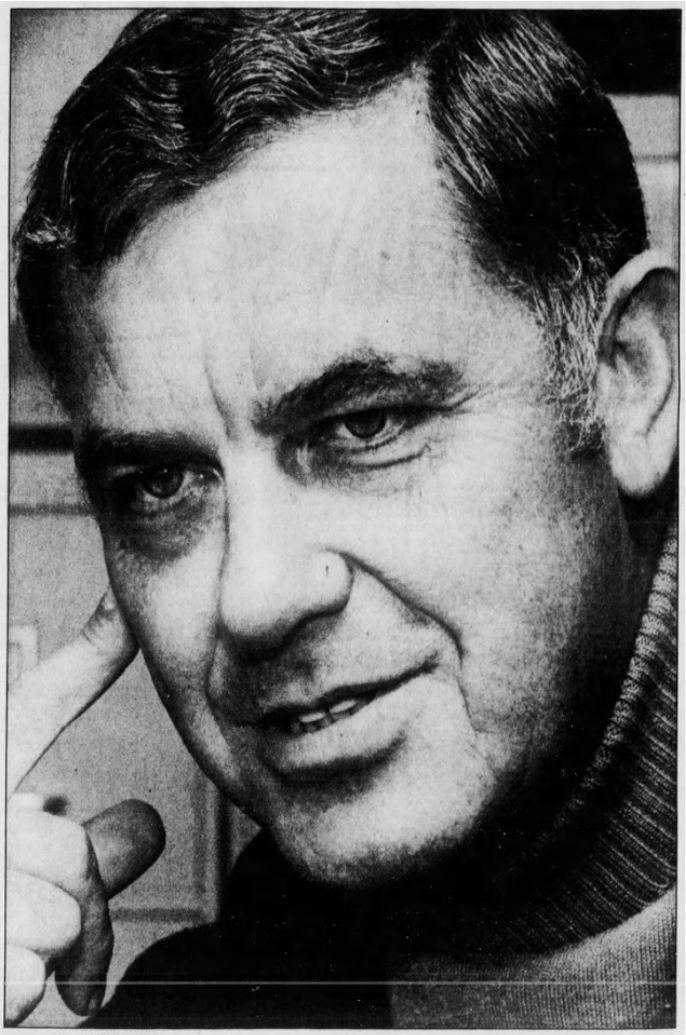
But the country faces tough agricultural conditions because its most densely populated area is characterized by very poor soil, erratic rainfall and a treeless plain or savannah.

The southwestern and south-central portion of Upper Volta is sparsely populated, even though it has the country's most fertile land. It will remain that way unless a campaign is successful to eradicate a disease that can lead to blindness. A fly found in that part of the country causes that disease, known as onchocerciasis.

Upper Volta gained independence in 1960 as part of France's policy to give up its colonies in old French West Africa.

But the French-speaking country is probably worse off today than 20 years ago, which has led to Strzok assessing his organization's impact and other help in more realistic terms.

When he started in 1980, he thought, "Boy we can do this, this, this. But you don't know that you can't do it."



Times photo by Steve Wolt

The misery of Upper Volta can be solved if enough resources are devoted to the problem, says Peter Strzok, director of Catholic Relief Services in the African nation.

Army-to-Africa move gratifying

By William R. Wineke
Religion reporter

One might expect that, after 21 years in the Army, Peter Strzok would want to retire to a soft job someplace in the South and start making money.

Instead, Strzok (he pronounces his name "struck") moved his family to Upper Volta, an almost barren nation in Africa, where he is program director for Catholic Relief Services.

"I've rarely had a job where I've been so challenged and I've never had a job where I've been so gratified," Strzok said during a visit to Madison this week.

Upper Volta, a part of the old French West Africa, is bounded by the Sahara Desert. The country is the size of Minnesota and is home to 7 million people, more than 90 percent of whom are subsistence farmers.

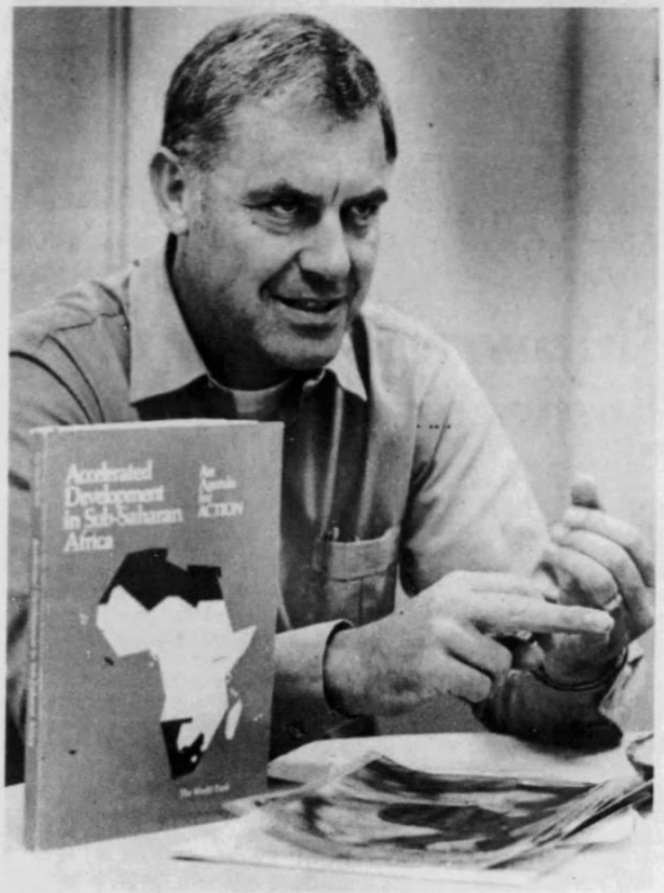
The program Strzok directs helps teach young farmers more effective farming techniques, provides school lunches to 250,000 children each day and is helping farmers learn to plant "oil seeds," like peanuts, which can be used for a cash crop and also for personal nutrition.

Catholic Relief Services is the largest single social assistance program in Upper Volta, Strzok said. It has an annual budget of $30 million and serves about 500,000 people a year.

Most of the program funds come through the U.S. Food for Peace program. American Catholics contribute about $500,000 annual to the Upper Volta program.

He said working with the residents of Upper Volta is rewarding and saddening.

"The reality of Upper Volta is that the people are worse off in 1982 than they were in 1960 and in the year 2000 they will be worse off than they are now," Strzok said.



Peter Strzok details problems of Upper Volta.

— State Journal photo by Joseph W. Jackson III

"Upper Volta is one of the three poorest nations in Africa and one of the five poorest nations in the world."

It is a nation where people are not only poor but are also hungry, Strzok added.

"We distribute 20,000 tons of American food each year and I can say with assurance that 98 percent of that food gets to the proper places," Strzok said.

Strzok said change in Upper Volta won't come quickly.

"Fundamental cultural change doesn't take years; it takes generations," Strzok said.

"The farmers here have been farming one way for more than 800 years and they aren't going to start farming another way just because an American comes in and tells them to do so."

Strzok also suggested that change in agriculture must be integrated with other changes in an economic system.

"You can't tell a farmer to go into debt to purchase a machine that will make him more productive unless you can also assure him that he will have adequate time to repay the debt. Otherwise, he might go into debt this year and face a drought next year. Unless he has a long-term commitment, he could be wiped out by the drought and end up worse than he began."

Strzok, a native of the Eau Claire area, grew up on a dairy farm and spent 21 years with the Army Corps of Engineers before joining Catholic Relief Services three years ago.

He said he finds motivation in his work in Upper Volta, partially because he can see the projects his staff supports do good and partially because the country is relatively free of graft.

"You don't see much corruption. I think that is because the economy is so very fragile that people understand that graft and corruption would tip the balance and everything would go down the tubes," Strzok said.

Grant's grandson dies

ESCONDIDO, Calif. (AP) — Chapman Grant, 95, historian, zoologist, publisher and grandson of former President Ulysses S. Grant, died last weekend in a nursing home. He was the son of Jesse Grant, the president's youngest son.

Relief services director en route to Haiti

While Peter Strzok was with the U.S. Army Corps of Engineers, he worked with the governments of underdeveloped nations.

Following his retirement, he began working with Catholic Relief Services, this time dealing directly with the struggling farm families in the impoverished African nation of Upper Volta.

Strzok has just completed a three year term in Upper Volta.

His next assignment is director of Catholic Relief Services in Haiti.

One goal of the service is to reduce the infant mortality rate — about 22 percent in Haiti.

As necessary as that goal is, it poses another problem. "What does reduction of the infant mortality rate do to social systems 10 years down the line?" Strzok asks.

HE DOESN'T have the answer, but believes there must be a solution. "It's a hard job to come up with a model effective over time," he said.

Catholic Relief Services is an overseas assistance and development program of the United States Roman Catholic Church. Most of Strzok's work involves food assistance.

Peter Strzok

He was in Bismarck Wednesday while traveling through North Dakota on his vacation between assignments.

The food assistance program Strzok worked with the last three years involved 150,000 children and mothers.

Once a month the child was weighed and checked for health problems, while the mothers participated in a nutrition education discussion.

THEY WERE taught how to properly nourish their children with the staples available to them — dry milk, vegetable oil and corn meal.

"It's interesting work but it's discouraging. You're lucky if you hold your own," Strzok said.

The food assistance work is short term. The long-range goal — Strzok calls it a challenge to the world — is to make the country self-sufficient and productive.

Changes Strzok and his colleagues implement come slowly.

Change is delayed further because each idea must be explained to the people and adapted to their culture.

"You have to be sensitive to the whole thing," Strzok said. "You have to work in terms of generations."

THE WISCONSIN native is married and has a 13-year-old son. He said his family has a good attitude about the lifestyle, but every now and then his son wishes for a television video game.

Strzok said his value system changed when he moved to Upper Volta. "You don't have all the choices," he said.

There's no question about what televison station to watch or which career to pursue. Rather, the people spend their time working to survive.

"It's not less interesting," he said, "just different."

Dispute arises over Catholic agency's famine work

By RALPH BLUMENTHAL

© 1985 New York Times

NEW YORK, N.Y. — The spending of money collected for Ethiopian famine victims has become the center of a dispute involving Catholic Relief Services, the largest private charity operating in Ethiopia.

A former representative of the agency, an arm of the U.S. Roman Catholic Church, has complained in letters to church hierarchy and public officials that the agency misled donors and failed to properly spend money collected since last October for the drought-stricken African country.

The former representative, James MacGuire, and other past and present employees assert that the food distribution program has been hampered by several problems, including a dispute with the U.S. government, which supplies the food, over who is supposed to pay for transportation of supplies in Ethiopia.

Officials from the relief agency, the largest charity distributing U.S. government food in Ethiopia, acknowledge some problems in spending money collected in a well publicized fund-raising drive that began in October. But they say the money will eventually be used for projects to alleviate famine in Africa.

According to the Catholic Relief Services' own figures, the agency has so far spent less than $9 million of the $50 million in emergency aid collected from the public since October.

The agency also says it has distributed less than 90,000 tons of food in Ethiopia so far this year, short of the projected 140,000 tons.

A Separate Issue

In a separate issue, former and present employees have questioned the agency's use of money collected from aid recipients in Ethiopia and elsewhere that is supposed to be earmarked for food projects benefiting the contributors.

Agency records suggest that such money was sometimes lent or applied to other agency programs and expenses in what the critics assert were improper dealings.

Herbert Beckington, the inspector-general of the U.S. Agency for International Development (AID), said last week that he was reviewing material regarding "certain allegations concerning CRS operations." He said he was "not conducting an audit or investigation" but declined to give further details.

Lawrence Pezzullo, executive director of CRS, which is based in New York, said "we agree there's a disagreement" with the government agency but defended his organization's record in distributing food to more than 1 million starving Ethiopians. He termed the allegations of misused money "scurrilous" and blamed "disgruntled" former employees for raising them. "Our record is excellent," said Pezzullo.

Those Who Complained

Those who have raised the complaints include three former employees: MacGuire, who is a former Peace Corps worker and Catholic Relief Services representative in Burundi, and who is now director of corporate development for Macmillan Inc.; Peter Strzok, a former Army Corps of Engineers officer who served with the Catholic agency in Africa and Haiti; and Jean Serge Picard, who served in Zaire and Burundi.

Also interviewed was Norbert Clement, who worked for the relief agency for 25 years in Rwanda, Ethiopia and Haiti. He is still an employee of the agency but is on leave.

Catholic Relief Services was founded in 1943 and, with an annual budget of $430 million, has operations in 70 countries.

Agency officials said last week that while little of the $50 million in donations had been spent so far, the service had still aided 1.8 million Ethiopian famine victims.

William Schaufele, director of the agency's African operations, said $8,141,000 had been spent so far and $22,890,000 had been "allocated" to Ethiopian projects and would be spent by the end of next year. The remaining $20 million, the agency previously announced, will finance long-term development projects in the rest of Africa.

Other 'Problem Nations'

Pezzullo said the agency had decided that apart from Ethiopia "there are 17 more problem countries" in Africa. Asked whether the money had been deposited in a bank, he said it had and added: "What the money is doing now is irrelevant. The important thing is it will be spent over the next 10 to 15 years."

Of other agencies getting contributions for Ethiopian aid, World Vision International said it had spent nearly $20 million of $24 million in donations; Save the Children, $3.6 million of $4.5 million; Lutheran World Relief, $3.1 million of $5.2 million; and CARE, $2.1 million of $5 million.

Information sheets used by Catholic Relief Services workers who take calls from donors say "100 percent of the money we collect for Ethiopia is used in Ethiopia to transport food from the ports, by plane, truck and train and distribute it to about 1 million people in distribution centers."

Another said: "Donations will be used to transport more food from the ports to the people. One hundred percent of their donation will be used for the relief. We have a very low overhead."

Agency documents show the $8.1 million spent included $1.8 million for categories listed as "administration," "direct program support" and "overhead, consultations, etc." at Catholic Relief Services offices in New York, Geneva and Nairobi, Kenya. Pezzullo said the money was for direct support of the Ethiopian aid effort.

First 7 Months of 1985

Figures provided by the agency show that it has distributed about 87,000 tons of food in the first seven months of 1985, less than the expected 20,000 tons a month, or 140,000 tons by now.

"We probably overestimated the amount of food we could get through the pipeline," Pezzullo said.

John Donnelly, another agency official, blamed Ethiopian "bottlenecks," for the shortfall, including a lack of trucks and the problem of moving goods through a poor, Marxist country that is fighting a war against rebels.

At the same time, the agency and other charities have been arguing with AID over the federal agency's recent insistence that the organizations pay half the cost of inland transport, an expense customarily absorbed by the host nation or the United States.

On May 24, Pezzullo wrote to M. Peter McPherson, administrator of AID, warning that the dispute could hold up deliveries to Eritrea province, one of the hardest-hit sections of Ethiopia.

"Before embarking on a program which would bring food to an additional 40,000 families in Eritrea," Pezzullo wrote, "we require a commitment from AID to provide food and funds from land transport and local administrative costs."

Despite Ample Funds

Puzzullo said his agency later agreed to pay half the inland transport costs after AID agreed to similarly finance relief service projects in Ethiopia.

But MacGuire contended that AID and the Catholic agency "have permitted hundreds of thousands to die whilst, despite ample funds available, they squabbled over who would pay for what in Ethiopia."

The former staff members have also criticized the relief agency on an entirely separate issue, the agency's collection and use of money contributed by poor aid recipients.

Federal law governing the distribution of free government food permits relief groups to ask those receiving the aid for nominal contributions, based on their ability to pay. But the money must be held for the benefit of the contributors.

Catholic Relief Services collects about $6 million a year in this way.

Picard said that in 1983 he refused a superior's directive to transfer $200,000 in such contributions out of Burundi, where they had been collected, to Nairobi. He also contended that such money supposedly earmarked for the poor from whom it came was often applied to unrelated agency expenses.

Another former employee, Strzok, recently wrote the agency that while he served in Upper Volta, now Burkina Faso, he was told to use money from aid recipients to meet overhead.

And Clement, now on leave in Paris, said he had been told to use similar money to defray administrative expenses in Senegal but that he had resisted.

AID has been trying for several years to audit how that money is spent to ensure compliance with government provisions. But the Catholic agency has refused to allow the audits, contending that the money is unrelated.

Commentary

Plague of locusts – and of bunglers in international relief

By Peter Strzok

"Watch out for the crickets!" said the headline on an April 1986 editorial in Afrique Agriculture, a Paris periodical. Describing the return of the crickets, the magazine spoke of clouds of flying locusts (the adult stage of the crickets), each cloud weighing 100 tons, moving 40 miles per day and consuming half its weight in vegetation per day. As an adult, the female locust lays 200 eggs per day for about a month. A swarm may consume 1,500 tons of vegetation and lay trillions of eggs during its 30-day life.

A witness to such an attack years ago in northern Ghana described the event: "The sky is blackened out. A great sound of beating wings is everywhere. The plume of the swarm is 12 miles long, 4 miles wide. It descends on a village, inundating it with an 8-foot flood of swarming, eating insects which devour all vegetation available. Women battle to protect their children. Humans and animals alike are terrorized. Suddenly, the swarm moves and is gone. Shock and disbelief remain, along with the denuded field and trees. Another chapter to the African folklore of devastation is made."

During the last three weeks in September, I visited the Ivory Coast, Mali, Burkina Faso, Senegal and Gambia to see the condition of the crops, the effects of the locusts and measures underway to contain the infestation. The trip went from the rain forests in the south to the southern edges of the Sahara in Mali. Everywhere the land is lush and herds are robust. Rainfall this year is twice normal.

But in the Sahel, there is always a dark side. The moisture has caused an eruption of harmful insects, of which the locust is only one. Aphids infest the peanuts; blister beetles attack the maturing millet, sucking the milky kernels dry.

In early 1986, the U.N. Food and Agriculture Organization (FAO) warned of grasshopper and locust infestation across the Sahelian zone — from Mauritania and Senegal through Mali, Burkina Faso, Niger, Chad, the Sudan and Ethiopia — a belt 5,000 miles long and 500 miles deep. Two and a half million square miles in Africa's most productive region for cereals, cotton and cattle are at risk.

Donor agencies and regional organizations in Africa responded. In mid-August, after a direct appeal from President Diof of Senegal to Peter McPherson, head of the U.S. Agency for International Development (AID), a team of experts from the United States went to Senegal. Their story is one of strong host-government cooperation, superior data collection on infestation, effective spraying and breakthrough techniques to get the treatment to the locations of greatest need on time and on target.

But this effort may be in vain because of the lack of cooperation by international partners. That is a story of frustration, bungling and inactivity. The result may well be reinfestation and catastrophic destruction of vegetation in the next two to six weeks as the crickets mature into flying locusts and begin their pilgrimage of consumption, egg-laying and destruction across the Sahel. Not yet added to the equation are the deterioration of rural agriculture, human suffering and the costs of emergency food aid.

The U.S. team worked with Senegalese government and local AID technicians who helped get a quick fix on the problem. Using helicopters from the Senegalese Army because of impassable roads from heavy rains, the team plotted the infestation in a wide belt in central Senegal. The crickets were moving south toward Gambia and fanning out east and west. Subsequent infestations were located along the Senegalese border with Mauritania and in north central Senegal.

Five DC7 aircraft used for spraying in Sheridan, Wyo., went to Dakar, along with three loads of insecticides and equipment. Spraying began in late August.

The DC7s flew their missions out of Dakar airport, each carrying 3,000 gallons of insecticide solution and able to ferry its load 500 miles before beginning systematic swath spraying over the infested areas. The insecticide was Malathion in the same concentration used in the United States, with negligible risk to warmblooded animals. Malathion's effects on crickets are immediate and deadly. It also kills other insects such as aphids and blister beetles.

The teams worked from daylight to sunset until the end of September. The infestations were controlled in a vast, 22,000-mile-square region.

Adjacent areas were another matter. FAO is coordinating the African response from a special office in Rome. An African antilocust organization had two small aircraft in Senegal. Neither had operated for two years, but the U.S. government provided the necessary spare parts. In late September, a Cessna was flying, piloted by a French woman competent in small aircraft but with no spraying experience.

FAO reported spray swaths of 1.5 kilometers wide, which the U.S. team considered completely beyond the capabilities of the aircraft. I observed the plane spraying at an altitude of 600 to 800 feet. Dick Dyer, a U.S. Agriculture Department pilot with 35 years' experience in locust control, said spraying should be done at 250 feet.

As a result, the FAO effort was ineffective and its reports that infestations are being controlled are inaccurate.

In Mauritania, the U.S. team attempted to obtain information on infestation in areas adjacent to their work in Senegal. The FAO office in Dakar did not have current data. Similarly, officials in Western Mali lacked information about the extent and location of infestation. According to the U.S. team, the French government made commitments for assistance but contributed little.

A Canadian control effort in Burkina Faso is apparently having a positive impact. The Canadian program in Senegal is growing as well; on Sept. 26, as the U.S. effort was winding down, four spray aircraft from the Canadian government arrived to begin the third phase of locust control.

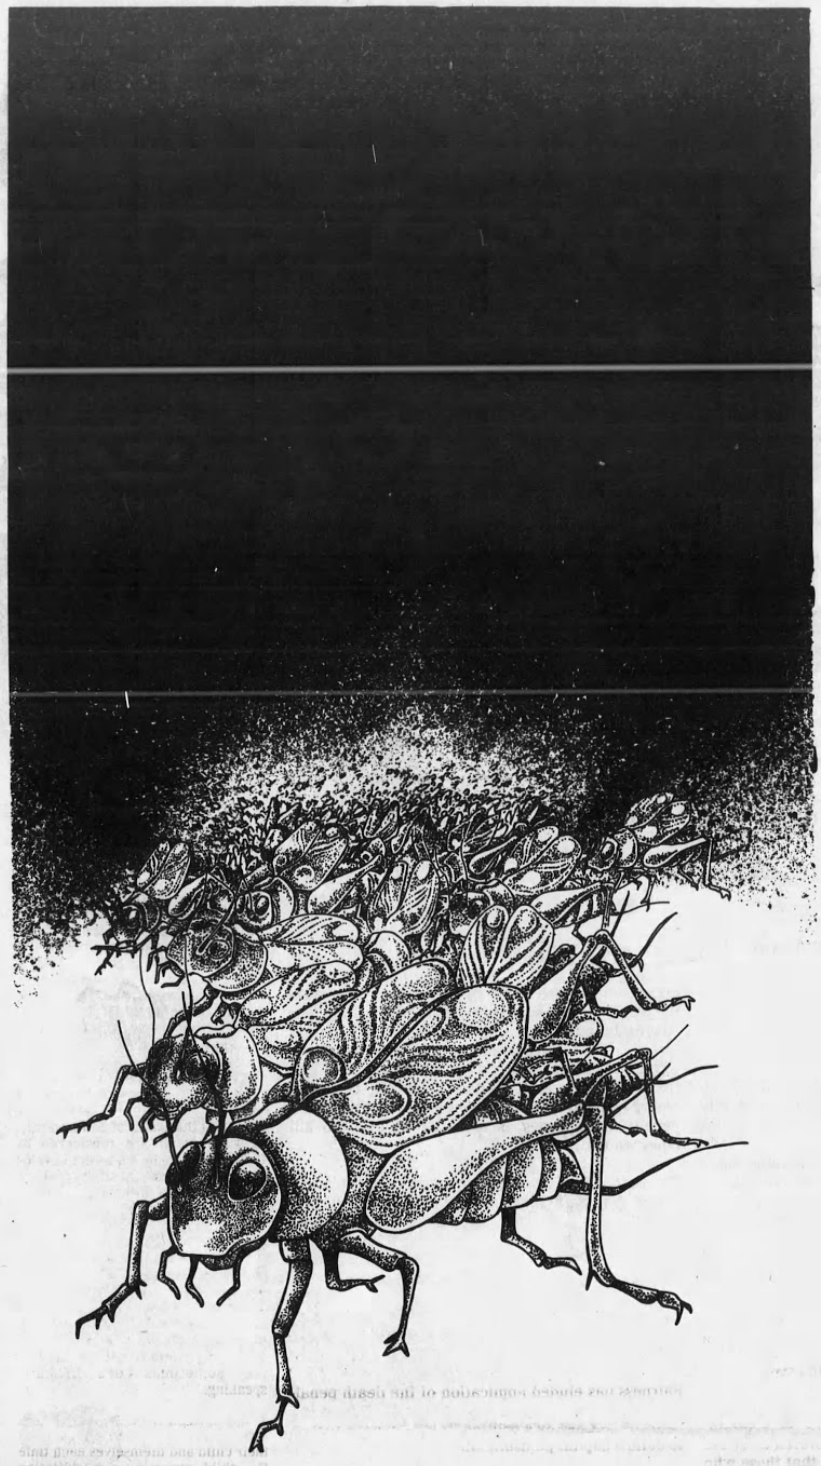

Illustration by Craig MacIntosh

But the threat remains. The U.S. team, which debriefed USDA and AID officials in Washington last month, fears reinfestation when the locusts mature and begin flying in two or three weeks. Next year, the problems throughout the Sahel may be more severe as the larvae hatch from the first rains in May through October. That allows time for seven or eight cycles of locusts to multiply in geometric proportions. Unless strong planning and control begin now, "there is nothing which can prevent such a disaster," according to the U.S. team chief.

On Sept. 26 I talked to Alioune NDiaye, director of the FAO locust program in Dakar, about follow-up initiatives for 1987. He spoke of organizing a conference in Dakar in late October at which nongovernment agencies would be asked to teach villagers how to control the problem. He gave two examples: having the villagers plow their fields with hoes to a depth of 2 or 3 inches, exposing the locust larvae to the sun, and teaching them to make a broth from the leaves of the Neem tree, which is a natural insecticide, to spray next year on the hatching larvae.

Both of these are important, local techniques with almost no undesirable ecological side effects. But in the sparsely populated grasslands stretching from Mauritania and Senegal to the Sudan, who is going to treat the land where larvae wait by the billions to hatch at the first great rain?

Other troubling questions remain unanswered. Why wasn't the joint response, with the FAO lead, more effective? Will the next several weeks bring catastrophic damage to crops that could have been easily and cheaply protected? Given the predictions of even greater problems in 1987, what international measures are necessary?

The countries of the Sahel remain hostage to events they cannot control. Assistance from donors is of marginal benefit because of lack of cooperation. To the people of the Sahel, such poor performance only adds to their distress. Their fragile government structures, limited financial resources, low level of education, poor infrastructure and debilitating diseases are all severe constraints. Yet their governments have been professional and cooperative in fighting the locust infestation. By contrast, the developed world — by disjointed assistance and bungling — may put great areas of Africa at great risk of crop destruction and famine in 1987.

Peter Strzok is president of the nonprofit AFGRO (Agency to Facilitate the Growth of Rural Organizations) and a student at the Humphrey Institute.

Reader says he sees need for military censorship

If you ran the paper

Lou Gelfand

Peter Strzok, a retired Army officer, said that he was disturbed by my March 3 column about Star Tribune writer Paul McEnroe ("Reporter in war zone used fax to avoid censorship"). He also took issue with my comment that "the Pentagon's effort to control access to the news backfired in some ways."

McEnroe eluded censors with his tales of British commandos operating behind Iraqi front lines by using his hotel's facsimile machine.

Strzok asked, "Was he placing British commandos at risk by detailing their operations and methods used?

"Such operations are risky enough in total news blackout conditions; one is never sure what additional information can give an opponent a total picture of both the order of battle and probable next targets . . . .

"I spent two tours in Vietnam, two in Saudi Arabia and three in Iran. I think I understand the absolute need for reporter oversight in combat actions. Your apparent delight that McEnroe beat the system is terribly misplaced. You should, instead, have looked at the consequences of a profession unable to police itself, whether in pursuit of a good story, scoop or whatever."

Response: I commented that McEnroe and other journalists who drifted on their own would not have escaped the censors if the military had given them permission to join fighting units. Less than 150 of perhaps as many as 1,000 media personnel were assigned to combat units.

In Vietnam reporters freely joined combat units. That's how Peter Arnett, David Halberstam and other American journalists came to inform the American public that the U.S. government was not telling its people the truth about the war. There never were serious accusations that reporters revealed military secrets.

Reader Strzok is right that the military learned a lesson in Vietnam it has applied in Grenada, Panama and the Persian Gulf: Protect what the public knows by rigidly controlling the news media. It might be popular with the public at the time, but what happens when the day comes that the public needs the media and the Pentagon has them under quarantine?

■

Deb Gerber and Garrett Tomczak disputed my comment last Sunday that sports columnist Patrick Reusse had the right to criticize girls' basketball even though I disagreed with his stand.

Gerber said Reusse should have been disciplined. She wrote that Jimmy (The Greek) Snyder was fired from his CBS-TV job "after voicing his bigoted ideas about a group of people," and Andy Rooney of "60 Minutes" was suspended "when he referred to another group of people in a less than progressive manner."

(Rooney denied making the statement attributed to him in a magazine.)

She continued, "Patrick Reusse insults women athletes — students at that — and you write of 'freedom of expression' and the need for room for 'uncomfortable radical views.' Pardon me, sir, but I can't see the trees for the forest."

Tomczak wrote, "When you say, 'there needs to be room in the Star Tribune for uncomfortable radical views,' ask yourself this: If instead of impugning girls' basketball players, Patrick Reusse had written disparagingly of black athletes or remarked sarcastically about the limitations of Special Olympics participants, would he today have a job anywhere in the fourth estate? And would you have a job for defending his right to freedom of expression?"

Response: If I couldn't defend the First Amendment I would not want to be reader representative.

In a free society you allow someone with whom you disagree to be heard. Edward R. Murrow said, "The right of dissent . . . the right to be wrong, is surely fundamental to the existence of a democratic society."

■

A reader asked why the newspaper did not identify the driver who lost control of his car on Hwy. 252 and wound up in the back door of a Brooklyn Center apartment building. The March 11 story was displayed under a five-column headline.

Reporter Dan Oberdorfer got to the scene after the State Patrol and Brooklyn Center police left. He found a Minnesota Department of Transportation tag identifying the owner of the vehicle but the individual had an unlisted phone number.

Oberdorfer said he could not be sure that the owner was the driver, and because of deadline considerations elected not to identify the driver, who has not been charged.

■

The reader representative hears complaints and compliments Monday through Friday from 8:30 a.m. to 4:30 p.m. Phone 673-4450. From beyond the Twin Cities area call 1-800-752-8120.

Why can't world do for Bosnians what it's doing for the Kurds?

Robert J. White

Like the Muslims of Bosnia, the Kurds of northern Iraq know something about life and death under siege. Surrounded by enemies, people in both places rely on protected supply lines and help from the outside world.

There is a crucial difference, though. It makes one want to grab the outside leaders by their collars and yell in the faces of Bill Clinton, John Major, Francois Mitterrand and Boutros Boutros-Ghali: Do in Bosnia what you are doing so well in northern Iraq.

For the crucial difference is that a Kurdish recovery is taking place while the Bosnian disaster worsens.

The comparison is of course imperfect. Comparisons always are. Kurds are ethnically distinct; Bosnian Muslims are so like their Serbian and Croatian brethren that only loyalties and religion set them apart. Bosnians have a recognized country; Kurds do not.

But Kurds and Bosnian Muslims have much in common, including broken promises from the United States and deadly persecution by their neighbors. Last month the Kurdish leader Massoud Barzani told a New York Times reporter, "We are a people who faced genocide and managed to survive."

The words could as easily have come from Bosnia's President Alija Izetbegovic.

The promise to the Kurds was only implicit in the 1970s. It was a promise of aiding them against oppression from Iraq, and it was manifested through a quiet shipment of supplies, year after year, through Iran with the shah's approval. But as the price of a 1975 resolution by Iraq and Iran of their border dispute, Americans shut down that lifeline.

The Iraqis, unsurprisingly, repressed the Kurds more vigorously than before. And the 1975 agreement disintegrated five years later when Iraq launched its war against Iran.

The promise to Bosnia was more explicit. As a candidate in 1992, Clinton argued for lifting the arms embargo against the Bosnian government and using force if necessary to defend the Muslims. In office in 1993, the Clinton administration pursued those ideas with NATO allies, but tepidly; no one has acted upon either proposal.

The Kurds saw Iraq's defeat in the Gulf War as an opportunity to free themselves from their masters in Baghdad. When Iraqis crushed that revolt, coalition partners came to the aid of the Kurds. Nearly three years later, British, French and U.S. military forces are still present on the ground in Iraq's northwest corner — not to fight a war, but to signal allied seriousness. Their planes fly daily north of the 36th parallel. Iraqi forces keep their distance.

An array of agencies — U.N., Western governmental and mostly European nongovernmental — are helping the Kurds. Turkey, although trying to suppress a revolt of its own Kurdish minority, cooperates by providing the only overland road through which supplies reach the Kurds in Iraq.

Peter Strzok, head of the U.S. Office of Foreign Disaster Assistance operation in northern Iraq, was in the Twin Cities earlier this week. Prospects for the Kurds are improving, he said. They are rebuilding; with outside help, last year 100,000 were resettled in villages once destroyed by the Iraqis.

The emphasis on agriculture has dramatically increased crop production, Strzok said. He was here partly to encourage the University of Minnesota to send a technical assistance team to northern Iraq and partly to see his family. Strzok, who once was at the Humphrey Institute, still makes his home in Minneapolis.

In contrast, prospects for Bosnia are bleak. British, French, Canadian and other governments with military forces serving there under the United Nations are thinking of pulling out when the current U.N. mandate expires March 31. The United States faces no such dilemma because it has no troops on the ground helping to protect and move aid convoys to cities like Sarajevo and Tuzla.

While assaults on such cities continue, the allied leaders conduct a macabre diplomatic competition over who wants Balkan peace most. British Prime Minister Major conveys more discreetly the idea French President Mitterrand bluntly tells President Clinton: Get the Muslims to accept an unfair partition of Bosnia so that the shooting will stop.

Clinton objects because the United States — which said it would contribute peacekeeping forces once an agreement is in place — would then have to persuade, or perhaps force, the Muslims to comply. The administration doesn't want to be in that position.

But does a halt to the killing require that a peace plan first be accepted all around? Cease-fires in Bosnia mean nothing because they rely on nonexistent good will among Muslims, Serbs and Croats. Similarly, a cease-fire in northern Iraq would mean nothing if it relied on good will between Iraqis and Kurds.

Life for the Kurds of Iraq is improving, and although they suffer occasional violence from Iraq, they are no longer hounded, gassed and bombarded. Yet no lasting agreement is in sight. U.S. policy, and that of the allies, is carefully restricted to support for Kurdish autonomy, not independence. If Bosnia's political future is unclear, the Kurds' is more so.

Kurdish society is growing healthier because the United States and its European allies have made clear their determination to protect it. They have vacillated on Bosnia, which is painfully dying. What does it take to make President Clinton see the connection?

The political price

Regarding your April 16 editorial, "Israeli offensive": It seems clear that the United States has forfeited the moral high ground in its support of Israel's large-scale and punishing attacks in response to Hezbollah rockets sent into Israel. The response is clearly disproportionate to the effects of the rockets. While erratic and terrorizing, the human/material damage was not great.

Lebanon, controlled by Syria, fully understands that the United States is essential to permanent peace in that region. The scars inflicted by Israel causing a half-million refugees among Lebanon's 3-million-plus population will have a strong negative impact on the United States' honest broker role. A high price to pay for a rather transparent political decision. One wonders how many new Hezbollah applicants will rise from these Lebanese victims.

— Peter P. Strzok, Minneapolis.

Aid workers alarmed by attacks at food warehouses

Many other Iraqis living in exile in the United States are postponing long-awaited visits to their homeland because of the violence that persists there.

Insurgents are staging 10 to 25 attacks a day on U.S. forces in Iraq, Gen. Tommy Franks, former head of the U.S. Central Command, told a congressional committee this week. The shootings, grenade attacks and bombings are threatening relief work, even though most of the assailants have targeted military forces.

The Minneapolis-based American Refugee Committee sent a security expert to Iraq last week to assess safety for workers who are delivering relief in the country's southern regions. The committee received a $500,000 grant in May from the U.S. Agency for International Development to help distribute relief supplies, assess reconstruction needs and rebuild schools, clinics and other facilities. It is awaiting approval of a larger grant from the State Department for resettling Iraqis who are living in Iran, said Hugh Parmer, the committee's president.

"At this point, we have not had any incidents in which security problems have interfered with our operations," Parmer said.

Concern over looters

Even so, workers at several humanitarian organizations are alarmed. The United Nations World Food Program said in a statement on Thursday that there had been at least 12 incidents since June 10 of looting and shooting in or near food warehouses. The agency withdrew its staff from one Baghdad warehouse after it was attacked by several hundred looters. A few trucks bringing food into Iraq also have been hijacked, it said.

"These incidents have not yet halted the arrival and distribution of food, but we are worried their continuation could discourage commercial transporters from sending more trucks into trouble spots," said Amer Daoudi, the program's operations manager for Iraq.

Iraq poses one of the most significant tests the United States has faced since the Civil War in trying to hold together a chaotic political entity while also launching an immense reconstruction project, said Peter Strzok, who formerly directed humanitarian and development programs in the Middle East.

Strzok now lives in Washburn, Wis. and is independently organizing a program that involves sending reconditioned tractors, tillers and other aid to northern Iraq, where conditions are more secure than in the country's middle and southern regions.

"We believe that if we could set up in the north, we could eventually move south as security is established," he said.

The violence also is giving pause to companies aspiring to get a piece of potentially lucrative action in the oil-rich country that could be a hub for Middle East commerce. Still, they are betting on calmer days ahead.

Air service to resume

Northwest Airlines won preliminary approval last month to schedule service to Iraq. The authority granted by the U.S. Department of Transportation is subject to approval by the Federal Aviation Administration and other agencies. Other carriers with the authority are United Airlines, American Airlines, Delta, World Airways and Kalitta Air, transportation officials said.

Safety is a concern, and Northwest has set no timetable for launching the service it expects to provide via Amsterdam, said spokeswoman Mary Stanik. "Should we receive all of the other approvals, then we'll be ready to talk about what it might take in terms of security," she said.

At least four other Minnesota companies are negotiating contracts to do business in Iraq, said Odeh Muhawesh, president and CEO of Minnesota Middle East Trading Company Inc. He and two partners in Minneapolis promote themselves as catalysts for companies that want to tap into the huge public works investment the U.S. government is controlling in Iraq.

Muhawesh, who is of Jordanian descent, said he opened an office in Jordan last month and is negotiating with Iraqi business leaders as well as U.S. government officials for projects in the telecommunications and food processing industries. He declined to name the companies involved until contracts are sealed.

The business could be conducted through a secure free-trade zone in Jordan, relieving companies of the need to take risks in Iraq, Muhawesh said. His company, however, plans to open an office in Baghdad.

While Muhawesh "definitely is concerned about security," he also worries that Minnesota's leaders are timid about chasing potential business in Iraq. Minnesota risks losing a share of billions of dollars the United States and other countries are investing in Iraq, he said.

Muhawesh said that in discussions with federal agencies controlling reconstruction funding, he has learned that officials from other states are aggressively lobbying for their companies. Sen. Mark Dayton, a Democrat, has helped Minnesota companies secure a toehold in the bidding process, he said, but some other Minnesota officials at the state and congressional level have declined to lobby on behalf of local companies.

"My biggest disappointment has been our politicians," he said. "They just don't seem to get it. . . . They don't seem to understand the impact this could have."

One immediate impact of the war has been to give Iraqi exiles in the United States more open contact with relatives who had been afraid to speak frankly during telephone conversations that were assumed to be monitored by Saddam Hussein's government.

Taking the risk

It was a call from a cousin in Iraq that spurred Yacoub Aljaffery's decision in June to buy a plane ticket to Amman. His family in New Brighton was so worried about the danger that he didn't tell his mother where he was going, he said.

At the Iraqi border, U.S. military guards warned him to be careful passing through Fallujah, where attacks had been heavy, he said. He took their advice. In southern Iraq, Aljaffery heard gunfire at night, but he never felt threatened.

Upon arriving at a village near Nasiriyah, he traversed a narrow street between sand-colored houses and knocked on a grey door of a house he hadn't seen since he was 10 years old. The cousin who opened the door didn't know him, but an uncle just inside shrieked and fell to the ground.

Then began the crying, the hugging and the feasting. The family slaughtered a sheep and cooked it over an open fire.

Aljaffery felt a level of security his family hasn't known in Iraq during his lifetime, which has been marked by hostility between his Shiite people and Saddam, a Sunni Muslim. His father, a religious leader who was killed during the Shiites' 1991 uprising, now is openly honored as a martyr.

Electricity and water had been largely restored in the region, he said, and people were relishing simple freedoms such as the liberty to post a slogan on a wall. But the sense of well-being won't be complete, he said, until a permanent government under local control takes shape.

"When this happens, people will be a lot happier," he said. "Right now they don't know the future of their country."

BAYFIELD COUNTY

Man wants to donate farm equipment to Iraq

WASHBURN – Peter Strzok thinks the Midwest's old sheds and barns contain something that could help Iraq's shaky economy: farm equipment.

The Washburn man started a campaign this month to collect old garden tillers and farm equipment for shipment to Iraqi farmers.

He plans to collect the equipment in Ashland, recondition it with the help of volunteers and truck it to Duluth, Minn., for transfer to ship. He hopes to send his first shipment by September.

Even small, basic equipment could boost crop yields significantly in Iraq, said Schwan Rashid, an accountant in Des Moines, Iowa, who grew up farming in northern Iraq and has family there.

Time for Africa to Take Charge of Its Security?

By Peter P. Strzok, Special to The Pilot Dec 8, 2015

[Note: The author, who lives in Pinehurst, is president of the Minnesota-based Agency to Facilitate the Growth of Rural Organizations (AFGRO).]

I was an invited guest at the ***second Dakar Forum for Peace and Security for Africa, held Nov. 9-10 at Dakar, Senegal.*** *Some 800 attended.*

Under the patronage of the president of Senegal, Macky Sall, the conference drew experts on African security from all over the world, dominated by Africans and Europeans, who regard an unstable and weak Africa as directly threatening the stability of the European Union.

There is an uneven legacy of colonial Europe in Africa associated with granting independence to most African nations in the 1960s. The EU remains Africa's largest donor for development; it is also Africa's largest external market.

Increasingly confronted with multiple threats by terrorists organizations that are thriving in African territories, Europe and nations worldwide see the urgent need to expand help to Africa to strengthen its security capacities.

This concern seemed validated by the massacres in Paris and Bamako, Mali, shortly after the Dakar Forum. Similar atrocities occur on an almost daily basis, by Boko Haram in the Lake Chad region — by ISIS, expanding its power in Libya and Tunisia; attacks on U.N. peacekeeeping forces in Northern Mali; and maritime kidnappings on trade routes adjacent to Africa.

There are other considerations for a stable Africa.

There is more unused arable land in Africa than the rest of the world combined. The population of the world today is about 7 billion; by 2100, it will be 10.1 billion. Africa's share of that population today is 1 billion.

Combined with Asia's population, those two continents will represent, in 2100, 80 percent of the world's population.

The International Food Policy Research Institute (IFPRI) indicates that sufficient food production capacity to meet these population increases is not infeasible, with the assumption that unused arable land (with water) can be exploited under positive conditions. Absent this, there is the spectre of millions of destitute Africans and Asians fleeing to other continents/countries. This is the challenge.

What are my takeaways from the second Dakar Forum?

First, the president of Senegal spoke of the need to promote a "tolerant Islam" in Africa. *He asked assistance of Arab countries with schools of Islam, to assist Africans to better understand the attraction of jihadists and corrective responses. He stressed the need to professionalize African Union's military- ready forces, in training, equipment and in sharing intelligence on jihadists.*

Many experts spoke of the issues of porous borders, which, in this huge continent with vast open areas, present formidable problems to monitor and/or interdict human movements. This requires developing trust with local populations, not an easy task given that these diverse ethnic groups typically treat state authorities with distrust.

As to the U.S. roles: The deputy commander of USAFRICOM, Vice Admiral Franken, told a Reuters reporter that regional efforts against Boko Haram "could lead to a significant degradation of its activities within six months."

It is also true that country-specific U.S. assessments, which in the past were provided by staff working and traveling throughout host countries, visiting with village chiefs and other notables, are now greatly impeded by the cautionary, almost bunker-down conditions that describe official U.S. staff working in many African countries.

There remain the issues of wide-scale corruption by national leaders in many countries. Control of land by an elite few in several countries inhibit maximizing food production; incentives for those who work the land are negligible at best.

As to natural resources, such as oil, gas and other precious minerals, there is no country in Africa that has a positive record of using the proceeds from that wealth in a significant way for the public good.

There are many younger Africans, educated in technical skills and dedicated to the power of democratic practices for the common good, who are involving themselves in strategies to save Africa from its negative practices of the past. How they fare going forward against entrenched interests is a significant problem.

In a final request by African leaders to the United Nations, one expert calculated that the Security Council spends about 70 percent of its time debating crises and other urgent issues about Africa. It would seem an imperative that the African Union have a permanent seat on the Security Council

A final caveat: If Africa is to take charge of its future, it has to create the right incentives for its working class, mostly agriculturists, so as to minimize the poverty and despair that leads its youth to the join the expanding groups of terrorists.

Peter P. Strzok: 50-year di!erence in Iran

By Peter P. Strzok

[Sep 3, 2016]

Like many of you, I followed the news last month about the Russian Air Force's use of the ***Iranian Hamadan Air Base****. First reported on Aug. 15, it has been copiously covered by Russian TV and the Sputnik International websites and other international news agencies.*

The history of Hamadan Air Base provides a somber irony for Americans associated with Iran and the Middle East.

Following World War II, Presidents Truman and Eisenhower approved a massive development program for Iran. Its military component included efforts to contain the Soviet intrigues in Northwest Iran. To this end, the U.S. Army Corps of Engineers established the Tehran Engineer District, which would go on to build military installations designed to block penetration of Soviets to Iran and Iraq oil fields and contiguous warm water ports.

After the Soviets surprised the U.S. with testing of its atomic bomb in August 1949, part of the U.S. response was to build a series of air bases from which to launch B-47s, our first jet bombers capable of carrying atomic weapons. *On the southern flank, bases were in Morocco, Libya, Iran and Pakistan. Hamadan was multipurpose. It was a base for Iranian Air Force units, but it could also act as a recovery base for Northern African-based B-47s, whose combat range precluded their ability to reach Soviet targets and return to home base. Thus, Hamadan has three-mile runways, north to south; the strong prevailing winds are west to east.*

In 1965, I was an Army engineer captain assigned to the U.S. Military Mission to Iran. Fresh out of Persian language studies at Monterey, California, one of my jobs was to accept civic action schools being built from funds accrued from sales by Iran of food aid provided by the U.S. *These schools were being built in border areas, concentrating on nomadic groups such as the Kurds, Balouch, Turkoman, Azeris and Afghans, under the theory that educated nomads tend toward sedentary living with reduced security concerns. One was built in Marivan, a Kurdish village hard up against the Iraqi border. In October 1965, I flew from Tehran, in a de Havilland Otter, to meet with contractors and Tehran Engineer District staff, to turn over the Marivan school for transfer to the government to Iran.*

Our pilot, an army engineer involved with topographic mapping of Iran, stopped at Manadan to refuel. With a strong west-to-east wind, and given the Otter's expansive wing area, he decided he could not use the north-south runways. With the agreement of the Iranian base commander, he had the Otter pulled into a hangar and took off into the wind, using the parking area to gain takeoff. We landed in a harvested wheat field in Marivan. With his villagers, the village chief celebrated this new gift - an elementary school for the children, a first in the region.

Some 50 years later, the roles are reversed. News reports last month indicated Russia was granted use of Hamadan and was using its best aircraft to take the fight to both ISIS and Syrian opponents of President Assad.

Not so fast. Iranian leadership was apparently offended by the powerful Russian public relations efforts over its air force's use of Hamadan. On Aug. 22, the Iranian foreign minister's spokesman, Bahram Qassemi, spun the story this way: "Russia made a request to use Iran's territory to battle against the terrorists in Syria. ... They got our temporary permission for that. ... The deployment is temporarily finished. ... Russia has no airbase in Iran." (Tehran Times, Aug 24).

Russian-Iranian history is replete with confrontations. From the late 19th century to 1945, Russia had control over much of the northern half of Iran, with the British managing the southern half. Xenophobia is pervasive in Iran. After the glorious history of enlightened leaders such as Cyrus and Darius, Persia decayed too often into a corrupt and fragmented governance. Outsiders are still often viewed with distrust, no matter how much benefit Iran might gain. In the case of Hamadan, Iranian leadership was offended by Russia's exuberant reporting of its TU-22M3 strategic bombers and Sukhoi SU-34s - a sales pitch by Russia, impinging on Iran's sovereignty.

By the way, the village of Marivan has grown substantially. Reports about Iran's nuclear program show it to have important activities in applied nuclear research. I last viewed the Marivan area from the Iraqi side of the border, in 1994. I was escorting U.S. visitors to Penjwen, a Kurdish Iraqi village that is called "the Iraqi Verdun" because of its almost total destruction, a strategic site won and lost many times during that horrific war, 1980-88.

Peter P. Strzok lives in Pinehurst. He was a longtime member of the Army Corps of Engineers. Since 1980, he has worked at village levels in over 13 countries in West Africa.

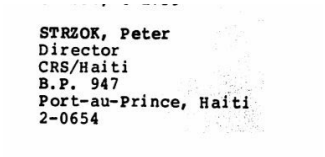
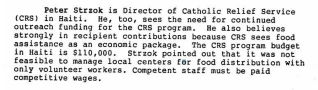
"20) 9:30AM, Wednesday, June 20th, 1985 - Peter Strzok (The Father) is in Haiti for a quarterly meeting for "Maximizing Development Assistance. #ConfessionsofanEconomicHitman "

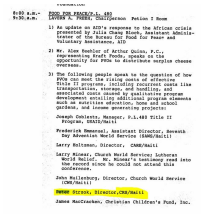


STRZOK, Peter
Director
CRS/Haiti
B.P. 947
Port-au-Prince, Haiti
2-0654



Peter Strzok is Director of Catholic Relief Service (CRS) in Haiti. He, too, sees the need for continued outreach funding for the CRS program. He also believes strongly in recipient contributions because CRS sees food assistance as an economic package. The CRS program budget in Haiti is $110,000. Strzok pointed out that it was not feasible to manage local centers for food distribution with only volunteer workers. Competent staff must be paid competitive wages.

Peter Strzok, Director of Catholic Relief Services (CRS) in Haiti, also serves on the executive committee of HAVA (Haitian Association of Voluntary Agencies). He described three associations that serve to coordinate the efforts of voluntary agencies:



9:00 A.M.- Peter Strzok, Director, P.L.480
9:30 A.M. Catholic Relief Services Petion I Room

1) An update on AID's response to the African crisis presented by Rita Chang Nixon, Assistant Administrator, Bureau for Food for Peace and Voluntary Assistance, AID

2) Mr. Alex Dechter of Arthur Quinn, P.C., representing Kraft Foods, speaks on the opportunity for PVOs to distribute surplus cheese from Kraft.

3) The following people speak to the question of how PVOs can best use Title II resources. Under Title II programs, including recurrent costs like transportation, storage, and handling, and development activities, including food-for-program development activities, including food-for-program development activities, including additional program elements such as nutrition education, home and school gardens, and income generating projects.

Joseph Deblants, Manager, P.L.480 Title II Program, CRS/HAITI

Frederick Emmanuel, Assistant Director, Seventh Day Adventist World Service (SDAWS/Haiti)

Larry Reitsman, Director, CRWS/Haiti

Larry Minear, Church World Service; Lutheran World Relief. Mr. Minear's backstopy read into the record, as he was to COULD not attend this conference.

John Hollenburg, Director, Church World Service (CWS/Haiti)

Peter Strzok, Director,CRS/Haiti

James MacCracken, Christian Children's Fund, Inc.

2) A quick background: Peter Paul Strzok II (FBI) has a father named Peter Paul Strzok who was born in 1933. We know he was in the Army Corp of Engineers - Catholic Relief Services - President of a non profit (AFRGO) and has worked all over the world.

3) In 1991 - Just before getting a contract with USAID for Disaster Relief in Iraq --- **Peter Strzok [II (born 1936)]** started a company based in "Minnesota" called **"MINAFCO, INC."** VERY LITTLE INFO ON THIS COMPANY. I believe changed address to WI in 2002.

MINAFCO, INC.

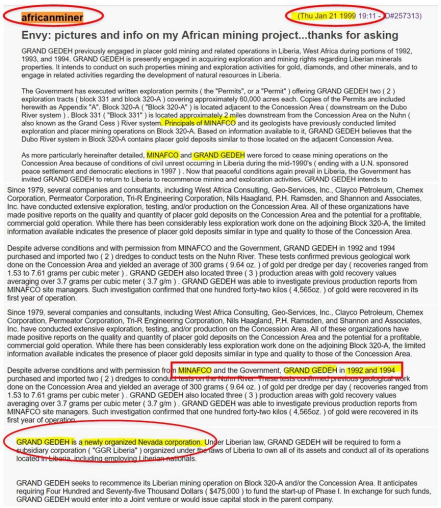
5) Well - I believe it is a GOLD MINING COMPANY. In an old archived gold investment blog --- look who decided to share some details... "africanminer" I believe this is actually PETER STRZOK. I'll show you in a bit. READ THIS



africanminer (Thu Jan 21 1999 19:11 - ID#257313)

Envy: pictures and info on my African mining project...thanks for asking

GRAND GEDEH previously engaged in placer gold mining and related operations in Liberia, West Africa during portions of 1992, 1993, and 1994. GRAND GEDEH is presently engaged in acquiring exploration and mining rights regarding Liberian minerals properties. It intends to conduct on such properties mining and exploration activities for gold, diamonds, and other minerals, and to engage in related activities regarding the development of natural resources in Liberia.

The Government has executed written exploration permits (the "Permits", or a "Permit") offering GRAND GEDEH two (2) exploration tracts (block 331 and block 320-A) covering approximately 60,000 acres each. Copies of the Permits are included herewith as Appendix "A". Block 320-A ("Block 320-A") is located adjacent to the Concession Area (downstream on the Dubo River system) . Block 331 ("Block 331") is located approximately 2 miles downstream from the Concession Area on the Nuhn (also known as the Grand Cess) River system. Principals of MINAFCO and its geologists have previously conducted limited exploration and placer mining operations on Block 320-A. Based on information available to it, GRAND GEDEH believes that the Dubo River system in Block 320-A contains placer gold deposits similar to those located on the adjacent Concession Area.

As more particularly hereinafter detailed, MINAFCO and GRAND GEDEH were forced to cease mining operations on the Concession Area because of conditions of civil unrest occurring in Liberia during the mid-1990's (ending with a U.N. sponsored peace settlement and democratic elections in 1997) . Now that peaceful conditions again prevail in Liberia, the Government has invited GRAND GEDEH to return to Liberia to recommence mining and exploration activities. GRAND GEDEH intends to

Since 1979, several companies and consultants, including West Africa Consulting, Geo-Services, Inc., Clayco Petroleum, Chemex Corporation, Permeator Corporation, Tri-R Engineering Corporation, Nils Haagland, P.H. Ramsden, and Shannon and Associates, Inc. have conducted extensive exploration, testing, and/or production on the Concession Area. All of these organizations have made positive reports on the quality and quantity of placer gold deposits on the Concession Area and the potential for a profitable, commercial gold operation. While there has been considerably less exploration work done on the adjoining Block 320-A, the limited information available indicates the presence of placer gold deposits similar in type and quality to those of the Concession Area.

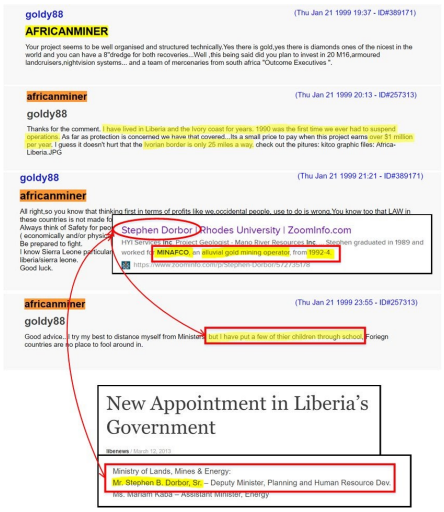
Despite adverse conditions and with permission from MINAFCO and the Government, GRAND GEDEH in 1992 and 1994 purchased and imported two (2) dredges to conduct tests on the Nuhn River. These tests confirmed previous geological work done on the Concession Area and yielded an average of 300 grams (9.64 oz.) of gold per dredge per day (recoveries ranged from 1.53 to 7.61 grams per cubic meter) . GRAND GEDEH also located three (3) production areas with gold recovery values averaging over 3.7 grams per cubic meter (3.7 g/m) . GRAND GEDEH was able to investigate previous production reports from MINAFCO site managers. Such investigation confirmed that one hundred forty-two kilos (4,565oz.) of gold were recovered in its first year of operation.

Since 1979, several companies and consultants, including West Africa Consulting, Geo-Services, Inc., Clayco Petroleum, Chemex Corporation, Permeator Corporation, Tri-R Engineering Corporation, Nils Haagland, P.H. Ramsden, and Shannon and Associates, Inc. have conducted extensive exploration, testing, and/or production on the Concession Area. All of these organizations have made positive reports on the quality and quantity of placer gold deposits on the Concession Area and the potential for a profitable, commercial gold operation. While there has been considerably less exploration work done on the adjoining Block 320-A, the limited information available indicates the presence of placer gold deposits similar in type and quality to those of the Concession Area.

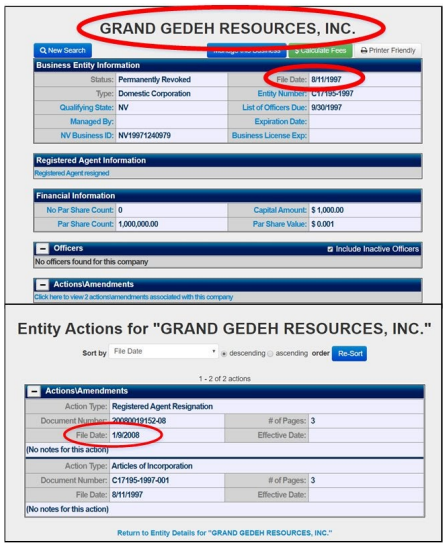
Despite adverse conditions and with permission from MINAFCO and the Government, GRAND GEDEH in 1992 and 1994 purchased and imported two (2) dredges to conduct tests on the Nuhn River. These tests confirmed previous geological work done on the Concession Area and yielded an average of 300 grams (9.64 oz.) of gold per dredge per day (recoveries ranged from 1.53 to 7.61 grams per cubic meter) . GRAND GEDEH also located three (3) production areas with gold recovery values averaging over 3.7 grams per cubic meter (3.7 g/m) . GRAND GEDEH was able to investigate previous production reports from MINAFCO site managers. Such investigation confirmed that one hundred forty-two kilos (4,565oz.) of gold were recovered in its first year of operation.

GRAND GEDEH is a newly organized Nevada corporation. Under Liberian law, GRAND GEDEH will be required to form a subsidiary corporation ("GGR Liberia") organized under the laws of Liberia to own all of its assets and conduct all of its operations located in Liberia, including employing Liberian nationals.

GRAND GEDEH seeks to recommence its Liberian mining operation on Block 320-A and/or the Concession Area. It anticipates requiring Four Hundred and Seventy-five Thousand Dollars ($475,000) to fund the start-up of Phase I. In exchange for such funds, GRAND GEDEH would enter into a Joint venture or would issue capital stock in the parent company.



6) Why do I believe "africanminer" is Strzok??? Well - he refers to a newly organized Nevada corporation "Grand Gedeh." Let's have a look. This blog post was written in 1999 --- Grand Gedeh incorporated in 1997. But wait --- When was it dissolved???



7) Yep - that's right. The SAME EXACT DATE that MINAFCO, INC (Strzok's company) was dissolved. Coincidence? I think not. Strzok's involved with GOLD MINING IN AFRICA ___ and probably getting the elected officials the #DeepState wants --- Like Stephen B Dorbor.

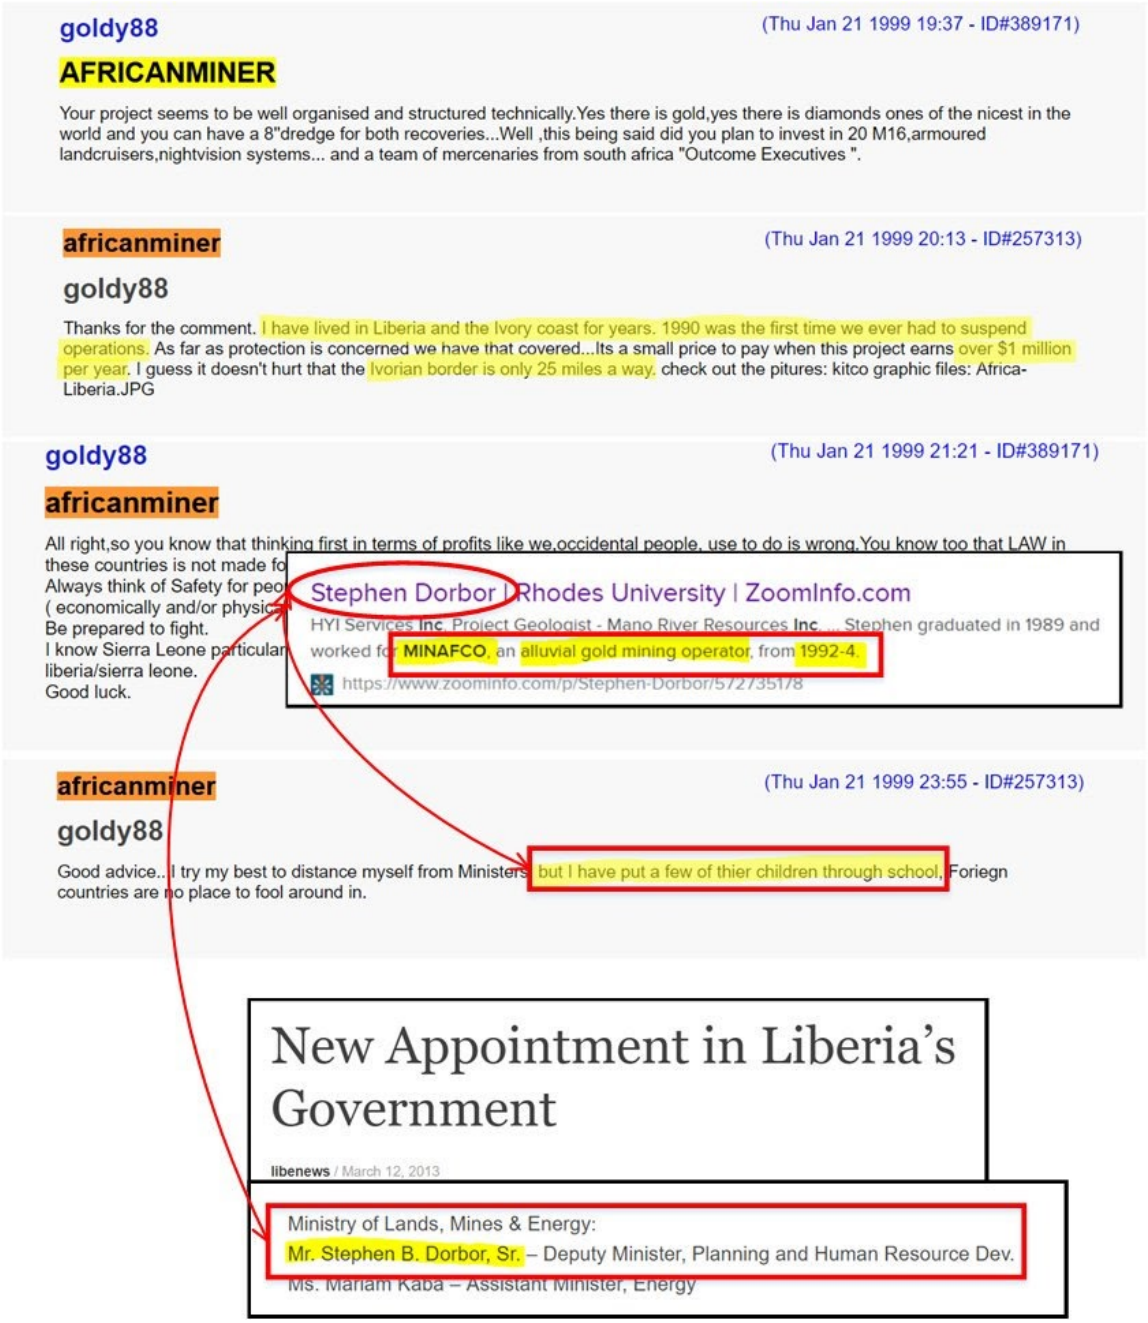
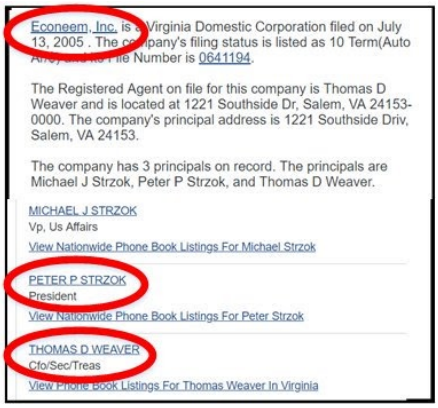
In exchange for such funds, GRAND GEDEH would enter into a Joint venture or would issue capital stock in the parent company.

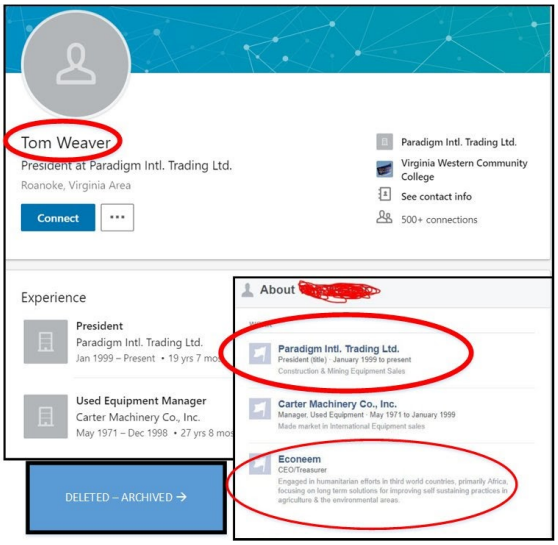


8) So under the guise of "Catholic Relief Services" and "USAID" and "Humanitarian Efforts" he's also involved with getting mineral rights in poor countries like Liberia. Fascinating. Makes me think of the book "Confessions of an Economic Hitman" --- But wait - IT GETS BETTER!!

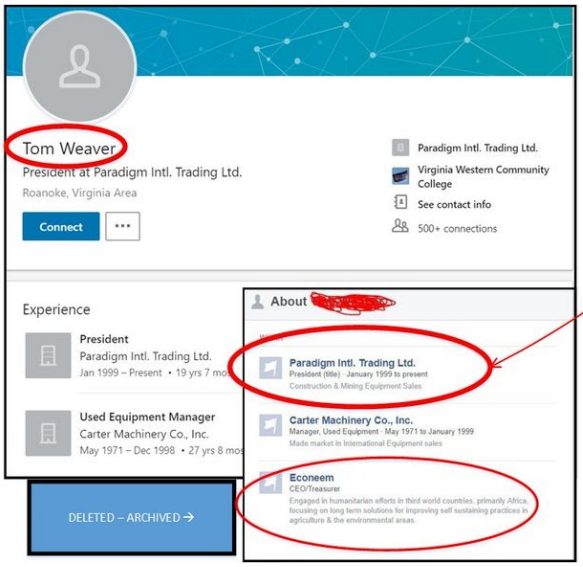
9) He also is involved with a company called, "Econeem, Inc." a Virginia based company. Unironically, it has been "PURGED" from the state website. So what''s special about Econeem, Inc?

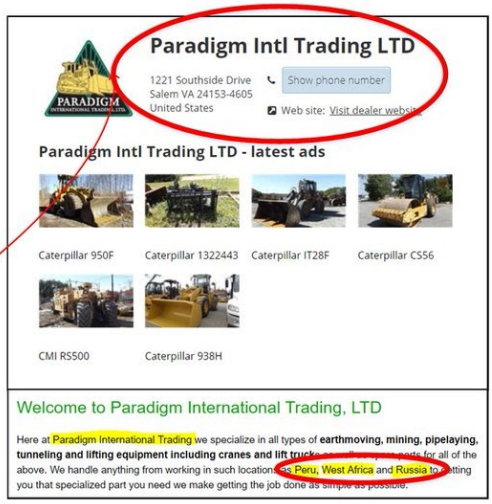


10) Registered agent "Thomas Weaver" may give us a clue. Pay attention to the ADDRESSES for this company. Strzok also was apart of a paper published for the World bank / USAID called "NEEM"



11) Thomas Weaver - for whatever reason - scrubbed is position with Econeem [archived by the anons of course] and is the President of Paradigm International Trading. Now they say they work internationally. Peru, West Africa, and Russia.





12) In 2003, Peter Strzok (the father) mentions that it would be good to send "Farm Equipment" to help with "Iraq." Interesting....

A 2003 article in the Fond du Lac Commonwealth Reporter newspaper in Wisconsin reprinted an Associated Press story that reported Strzok, the elder, "thinks the Midwest's old sheds and barns contain something that could help Iraq's shaky economy: farm equipment."

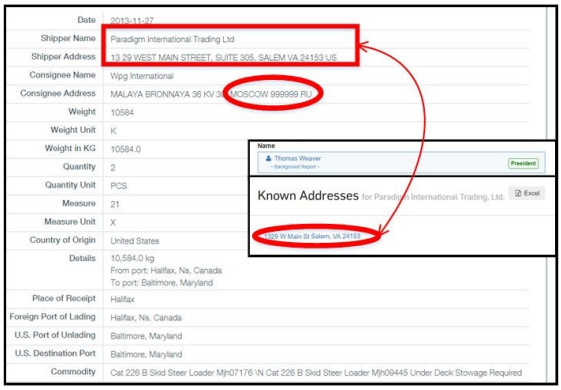
He planned to collect the equipment in Ashland, Wisconsin, recondition it and then truck it to Duluth, Minnesota to ship it to Iraq.

He also wrote a column in the Minneapolis Star Tribune in 1986. In it, he described visiting the Ivory Coast, Mali, Burkina Faso, Senegal and Gambia to "see the condition of the crops."

A 2003 article in the Minneapolis Star-Tribune reported that Strzok, the father, was living in Washburn, Wisconsin and "is independently organizing a program that involves sending reconditioned tractors, tillers, and other aid to northern Iraq, where conditions are more secure than in the country's middle and southern regions."

The article says that Strzok, the father, "formerly directed humanitarian and development programs in the Middle East."

13) Iraq you say? How about --- RUSSIA??? Please confirm that the ADDRESSES match in relation to Thomas Weaver - agent/president of Paradigm International Trading. Yes - they could be sending Equipment --- and who else knows what..... Does USAID get special treatment?



14) Summary: Peter Strzok was involved with a gold mining company that brought in $1MM + a year in Liberia. Probably assisted with installing favorable ministers. He was/is involved with shipping "equipment" internationally. 🔽 for full layouts. @Thomas1774Paine @CoreysDigs

Wes Sundquist

https://biobeat.nigms.nih.gov/2018/05/interview-with-a-scientist-wes-sundquist-how-the-host-immune-system-fights-hiv/

POSTED ONMAY 30, 2018

Interview with a Scientist: Wes Sundquist, How the Host Immune System Fights HIV

BY STEVE CONSTANTINIDES

For more than 30 years, NIGMS has supported the structural characterization of human immunodeficiency virus (HIV) enzymes and viral proteins. This support has been instrumental in the development of crucial drugs for antiretroviral therapy such as protease inhibitors. NIGMS continues to support further characterization of viral proteins as well as cellular and viral complexes. These complexes represent the fundamental interactions between the virus and its host target cell and, as such, represent potential new targets for therapeutic development.

In this second in a series of three video interviews with NIGMS-funded researchers probing the structure of HIV, Wes Sundquist,Link to external web site professor of biochemistry at the University of Utah, discusses his lab's studies of how HIV uses factors in host cells to replicate itself. In particular, Sundquist focuses on the ESCORT pathway that enables HIV to leave infected cells and spread infection elsewhere.

Sundquist also talks about the University of Utah's Center for the Structural Biology of Cellular Host Elements in Egress, Trafficking, and Assembly of HIV (CHEETAH).Link to external web site This center uses computational and experimental methods to analyze HIV molecular complexes and determine how they interact with and commandeer cellular machinery to move themselves throughout cells and tissues. By visually reconstructing virus particle assembly and trafficking, CHEETAH aims to develop HIV into a leading model for understanding how human viruses interact with cellular hosts, and to provide a platform for designing new therapeutic strategies.

Dr. Sundquist's work is funded in part by the NIH under grants 5R01GM112080 and 2P50GM082545.

Wesley I. Sundquist

University of Utah

Election Year: 2014

Primary Section: 21, Biochemistry

Membership Type: Member

Biosketch

Wes Sundquist is Benning Professor and Co-Chair of Biochemistry at the University of Utah School of Medicine. Sundquist is a biochemist recognized for his work on HIV assembly, virus-host interactions and the Endosomal Sorting Complexes Required for Transport (ESCRT) pathway. He is known particularly for defining the structure of the HIV capsid and for demonstrating that HIV and other enveloped viruses usurp the ESCRT pathway to bud from cells. Sundquist was born in St. Paul, Minnesota in 1959 and grew up in St. Paul and Washington, DC He graduated from Carleton College, Northfield, Minnesota with a degree in chemistry and from Massachusetts Institute of Technology with a PhD in chemistry (with Steve Lippard). He was postdoctoral fellow at the MRC Laboratory of Molecular Biology, in Cambridge, England (with Aaron Klug) and joined the faculty in the Biochemistry Department at the University of Utah in 1992. He has received a Searle Scholars Award, the ASBMB Amgen Award for the Application of Biochemistry and Molecular Biology to the Understanding of Disease, the Bernard Fields Award for Retrovirology, and a Distinguished Alumnus Award from Carleton College. He is a member of the American Academy of Arts and Sciences and the National Academy of Sciences.

Research Interests

Wes Sundquist's laboratory studies the molecular and structural biology of retroviruses, with particular emphasis on the Human Immunodeficiency Virus (HIV). Projects in the laboratory focus on understanding the architecture and assembly of the viral particle, the mechanisms of intrinsic host cell defenses, and the process of virus budding. The laboratory also studies the cellular roles of the ESCRT pathway in the cytokinesis and its regulation by the abscission checkpoint. We are particularly interested in understanding how the ESCRT machinery catalyzes the membrane fission reactions required for virus budding and cell division. Experimental approaches include NMR, EM, and crystallographic studies of viral complexes, biochemical analyses of the interactions between viral components and their cellular partners, and genetic and cell biological studies of protein functions.

Patrol Yacht:

- *The third **Sylph** was built in 1890 by John Roach and Co., Chester, PA*
- *Acquired by the Navy in June 1898*
- *Commissioned **USS Sylph** 18 August 1898 at the Norfolk Navy Yard for use as a Presidential Yacht*
- *Designated a Patrol Yacht, **PY-5**, 17 July 1921*
- *Decommissioned 27 April 1929 at the Norfolk Navy Yard*
- *Struck from the Navy list 29 April 1929*
- *Sold 26 November 1929 to Mr. Frank B. Clair of Brooklyn, NY (Mr. Clair was reportedly an ex-bootlegger). Mr. Clair and his partner Captain John Nugent converted her into a party fishing boat and*

*operated her from Sheepshead Bay, Brooklyn, NY. The **Sylph** fished from Sheepshead Bay until April 1939, when she changed her business and ran a ferry service from Sea Gate, Brooklyn to the Battery in Manhattan. In 1941, her owners defaulted on the mortgage held by the Worthington Diesel Company and they took possession of the vessel*

- *Fate unknown.*

Specifications:

- *Displacement 152 t.*
- *Length 123' 8"*
- *Beam 20'*
- *Draft 7' 6"*
- *Speed 15 kts.*
- *Complement 31*

1921 - 35

- *Armament: 1905 - One 6-pounder*

1914 - None

- *Propulsion: Two Almy boilers, one 550ihp vertical triple-expansion steam engine, one shaft*

1935 - Replaced by a 400hp Worthington diesel engine.

Source: "Stuart Symington - A Life" (See [HB000H][GDrive])

*According to family tradition, the original Symington in America, **James [Symington]**, arrived from Scotland in 1785. 1 He landed in Philadelphia, where he worked as a stonecutter. Aboard ship he had met **Margaret Ogilvie**, a young Scotswoman traveling alone. Her marital status at the time remains unclear. Either she was the widow of a man named William Ogilvie, or she was running away from an unhappy marriage with him. Divorce was hard to come by in Scotland in the eighteenth century. Margaret had left behind two children, apparently with her mother, and was pregnant with a third, [but] she completely captivated young James Symington, who was making his way co America from Ayrshire.*

*How Margaret paid for her passage to America is unknown. [...]. At some point she became acquainted with another passenger, Robert Morris, the wealthy Philadelphia banker and signer of the Declaration of Independence who was famed as the "financier of the Revolution." Morris invited her to join his household as housekeeper or governess. Her child, a daughter initially named Deborah Morris, was born in the Morris home, and when in 1787 her shipboard acquaintance persuaded her to marry him, she was given away by Morris. About a year after their marriage, James and Margaret Symington moved to a house on **Brandywine Creek**, near Wilmington, where James operated a mill for grinding flint. In 1800 they moved to Baltimore and James resumed the stonecutting trade. Apparently he did rather well. When he died in 1827, he left an estate of seventy-five thousand dollars, a substantial sum in the early nineteenth century.*

*James adopted Deborah, and he and Margaret eventually had two more daughters and three sons, one of whom was **Thomas [Symington], born December 23, 1793**, on Brandywine Creek. Thomas served as an apprentice to his father in the stonecutting trade, and then as a young man went to work for William Stuart, who had a stonecutting and marble business. Stuart, whose father had fought in the War of the Revolution, became lieutenant colonel of the U.S. Infantry defending Baltimore during the War of 1812, being credited, according to family legend, with "saving" Fort McHenry during the British naval bombardment the night of September 13, 1814, when he took over from the commandant, alleged to have been drunk. In addition to being a war hero, William Stuart was a successful businessman who was active in politics. He served several terms on the Baltimore city council and as a member of the Maryland House of Delegates. He had a short term as mayor of Baltimore, after which he became president of the Maryland Institute of Arts. His daughter, Angeline, whom Thomas Symington married in 1825, was obviously quite a catch.*

[Thomas Symington's wife Angele passed when he was at the age of seventy-one.] He [then] married Mary Wilson, thirty-seven, whom he had met at the Episcopal Church, where she was the church organist; she bore him two children before he died in 1875 at the age of eighty-two.

***Thomas Symington did well financially, making substantial sums in real estate, marble quarries, and chemicals and fertilizer. He furnished much of the marble for the 1850 addition to the capitol building in Washington. He provided the cornerstone of the Washington Monument as a gift.** Unlike many others, including his son, he seems to have survived the Civil War financially intact. In 1862 he retired to a farm outside Baltimore, which he named " Indian Spring," managing his various business enterprises in addition to farming. When he died, he left an estate of one hundred thousand dollars in cash and what apparently was a substantial unrecorded balance that he divided among his children.*

OFFICE BALTIMORE AND SUSQUEHANNA RAILROAD COMPANY,
Baltimore, May 12, 1848.

SIR: I have the pleasure of acknowledging the receipt of your letter of the 5th instant, enclosing a resolution of your society, asking the free transmit over our road of the corner-stone of the National Washington Monument, from the quarry of Thomas Symington, which he has generously donated.

The necessary instructions have been given for its free transmit; and I assure you it has given the board of directors and myself much pleasure in paying this small tribute to the memory of the father of our country, and the pioneer in its internal improvements.

I have the honor to be, with great respect, your obedient servant,
R. M. MAGRAW.

WILLIAM BRENT, esq.,
1st Vice President
National Washington Monument Society.

[HN006U][GDrive]

[HN006U][GDrive]

Those who have but one apartment in which they must of necessity perform all the domestic duties, should be careful to remove all matters that are offensive in smell, as cabbage, water, dirty soap-suds, &c.; they should indeed, if possible, avoid washing in the room they live in. For the same reason, drying clothes in-doors should be avoided.

Flowers in water, and living plants in pots, greatly injure the purity of the air during the night, by giving off large quantities of an air (carbonic acid) similar to that which is separated from the lungs by breathing, which, as before stated, is highly noxious. On this account they should never be kept in bed-rooms: there are instances of persons who have incautiously gone to sleep in a close room in which there has been a large growing plant, having been found dead in the morning, as effectually suffocated as if there had been a charcoal stove in the room.

A constant renewal of the air is absolutely necessary to its purity: for in all situations it is suffering either by its vital part being absorbed, or by impure vapors being disengaged and dispersed through it. *Ventilation, therefore, resolves itself into the securing of a constant supply of fresh air.*

In the construction of houses, especially in those built for the poor, this great object has been too generally overlooked, when, by a little contrivance in the arrangement of windows and doors, a current of air might, at any time, be made to pervade every room of a house of any dimensions. Rooms cannot be well ventilated that have no outlet for the air; for this reason there should be a chimney to every apartment. The windows should be capable of being opened, and they should be situated on the side of the room opposite to, and furthest from, the fire-place, that the air may traverse the whole space of the apartment in its way to the chimney.

Fire-places in bed-rooms should not be stopped up with chimney-boards. The windows should be thrown open for some hours every day, to carry off the animal effluvia which are necessarily separating from the bed-clothes, and which should be assisted in their escape by the bed being shaken up, and the clothes spread abroad, in which state they should remain as long as possible; this is the reverse of the usual practice of making the bed, as it is called, in the morning, and tucking it up close, as if with the determination of preventing any purification from taking place. Attention to this direction, with regard to airing the bed-clothes and bed after being slept in, is of the greatest importance to persons of weak health. Instances have been known in which restlessness and an inability to find refreshment from sleep would come on in such individuals when the linen of their beds had been unchanged for eight or ten days. In one case of a gentleman of a very irritable habit, who suffered from excessive perspiration during the night, and who had taken much medicine without relief, he observed that, for two or three nights after he had fresh sheets put upon his bed, he had no sweating; and that, after that time, he never awoke, but that he was literally swimming, and that the sweats seemed to increase with the length of time he slept in the same sheets. By not permitting him to sleep in the same sheets or night-clothes more than twice without their being washed, he instantly lost his debilitating affection. F.

MONUMENT TO WASHINGTON.

WASHINGTON, July 4th, 1848.

MR. EDITOR:—I need not tell you this has been a great day in the metropolis. Not only has the birth-day of our country been celebrated after the old custom, but we have deposited with appropriate ceremonies, upon Monument Square, the corner stone of a monument to Washington, "which will declare to generations yet unborn how their fathers venerated the memory of him who was the Father of his own country, and the admiration of the world." The number of people who flocked into the city yesterday afternoon from every quarter of the compass, was truly immense, and the same business has continued nearly the whole of this day.

The weather has been truly delightful, sunny but comparatively cool, and the recent showers had so thoroughly cleaned the streets that we were not tormented with the dust. During the morning the streets were completely thronged with spectators; flags were flying from every public building in town, and at various places were hung across the avenue with such mottos as the following—"May our country always be right, but right or wrong, always our country," and again—"First in war, first in peace, and

[HN006V][GDrive]

first in the hearts of his countrymen." The most picturesque feature, however, was the *procession*, which was under the command of Major General Quitman, who was assisted by Gen. George Cadwalader, Col. May and Maj. A. A. Nicholson. It was formed in front of the City Hall, and at twelve o'clock precisely took up its line of march. I cannot tell you how long it was, but I know this, that it took forty minutes for it to pass the corner of a street. The military display was exceeding imposing, and I regret that I cannot give you the names of the various companies which were in the procession. But besides these, there were the President of the United States, heads of departments, the Supreme Court Judges, the Diplomatic Corps, the Masons, the Odd Fellows, Members of Congress, delegates from neighboring States, temperance orders, Rechabites, the corporate authorities of Alexandria, Georgetown and Washington, the benevolent and literary societies of the city, revolutionary officers, several well disciplined bands of firemen, the Monument Society and any quantity of citizens.

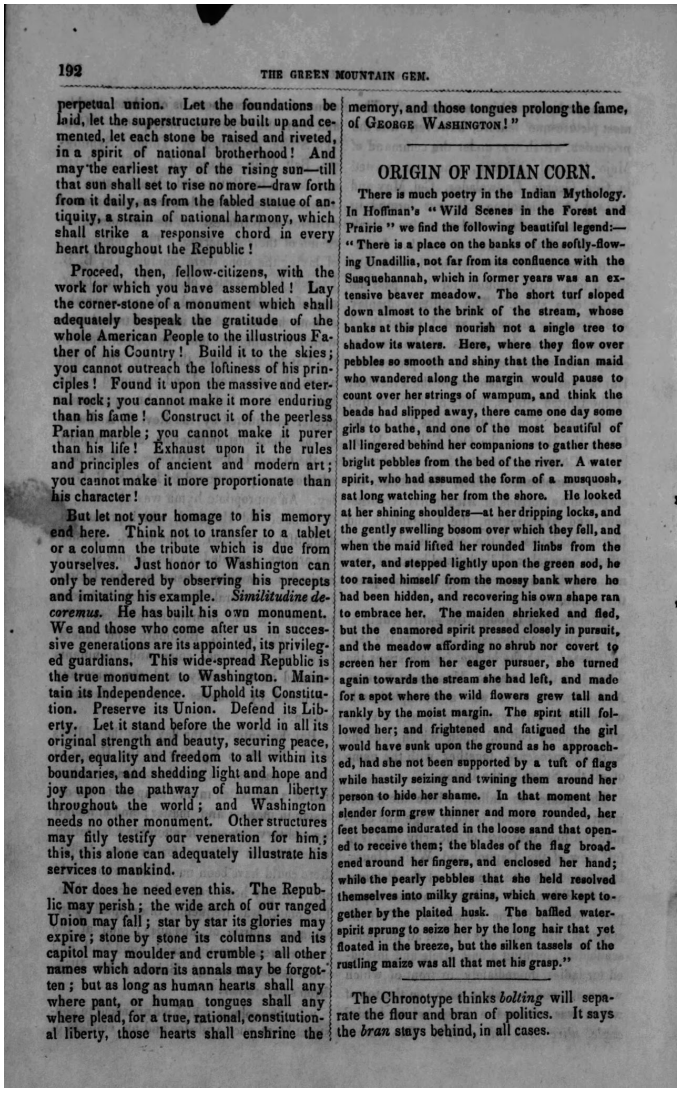
After passing through the entire length of the avenue, the procession turned to the left, and passed over the bridge, (which spans the Tiber,) on their way to Monument Square. At this bridge there was a triumphal arch, white as the driven snow,'(for it was covered with bleached cotton,) upon which was the word *Independence*, together with the name of all the States in the Union.

The square, so called, where the monument is to be erected, is very large and commands a fine prospect of the city, and is in full view of the Capitol and White House. It is formed by the junction of the Potomac and the Tiber, and is indeed a most appropriate location for the monument. Near the center of this square was erected an immense scaffolding, forming a half circle and intended for ladies, immediately in front of which was a stupendous white arch, on the top of which was chained a *large white headed eagle, alive and full of life.* The corner stone of the monument is of white marble, and bears the following inscription—"Corner Stone, presented by Thomas Symington, Balt. 1848.—Executed by Thos. Berry and Alexander Rutherford, Washington."—The assembled multitude were ranged around evincing deep interest in the memorable occasion of their gathering. The ceremonies of laying the stone were conducted by B. B. French, Esq., Master of the Masonic fraternity of this District, and it is not unworthy of note that he used the identical trowel with which Washington laid the corner stone of the Capitol, and wore the same gloves and apron, the later worked and presented by the lady of Gen. Lafayette. An appropriate prayer was offered by the Rev. C. A. Davis, of the Methodist persuasion, and Chaplain of the Grand Lodge of Masons, and the benediction was pronounced by Rev. R. R. Gurley. An appropriate hyma was also sung to the tune of Old Hundred, which produceda delightful impression on the mind. Among the articles deposited in the corner stone, I noticed a complete census of the United States, and several flags, which had been presented to the monument association by the young men of Baltimore and others. Corn, oil and wine, coins and documents enclosed in the cavity, and the ceremony completed by remarks from the officiating mason.

But the feature of the day was the address of Mr. Winthrop Speaker of the House of Representatives. It was the brilliant production of a cultivated mind; adapted to the occasion in manner and matter; and although the auditory listened in attentive admiration to its eloquent delivery for over two hours there could have been none there who would not willingly have remained twice the time. The orator was frequently interrupted by involuntary bursts of applause; and at the close retired from the stand amid loud and enthusiastic cheering. Below is Mr. Winthrop's peroration:

"Let the column which we are about to construct be at once a pledge and an emblem of

[HN006W][GDrive]



192 THE GREEN MOUNTAIN GEM.

perpetual union. Let the foundations be laid, let the superstructure be built up and cemented, let each stone be raised and riveted, in a spirit of national brotherhood! And may the earliest ray of the rising sun—till that sun shall set to rise no more—draw forth from it daily, as from the fabled statue of antiquity, a strain of national harmony, which shall strike a responsive chord in every heart throughout the Republic!

Proceed, then, fellow-citizens, with the work for which you have assembled! Lay the corner-stone of a monument which shall adequately bespeak the gratitude of the whole American People to the illustrious Father of his Country! Build it to the skies; you cannot outreach the loftiness of his principles! Found it upon the massive and eternal rock; you cannot make it more enduring than his fame! Construct it of the peerless Parian marble; you cannot make it purer than his life! Exhaust upon it the rules and principles of ancient and modern art; you cannot make it more proportionate than his character!

But let not your homage to his memory end here. Think not to transfer to a tablet or a column the tribute which is due from yourselves. Just honor to Washington can only be rendered by observing his precepts and imitating his example. *Similitudine decoremus.* He has built his own monument. We and those who come after us in successive generations are its appointed, its privileged guardians. This wide-spread Republic is the true monument to Washington. Maintain its Independence. Uphold its Constitution. Preserve its Union. Defend its Liberty. Let it stand before the world in all its original strength and beauty, securing peace, order, equality and freedom to all within its boundaries, and shedding light and hope and joy upon the pathway of human liberty throughout the world; and Washington needs no other monument. Other structures may fitly testify our veneration for him; this, this alone can adequately illustrate his services to mankind.

Nor does he need even this. The Republic may perish; the wide arch of our ranged Union may fall; star by star its glories may expire; stone by stone its columns and its capitol may moulder and crumble; all other names which adorn its annals may be forgotten; but as long as human hearts shall any where pant, or human tongues shall any where plead, for a true, rational, constitutional liberty, those hearts shall enshrine the memory, and those tongues prolong the fame, of GEORGE WASHINGTON!"

ORIGIN OF INDIAN CORN.

There is much poetry in the Indian Mythology. In Hoffman's "Wild Scenes in the Forest and Prairie" we find the following beautiful legend:—"There is a place on the banks of the softly-flowing Unadillia, not far from its confluence with the Susquehannah, which in former years was an extensive beaver meadow. The short turf sloped down almost to the brink of the stream, whose banks at this place nourish not a single tree to shadow its waters. Here, where they flow over pebbles so smooth and shiny that the Indian maid who wandered along the margin would pause to count over her strings of wampum, and think the beads had slipped away, there came one day some girls to bathe, and one of the most beautiful of all lingered behind her companions to gather these bright pebbles from the bed of the river. A water spirit, who had assumed the form of a musquash, sat long watching her from the shore. He looked at her shining shoulders—at her dripping locks, and the gently swelling bosom over which they fell, and when the maid lifted her rounded limbs from the water, and stepped lightly upon the green sod, he too raised himself from the mossy bank where he had been hidden, and recovering his own shape ran to embrace her. The maiden shrieked and fled, but the enamored spirit pressed closely in pursuit, and the meadow affording no shrub nor covert to screen her from her eager pursuer, she turned again towards the stream she had left, and made for a spot where the wild flowers grew tall and rankly by the moist margin. The spirit still followed her; and frightened and fatigued the girl would have sunk upon the ground as he approached, had she not been supported by a tuft of flags while hastily seizing and twining them around her person to hide her shame. In that moment her slender form grew thinner and more rounded, her feet became indurated in the loose sand that opened to receive them; the blades of the flag broadened around her fingers, and enclosed her hand; while the pearly pebbles that she held resolved themselves into milky grains, which were kept together by the plaited husk. The baffled water-spirit sprung to seize her by the long hair that yet floated in the breeze, but the silken tassels of the rustling maize was all that met his grasp."

The Chronotype thinks *bolting* will separate the flour and bran of politics. It says the *bran* stays behind, in all cases.

[HN006X][GDrive]

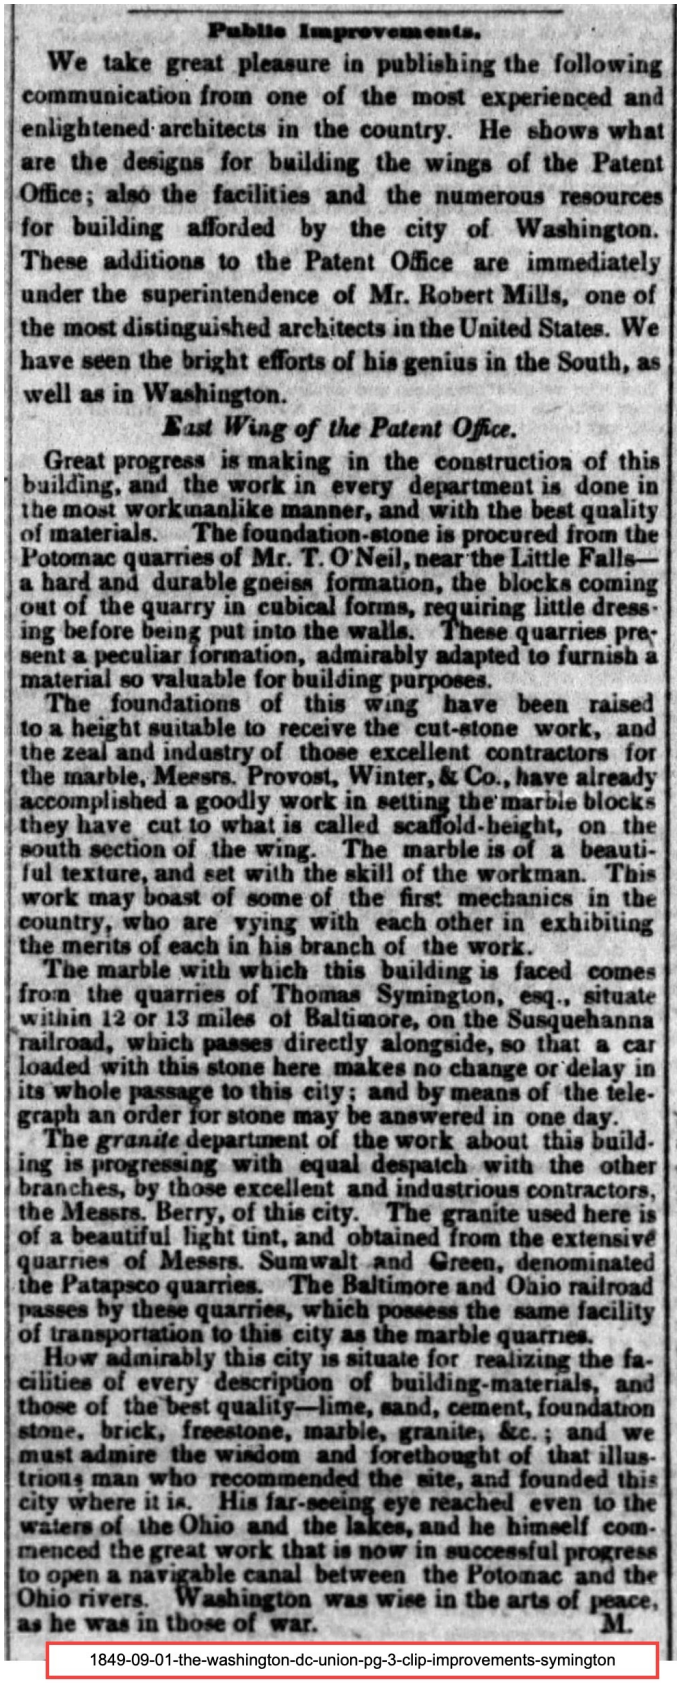
[HN006Y][GDrive]



Public Improvements.

We take great pleasure in publishing the following communication from one of the most experienced and enlightened architects in the country. He shows what are the designs for building the wings of the Patent Office; also the facilities and the numerous resources for building afforded by the city of Washington. These additions to the Patent Office are immediately under the superintendence of Mr. Robert Mills, one of the most distinguished architects in the United States. We have seen the bright efforts of his genius in the South, as well as in Washington.

East Wing of the Patent Office.

Great progress is making in the construction of this building, and the work in every department is done in the most workmanlike manner, and with the best quality of materials. The foundation-stone is procured from the Potomac quarries of Mr. T. O'Neil, near the Little Falls—a hard and durable gneiss formation, the blocks coming out of the quarry in cubical forms, requiring little dressing before being put into the walls. These quarries present a peculiar formation, admirably adapted to furnish a material so valuable for building purposes.

The foundations of this wing have been raised to a height suitable to receive the cut-stone work, and the zeal and industry of those excellent contractors for the marble, Messrs. Provost, Winter, & Co., have already accomplished a goodly work in setting the marble blocks they have cut to what is called scaffold-height, on the south section of the wing. The marble is of a beautiful texture, and set with the skill of the workman. This work may boast of some of the first mechanics in the country, who are vying with each other in exhibiting the merits of each in his branch of the work.

The marble with which this building is faced comes from the quarries of Thomas Symington, esq., situate within 12 or 13 miles of Baltimore, on the Susquehanna railroad, which passes directly alongside, so that a car loaded with this stone here makes no change or delay in its whole passage to this city; and by means of the telegraph an order for stone may be answered in one day.

The *granite* department of the work about this building is progressing with equal despatch with the other branches, by those excellent and industrious contractors, the Messrs. Berry, of this city. The granite used here is of a beautiful light tint, and obtained from the extensive quarries of Messrs. Sumwalt and Green, denominated the Patapsco quarries. The Baltimore and Ohio railroad passes by these quarries, which possess the same facility of transportation to this city as the marble quarries.

How admirably this city is situate for realizing the facilities of every description of building-materials, and those of the best quality—lime, sand, cement, foundation stone, brick, freestone, marble, granite, &c.; and we must admire the wisdom and forethought of that illustrious man who recommended the site, and founded this city where it is. His far-seeing eye reached even to the waters of the Ohio and the lakes, and he himself commenced the great work that is now in successful progress to open a navigable canal between the Potomac and the Ohio rivers. Washington was wise in the arts of peace, as he was in those of war. M.

a perpetual or draw kiln.

Mr. Thomas Fortune and Mr. Antipas Harrington are also quarrying a great quantity of marble for Mr. Thomas Symington, on the property of Messrs. Griscom & Burrough. It is used on the National buildings at Washington, and for the face of the Washington Monument. We noticed in the quarries some immense circular blocks intended for the columns of the Patent Office.—They are also engaged in getting out the blocks for the pedestal of Mills' equestrian statue of Jackson. The blocks are six in number, some 13 by 6 feet in size, and 2 feet thick, and the four largest weigh about 19 tons each. These immense blocks are transported the whole distance to Washington by railroad, on cars prepared expressly for the purpose.

SECOND BRANCH.—Branch met—Mr. Griffith presented the petition of Thomas Symington in relation to a grievance complained of—referred to the committee on the harbor. The President laid before the Branch a communication from the appeal tax court in relation to property which may be taken into direct taxation—referred to the committed of ways and means. Mr. Gill called up the resolution for repairing the bridges over Harford run at Eden street and Spring street, by arching the run. The resolution was amended by striking out all that part relating to Spring street, and then adopted. Mr. Farlow called up the ordinance providing for enclosing the Eastern Fountain lot with an iron railing on a granite base, which was passed. Mr. Suter offered an ordinance requiring the Register to make record of streets which are condemned, &c.—laid on the table. Mr. Suter called up the ordinance to tunnel McKim street from Eager to Madison street, which was passed. Mr. Suter called up the resolution adverse to the petition of J. Howard McHenry, which was passed. Adj.

Clerk's Office of the Circuit Court of the county of Preston, on the 5th day of July, 1854:—

Wm. E. Tutt and John P. Byrne, *Complainants,*

vs.

Thomas Symington, *Defendant,*

In Chancery.

The object of this suit is to subject a certain Tract of Land in Preston county, purchased of the Complainants by the Defendants, to the payment of the purchase money on a lien reserved therefor in the deed of Complainants to Defendants; and it appearing by affidavit that the said Defendant is not a resident of this State; on motion of the complainants by their counsel, it is ordered that the said Defendant do appear here within one month after due publication of this notice, and do what is necessary to protect his interest; and that a copy of this order be published in the Monongalia Mirror, a weekly newspaper published in Morgantown, Monongalia county, once a week for four successive weeks, and posted at the front door of the court house of this county, on the first day of the next County Court.

[HN0078][GDrive]

The Maryland Central Railroad.

We were handed a letter addressed to a gentleman of this town by Thomas Symington, Esq., of this county, conveying information in regard to the above road, which must be of general interest to our citizens. We do not concur in the opinion that we shall not be able to carry out successfully the "Edgewood Railroad affair," as it is denominated by Mr. S., but on the contrary look hopefully to the completion of that enterprise at no distant day. However, in this matter we have no antagonisms to foster. If we can have the Maryland Central Road by any renewed exertions on the part of our people, in the common interests of us all let us go to work again, and neglect no opportunities that may be offered us in this connection. We publish the communication as a matter of much importance to the citizens of this county, and

shall be glad to further the interests of the enterprise in any manner we shall be able to do so:

INDIAN SPRING, Feb. 24th, 1870.

DEAR SIR:—I suppose you will not be able to carry out successfully the Edgewood Railroad affair, and that the Bel Air people and papers, including their legal gentlemen, will be willing to show as much zeal in the Maryland Central as they have done with the former. If so, now is the time to show it.

A memorial, signed by the heaviest taxpayers in the city, is now before the Councils, asking them to subscribe to the Maryland Central $400,000, upon condition that $1,100,000 be raised from other sources. If the bill be passed, our road will go on at once. We have the *official* promise of the Philadelphia & Baltimore Central Company, indorsed by the P., W. & B. R, R. Co., that if we raise $500,000, or *near* it, and get the right of way, they will finish the road.

If the above bill is passed, we will stand thus:

City subscription, - - -	$400,000
Private, - - - - -	150,000
P., W. & B. R. R., - - -	950,000
Total, - - - - - -	$1,500,000

If the city should subscribe say $300,000
or less, our private subscription must make
up, with the city subscription say, $475,000
Phila., R. R., - - - - 1,025,000

1,500,000.

If the city should refuse to subscribe, but offer to endorse bonds, we must try and get them to take a second lien, so that the Phila. Company get the first.

Respectfully,

THOS. SYMINGTON.

BUY ANCESTRAL ESTATE.

Symington Brothers Get Back Indian Spring Farm in Maryland.

Special to The New York Times.

BALTIMORE, Md., Jan. 10.—Charles J. Symington of New York City and his brother, Donald, of Baltimore County, have bought from Dr. O. H. Hoffman the famous Indian Spring Farm and estate at Priestford Bridge, Harford County, Md.

The property thus returns to the family ownership with which its name was so long associated, the purchasers being grandsons of the late Thomas Symington.

The estate, embracing 536 acres, was sold by Herman Stump in 1862 to Thomas Symington, who greatly improved it until it was sold in 1900 by the Symington heirs. Since then it has been owned by B. Howard Haman and the late John D. Worthington of Belair.

EARLY LIFE

Thomas and Angeline had two daughters and four sons. The oldest of the sons, born January 5, 1839, they understandably named William Stuart, after Angeline's father.

This first W Stuart Symington [who became ***William Stuart Symington I*** *]- as is true of all his descendants who have borne the name, he dropped " William" -* ***enlisted in the Virginia Militia at the age of twenty-two to fight for the Confederacy in the Civil War****. He became a second lieutenant at the outset and about a year later was appointed first lieutenant in the Confederate Army. Stuart became an aide to his first cousin by marriage, General George E. Pickett, and served in that capacity throughout the war. He fought with Pickett at Five Forks, Drewry's Bluff, Gettysburg, and Petersburg. Near the end of the Seven Days in June 1862, he disobeyed Pickett's orders to join him in Richmond and stayed behind to participate in the Battle of Frayzer's Farm. His horse was shot seven times and finally killed. He also had a horse shot out from under him during the futile, bloody assault on Cemetery Ridge in the waning hours of the Battle of Gettysburg. In command of Union troops at Cemetery Ridge was* ***Brigadier General James S. Wadsworth****, whose granddaughter* ***Evelyn*** *would become Mrs. W Stuart Symington III.*

Lieutenant Symington remained with Pickett during all of the dreary months from Gettysburg to Appomattox and was among those cited by Pickett, in his final report to General Lee, "for gallantry and untiring zeal. " He surrendered his sword as a captain, but throughout the rest of his life he was referred to as "Major." ***Whatever his rank, his devotion to the Lost Cause remained undiminished. In its obituary of him, the Baltimore Sun wrote, "wild horses would not have dragged an admission from him that he believed that the South was in the wrong. " Rather than sign the Oath of Allegiance required of all former Confederate officers, he went to Germany, studying at the University of Heidelberg, until the frenzy calmed down.*** *He was vice president of the Society of the Army and Navy of the Confederate States in Maryland, and in the last year of his life the society gave a testamentary dinner for him, the only person they had ever so honored up to that time. Three days before his sudden death on June 9, 1912 - he collapsed after a game of golf on a hot Sunday afternoon - he had led a parade of Confederate veterans celebrating the Confederate Memorial Day.*

After returning to Baltimore from Germany, Major Symington went into the fertilizer business. Apparently, he was not very good at it.

Note: Among others of the ***Davison, Symington and Company*** *was his younger brother* ***Thomas Alexander Symington II (born 1842)*** *) (approximately 1855 ... see Excellent 1951 scanned book on Davison Chemical's history up until 1951: 1951-10-davison-book-its-background-and-contributions-since-1832-chester-hockley-ocr.pdf / https://drive.google.com/open?id=1tYLksPXWxqfoAADLEsGhHqtetVoxalH-); Later on, this became known as the* ***Davison Chemical Company*** *in the late 1800s.*

The company went into bankruptcy, and its owner lost everything. *The family had to sell their big house on Charles Street and move into a small, rented house on North Avenue, not a particularly fashionable part of the city.* ***Later he recovered somewhat, serving as secretary of the Consolidated Gas Company in Baltimore. By the time of his death, he was looked upon as one of Baltimore's leading citizens and, even in the midst of the family's most serious financial vicissitudes, they moved in Baltimore's most fashionable society.***

One reason for that could well have been the woman Major Symington had the good fortune to marry. While in Richmond during the war on a recruiting trip, he attended a debutante ball at which he met a beautiful young woman named ***Lelia Skipworth Powers****, daughter of a prominent Episcopal clergyman. In addition to her beauty, she possessed an impeccable Virginia lineage. Through her mother she was a direct descendant of Benjamin Harrison, who was married to Anne Carter, daughter of Robert "King" Carter, whose descendants included the Lees. After returning from Germany, Major Symington went back to Richmond and persuaded Lelia to marry him. They made a handsome couple, and, before Lelia died at the age of forty-four, they had a daughter and seven sons. The sons were all strapping young men, inheriting physiques that reflected their father's strength and their mother's beauty. All of them, with one exception, went into business and became financially successful.*

Obituary

Source - [HN006S][GDrive]

*"[**Thomas A Symington II** was a] well-known insurance man and Confederate veteran. Mr. Thomas A. Symington, assistant manager of the local office of the **Fidelity and Casualty Company, of New York**, died [January 19, 1900] at his home, 1013 North Calvert street [of Baltimore].*

Mr. Symington was born in Baltimore 58 years ago [...]. He was educated in private schools in Baltimore and in Connecticut. At the outbreak of the Civil War he entered the Confederate Army as ordnance sergeant in Gen. James Gearing's battalion and soon after was made a lieutenant on General Gearing's staff. He served through the war and surrendered at Appomattox. He was released on parole to go to his home and remain undisturbed until exchanged. He went to the home of his father, Thomas Symington, at Belair. Md.. where he was arrested by the Federal officer in command there and lodged in jail. Through certain influences at Washington he was released, with the understanding that he leave the country. He had a short time before refused to take the oath of allegiance because Gen. Kirby Smith was still in the field, and, therefore, would not admit that the war was over. He went to Europe, where he remained for a year.

*Upon his return be engaged in the fertilizer and chemical manufacturing business with his brother, **W. Stuart Symington**. [We believe this was with the **Davison, Symington and Company**]. Afterward he became connected with the Fidelity and Casualty Company, of New York.*

When the Fifth Maryland Regiment was organized he was made adjutant and shortly after the railroad riots was matte lieutenant-colonel of the regiment. His wife, who was a daughter of Mr. W. W. Spence, died several years ago. He Is survived by one married daughter - Mrs. Jesse B. Riggs - two unmarried daughters and two son."

*Co-Founder [along with his younger brother **William Stuart Symington I (b1839)**] of the **Davison, Symington and Company** (approximately 1855 ... see Excellent 1951 scanned book on Davison Chemical's history up until 1951: [HB000J][GDrive]); Later on, this became known as the **Davison Chemical Company** in the late 1800s.*

1013 North Calvert street [of Baltimore] : SYMINGTON FAMILY HISTORY - BEFORE THOMAS A. SYMINGTON WAS BORN

"Stuart Symington - A Life" / Page 1 - 4

Source: "Stuart Symington - A Life" (See [HB000H][GDrive])

*According to family tradition, the original Symington in America, **James [Symington]**, arrived from Scotland in 1785. 1 He landed in Philadelphia, where he worked as a stonecutter. Aboard ship he had met **Margaret Ogilvie**, a young Scotswoman traveling alone. Her marital status at the time remains unclear. Either she was the widow of a man named William Ogilvie, or she was running away from an unhappy marriage with him. Divorce was hard to come by in Scotland in the eighteenth century. Margaret had left behind two children, apparently with her mother, and was pregnant with a third, [but] she completely captivated young James Symington, who was making his way co America from Ayrshire.*

*How Margaret paid for her passage to America is unknown. [...]. At some point she became acquainted with another passenger, Robert Morris, the wealthy Philadelphia banker and signer of the Declaration of Independence who was famed as the "financier of the Revolution." Morris invited her to join his household as housekeeper or governess. Her child, a daughter initially named Deborah Morris, was born in the Morris home, and when in 1787 her shipboard acquaintance persuaded her to marry him, she was given away by Morris. About a year after their marriage, James and Margaret Symington moved to a house on **Brandywine Creek**, near Wilmington, where James operated a mill for grinding flint. In 1800 they moved to Baltimore and James resumed the stonecutting trade. Apparently he did rather well. When he died in 1827, he left an estate of seventy-five thousand dollars, a substantial sum in the early nineteenth century.*

*James adopted Deborah, and he and Margaret eventually had two more daughters and three sons, one of whom was **Thomas [Symington], born December 23, 1793**, on Brandywine Creek. Thomas served as an apprentice to his father in the stonecutting trade, and then as a young man went to work for William Stuart, who had a stonecutting and marble business. Stuart, whose father had fought in the War of the Revolution, became lieutenant colonel of the U.S. Infantry defending Baltimore during the War of 1812, being credited, according to family legend, with "saving" Fort McHenry during the British naval bombardment the night of September 13, 1814, when he took over from the commandant, alleged to have been drunk. In addition to being a war hero, William Stuart was a successful businessman who was active in politics. He served several terms on the Baltimore city council and as a member of the Maryland House of Delegates. He had a short term as mayor of Baltimore, after which he became president of the Maryland Institute of Arts. His daughter, Angeline, whom Thomas Symington married in 1825, was obviously quite a catch.*

[Thomas Symington's wife Angele passed when he was at the age of seventy-one.] He [then] married Mary Wilson, thirty-seven, whom he had met at the Episcopal Church, where she was the church organist; she bore him two children before he died in 1875 at the age of eighty-two.

***Thomas Symington did well financially, making substantial sums in real estate, marble quarries, and chemicals and fertilizer. He furnished much of the marble for the 1850 addition to the capitol building in Washington. He provided the cornerstone of the Washington Monument as a gift.** Unlike many others, including his son, he seems to have survived the Civil War financially intact. In 1862 he retired to a farm outside Baltimore, which he named " Indian Spring," managing his various business enterprises in addition to farming. When he died, he left an estate of one hundred thousand dollars in cash and what apparently was a substantial unrecorded balance that he divided among his children.*

2019-06-07-research-pol-tech1-geneology-symington1-clip2.jpg / https://drive.google.com/open?id=1OJhHy5S6e3G3rOxxTnsDIOPv-ldw-QqV

Son of **William Stuart Symington I (born 1839)** (Co-Founder of the **Davison, Symington and Company** - Which was the name of the **Davison Chemical Company** in the late 1800s.)

Father of **William Stuart Symington III (born 1901)** .

Source: "Stuart Symington - A Life" (See [HB000H][GDrive])

*[**William Stuart Symington II's** mother was] **Lelia Skipworth Powers**, a daughter of a prominent Episcopal clergyman. In addition to her beauty, she possessed an impeccable Virginia lineage. Through her mother she was a direct descendant of Benjamin Harrison, who was married to Anne Carter, daughter of Robert "King" Carter, whose descendants included the Lees. [...] Lelia died at the age of forty-four, [which is after her and husband **William Stuart Symington I**] had a daughter and seven sons. The sons were all strapping young men, inheriting physiques that reflected their father's strength and their mother's beauty. All of them, with [the one exception of **W. Stuart Symington II**], went into business and became financially successful.*

*[The young **William Stuart Symington II**] had no interest in business, but instead went to Johns Hopkins University, where he studied language and literature. He became fluent in three foreign languages and ultimately received a Ph.D. in French literature. An athlete as well as a student, he was captain of the football team at Hopkins and played lacrosse on a Baltimore club team that won a national championship. At the age of twenty-three he received an appointment as an associate professor of romance languages at Stanford; after a year he returned east to become a full professor at Amherst College. Two years later, on November 17, 1897, he married **Emily Haxall Harrison**, a young woman of rare beauty and, apparently, rather daunting determination. Like many southerners, the Harrisons had lost everything in the Civil War, and Emily brought little to the marriage except her beauty, her strong personality, deep religious convictions, and some fine antique furniture.*

*[**William Stuart Symington II** and his wife **Emily Symington**] had six children: a daughter, Louise, and five sons, the oldest being **W. Stuart Symington III** , born June 26, 1901.*

With a growing family, the young professor and his wife found it difficult to make ends meet on a salary that was never more than one hundred dollars per month. Moreover, teaching may have lost some of its allure, possibly because of the situation at Amherst. Family legend has it that from the beginning of his tenure, Professor Symington had difficulty with the college janitor. Then one day, so the story goes, he used some blackboards that were still wet. The janitor, observing this from the door, shouted, " He wrote on them boards." The students laughed, and young Symington, knowing that his control of the class was in jeopardy, called the janitor and threw him out. Deciding that he had better report the incident to the president, he was met with the comment, "This man is the first janitor we have had here in many years who is able to keep Amherst warm in the winter; so, especially in that you are relatively new, if it came to which one of you would have to leave, I wouldn't give much for your chances with the Board of Trustees." After this episode, he is supposed co have gone home and told his wife, "Pack up. The janitor has more weight than I do."

Emily (Harrison) Symington and baby Stuart [aka William Stuart Symington III]. Symington family photograph.

In any event, in 1903 Professor Symington resigned his post at Amherst and moved his family to New York, where he enrolled in the law school at New York University. They had virtually no money, and Emily was too proud to cake any help from their relatives, some of whom were quite well off. As a result, her husband eked out a living as a translator while attending school. Their son remembered the first years of his life "as years of real poverty. "

1906 - 1913

[In 1906 (see news on passing), William Stuart Symington II finished law school at the University of Maryland.]

Judge Stuart Symington (II) , family photograph

[Fresh out of law school, **William Stuart Symington II**] took his family back to Baltimore, where he began the practice of law. He met with only sporadic success, and complicated his life by engaging in a number of unsuccessful business and real estate ventures.

"Much of his attention after he began the practice of law and especially to the interests of the **Symington Company** manufacturers of railroad devices, of which his brothers were the officers." [news article]

The family's fortunes waxed and waned. At times they were very poor, and even when they enjoyed a degree of prosperity, there never seemed to be enough money, at least not enough to support the way of life to which they aspired and which their ancestry would seem to predict. Moreover, they felt disadvantaged when they compared their situation to that of the other Symington brothers, all of whom were successful in business. [...]The family had a pleasant home, built with help from Uncle Tom, in Roland Park, one of the pioneering upscale residential developments in the country, IO but after a few years they had to give it up and move back to the city, living first in a small apartment and then a small house.

1914 (Summer) - Wife and children go to Switzerland

In the summer of 1914, however, Emily took all of the children - by then numbering six - on an extended tour of Europe. [...] Emily settled the family in a small Swiss hotel in Vevey, a pleasant little town between Lausanne and Montreux on the shore of Lac Leman. She put the children in school, primarily to learn French [...].

Apparently, [his wife Emily] had no specific plans to return home. She rarely heard from her husband, but his infrequent letters were red-letter events for the entire family. [**William Stuart Symington II**] rarely sent money, and before long the family was desperately short of funds, [and on August 20 the oldest child noted], "We are now staying entirely on credit." [...]

Whatever Emily's plans, the outbreak of World War 1 cut them off. After some hesitation, she decided that she should return home. She took the family to London and with help from [brother-in-law] Powers, a captain in the navy, booked passage on the Britannia, arriving in New York on October 22 [1914].

Then it was back to the little house in Baltimore. Indeed, the transition from summer in Switzerland to winter in Baltimore was symbolic of the roller-coaster kind of existence the family endured. Their finances, never equal to Emily's aspirations, created severe tensions between an easygoing [husband] and a strong-willed, determined [wife].

1915 - 1919

When the United States entered the World War Mr. Symington attempted to enter the ranks of a fighting arm of the United States Army. he was rejected after a physical examination.

"During and after World War I, actively involved in management of his brother's business, Symington Corporation." See [HG000J][GDrive].

He then turned his attention to such patriotic work as he could do outside the army. In 1919, at a meeting in Cleveland, he was elected president of the **Association of Manufacturers of War Materials**.

One of his activities during the war was to organize a $6,000,000 unit of the Symington Company in Chicago for the manufacture of 155-millimeter shells. He was the president of this unit. It had just been completed when the war ended.

1921 - Purchases Gibson Island, Maryland

(founder of **Gibson Island**)

1924 - Appointed to Supreme Bench in Maryland

"Appointed by Governor Albert C. Ritchie to Supreme Bench of Baltimore City, 1924. Died while serving on bench. Noted by his colleagues for having mastered academics, business, and law." See [HG000J][GDrive].

1926 (Feb 19) - Passed

Baltimore evening Sun - Friday Feb 19 1926 : (full page from newspaper - [HN004Y][hGDrive]

W. S. SYMINGTON, SUPREME BENCH MEMBER, DEAD

Jurist Succumbs To Illness Started By Tooth Infection.

CONDITION REGARDED AS SERIOUS FOR WEEKS

Years As Teacher Preceded Lawyer And Judge Career.

Judge W. Stuart Symington died today in the Johns Hopkins Hospital.

He had been ill since December with an ailment which began with an infected tooth.

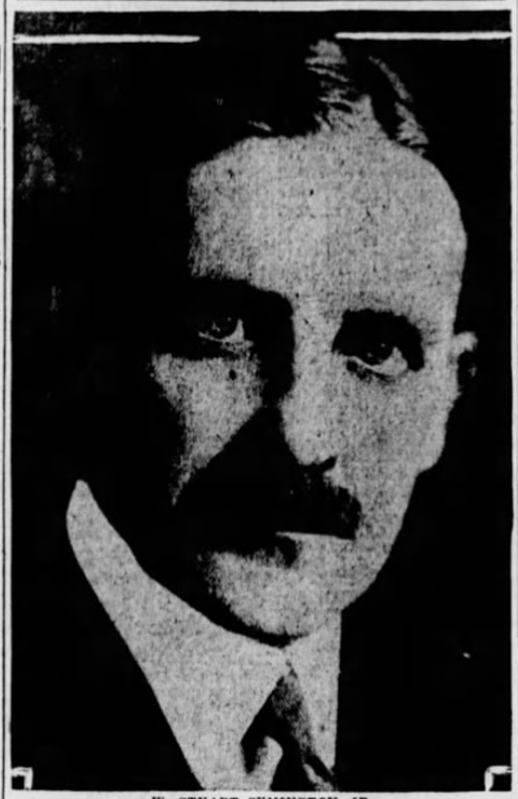
Moved To Hopkins.

At first a patient in the Union Memorial Hospital, he was moved to the Johns Hopkins Hospital for special observation some weeks ago.

It had been known for weeks that the character of his illness was dangerous.

The Supreme Bench will hold a memorial meeting within a few days to pass suitable resolutions in connection with Judge Symington's death, the judges decided today.

Jurist Who Died Today



W. STUART SYMINGTON, JR.

Judge Symington was a member of one of two Baltimore families which had long been conspicuous in Baltimore society for the numbers of sons it included. The other family was the Riggs group of brothers. William P. Riggs, a member of the latter family, died early this month.

Was Teacher First.

Born in Baltimore fifty-five years ago, the son of W. Stuart Symington, Mr. Symington was educated in the public schools and at City College and spent the early part of his career as a teacher, entering the practice of law only in 1906.

He took the doctor of philosophy degree at Johns Hopkins University in 1901, majoring in Romance languages.

Following his graduation from the Hopkins, he went to the Leland-Stanford University, in California, where he taught for several years, going from there to Amherst, where he taught Romance language for seven years.

Leaving Amherst, he went to Columbia University Law School, where he studied law for two years, leaving there to return to Baltimore and complete his law studies in the Law School of the University of Maryland, from which he graduated in 1906. He was admitted to the Baltimore bar in the same year.

Much of his attention after he began the practice of law was devoted to corporation law and especially to the interests of the Symington Company, manufacturers of railroad devices, of which his brothers were the officers.

When the United States entered the World War Mr. Symington attempted to enter the ranks of a fighting arm of the United States Army. He was rejected after a physical examination.

He then turned his attention to such patriotic work as he could do outside the army. In 1919, at a meeting in Cleveland, he was elected president of the Association of Manufacturers of War Materials.

One of his activities during the war was to organize a $6,000,000 unit of the Symington Company in Chicago for the manufacture of 155-millimeter shells. He was the president of this unit. It had just been completed when the war ended.

Bought Gibson Island.

About 1921 Mr. Symington bought Gibson Island, an island in the Chesapeake Bay off the mouth of the Magothy river. He organized the Gibson Island Club and subsequently organized the Gibson Island Company. He was president of both organizations.

In August, 1924, Gov. Albert C. Ritchie appointed Mr. Symington a member of the Supreme Bench, succeeding Judge James M. Ambler, whose term of office had expired.

Throughout his life Judge Symington was interested in tennis, squash and other athletic sports. He is said to have been an unusually able tennis player.

Was On B. C. C. Board.

He was formerly one of the members of the Baltimore Country Club, serving for a time as a member of the board of governors of that organization, but retiring when he went to Gibson Island.

He was a member of the Maryland Club.

Widow Survives.

Surviving Mr. Symington are his widow, who before her marriage was Miss Emily Harrison, and the following children: Mrs. Louise Symington Orrick, W. Stuart Symington 3d, Francis Fife Symington, Charles H. Symington and James Symington.

He also leaves the following brothers: Thomas H. Symington, Capt. Powers Symington, U. S. N., recently retired; John F. Symington of S., Donald L. Symington and Charles J. Symington.

There also is a sister, Mrs. Lelia S. Goode.

Arrangements for the funeral have not been completed. It is expected that it will take place from Mount Calvary Protestant Episcopal Church.

Son of **William Stuart Symington I (born 1839)** (Co-Founder of the **Davison, Symington and Company** - Which was the name of the **Davison Chemical Company** in the late 1800s.)

Born Oct 6 1872 (https://www.findagrave.com/memorial/11415454/powers-symington)

1902(?) -Powers Symington works on Continuous Aim Fire tech

Source : US Naval Institute - Naval History Magazine / April 2015 Naval History Magazine Volume 29, Number 2 / "Continuous-Aim Fire: Learning How to Shoot " By Lieutenant Commander Benjamin F. Armstrong, U.S. Navy . See [HP0009][GDrive]

"In November 1900, Lieutenant William Sims joined the wardroom of the Kentucky, the U.S. Navy's newest battleship. He had just come from a tour as an attaché at the American Embassy in Paris, where he had been studying and collecting intelligence on European battleship design and gunnery practices. As the Kentucky sailed to China Station, Sims got his sea legs back after three years on shore duty. He also studied his new ship and started comparing what he had observed in Europe with what he found back at sea with his shipmates. That led him to conclude that despite new ships and newfound importance, the U.S. Navy still had a lot of room for improvement.

While visiting Hong Kong, Sims had a chance encounter with a Royal Navy captain who opened his eyes to a way he could help improve American naval standing. Percy Scott was the commander of the protected cruiser HMS Terrible, and what the lieutenant discovered was the British captain's new gunnery technique of continuous-aim fire. It was a revolutionary change to naval gunnery that virtually nobody in the Royal Navy was taking seriously. Sims saw it for what it was: a chance to change naval warfare forever.

On board his previous ship, the cruiser Scylla, and again in the Terrible, Scott regeared the elevation mechanisms on his big guns and added telescopic sights. The latter allowed gun directors to see the enemy at the extreme ranges naval guns were achieving at the turn of the century. Maximizing the gearing allowed the directors to constantly adjust the barrels of the guns as the ship moved. This allowed them to keep the guns continuously aimed at the enemy, rather than waiting for the rolling of the ship to put the enemy in the crosshairs. Gun crews could not only shoot more accurately but also fire as quickly as they could reload the giant guns.

Sims watched gunnery practice on board the Terrible and learned how the British had improved their accuracy by an order of magnitude while nearly quadrupling their rate of fire. The work of one ship could have the destructive potential of a squadron of ships still using the old methods. Despite the fact that the Royal Navy didn't seem interested in Scott's innovation, Sims immediately took it back to the U.S. Asiatic Squadron and began tinkering with the gearing of its ships' guns and training crews in the new techniques. Having worked as an intelligence collector and analyst while in Europe, he immediately wrote a report that he sent back to the Bureau of Ordnance (BuOrd) in Washington, D.C.

But the bureau didn't appear to believe the report; its claims seemed too extreme. Instead BuOrd stowed the report away in a basement file cabinet at the Washington Navy Yard. Sims heard nothing. However, he continued to develop and improve the continuous-aim fire techniques—adjusting the gearing, working with the gun crews to develop training methods, and writing papers on all of his findings.

Over the course of two years Sims wrote 13 reports, all of which were sent to the bureau. Many of them had the endorsements of captains on China Station and even Rear Admiral George Remy, who commanded the squadron. They had seen the results. However, the Bureau of Ordnance still didn't believe the success Sims claimed to achieve. It decided to run its own test to prove he was wrong.

The bureau's experts used a gun mounted on the banks of the Anacostia River at the Washington Navy Yard; their report stated that what the lieutenant in the Pacific was claiming was impossible. Of course they hadn't changed the gearing of the gun, as Sims' reports instructed, and they tested the technique on dry land instead of on the rolling deck of a ship, which changed the physics. But the Navy stood by its report, and the official policy was that continuous-aim fire was impossible.

Sims, after two years of developing the procedures and writing the reports, was understandably frustrated. As a result he did something he later admitted was "the rankest kind of insubordination." Sims wrote a letter directly to President Theodore Roosevelt.

Roosevelt, a knowledgeable student of naval affairs and former assistant secretary of the Navy, read the letter and realized that if what Sims claimed was actually possible it would have significant ramifications. He suggested the Bureau of Navigation fill the relatively obscure billet of "inspector of target practice" by bringing Sims home from China Station. Even if continuous-aim fire didn't work, American naval gunnery was so poor it was worth taking the chance.

Sims returned to Washington and took on his new position with the tenacity of a blue crab grabbing a chicken bone. Given two junior lieutenants to serve as his assistants, Ridley McLean and ***Powers Symington****, he began revolutionizing gunnery in the U.S. Navy. They started by circulating the procedures for continuous-aim fire and instituting mandatory gunnery practice for all ships. They also initiated an annual gunnery competition involving every ship in the Fleet. The winner would be announced in the newspapers of the day and have the honor of being known as the best ship in the Navy. Also, the gunnery officer in the winning ship was required to write a report on how his ship won. The reports were circulated to U.S. wardrooms all around the world, and consequently, gunnery methods and techniques were constantly refined.*

Sims was promoted to lieutenant commander and traveled the world to visit ships and help train gun crews. In the span of just a few years he and his team changed naval warfare forever. The system they introduced increased the speed with which American gunners hit their targets by 100 percent and the effectiveness of American batteries by 500 percent. U.S. sailors became some of the best gunners in the world and led a revolution in naval affairs. Subsequent innovations included fire control and the all-big-gun battleship, or dreadnought. Throughout the Fleet, William Sims became known as "the man who taught us how to shoot."

Sims continued pushing boundaries in the years leading up to World War I—advocating for all-big-gun battleships, developing torpedo-boat destroyer tactics, and eventually commanding all American naval forces in England when the United States entered the war. During the conflict he was central to the adoption of the convoy system that won the First Battle of the Atlantic. When he returned home he served a second term as president of the Naval War College, where he helped establish the system of study and war-gaming used throughout the interwar years to develop American naval aviation and submarines.

Naval innovation is too often seen through the lens of technology, defined by the weapons and hardware we label as "game-changers" or "transformations." However, some of the most important developments in history have come from the "software": innovations in tactics, techniques, and procedures such as the development of continuous-aim fire. Ideas, it must be remembered, can be even more powerful than the steel and explosives that dominate our naval history."

1905 (Dec) - Best man at wedding

Also in attendance - **William Kern Gise (born 1871)** .

The Washington Post (Washington, District of Columbia) · 29 Oct 1905, Sun · Page 166

Miss Anita Evans, daughter of the former consul general to London, will be married at noon on Wednesday to Lieut. David Foote Sellers, U. S. N. The ceremony will take place in St. Thomas' Episcopal Church and will be followed by breakfast for the bridal party only in the home of the bride's parents, on Massachusetts avenue. The family is in mourning for the bride's brother, Lieut. Evans, otherwise there would have been more festivity on this occasion. The bride's sister, Miss Evans, will be her only attendant. The best man will be Lieut. Powell Symington and the ushers will be Lieut. Commander Gibbons, of the Dolphin; Capt. Archibald Butt, Paymaster Izard, Lieut. Roscoe Spear, Capt. Harry Lay, and Lieut. William K. Gise. The wedding will be a brilliant one, as all navy weddings are sure to be The officers will wear full-dress uniform and the guests will be from among the most distinguished official and army and navy families in the city.

BALTIMORE, THURSDAY MORNING, JUNE 13, 1912.

Cemetery.

FUNERAL OF MAJOR SYMINGTON

Floral Design From President And Mrs. Taft On Grave.

A design from President and Mrs. Taft was among the many flowers placed upon the grave of Major W. Stuart Symington, who was buried yesterday afternoon in Greenmount Cemetery. Commander Powers Symington, of the President's yacht Mayflower, is a son of Major Symington. Out of respect for him and in honor of his father, Bugler J. W. Ivy, of the Mayflower, was sent to Baltimore to sound taps over Major Symington's grave. The officers and men of the yacht also sent flowers.

Brief funeral services were held at the home of Major Symington's son, Mr. Thomas H. Symington, 218 Ridgewood road, Roland Park, after which the body was taken to St. David's Protestant Episcopal Church, where services were conducted by the Rev. Dr. William M. Dame, rector of Memorial Protestant Episcopal Church; the Rev. W. H. H. Powers, of Towson, and Rev. Theodore C. Foote, of St. David's.

The pallbearers were T. H. Symington, W. S. Symington, Jr., Commander Powers Symington, John F. Symington of S., E. H. Symington, Donald Symington and Charles J. Symington, all sons of Major Symington, and a half-brother, Mr. John F. Symington. The casket was draped with the Confederate flag. The honorary pallbearers were:

Messrs.—

George W. Booth,	J. Livingston Minis,
J. Southgate Lemmon,	Michael Jenkins,
Frederick M. Colston,	Rufus W. Applegarth,
Gustav Lurman,	D. William H. Welch,
Randolph Barton,	Frank Brown,
J. McKenny White,	Gen. Felix Agnus,
Albert Marburg,	Ewing Harvey,
William H. Graffiin,	James R. Wheeler,
C. D. Langhorne,	George C. Jenkins,
Charles W. Field,	Andrew C. Trippe,
Joseph W. Jenkins,	A. R. H. Ranson,
McHenry Howard,	Dr. Delano Fitzgerald,
R. Curzon Hoffman,	Key Compton,
Charles H. Grasty,	Frank H. Hambleton,
Yates Pennington,	George May,
Charles T. Crane,	Capt. Neilson Poe,
Joseph Packard,	Spalding L. Jenkins.
J. H. Cottman,	

Among those present at the services at the church were:

Messrs.—

Gen. James R. Wheeler,	J. H. S. Compton,
Gen. L. L. Jackson,	Richard B. Post,
Major P. P. Dandridge,	Walter Warren,
Ex-Congressman Denny,	Dr. George Reuling,
Capt. H. A. Wise,	Charles S. Winder,
Col. Washington Bowie,	Ral Parr,
Prof. C. F. Raddatz,	Dr. Sidney Cone.
Felix V. Brainer,	Dr. Samuel C. Chew,
Robert C. Cole,	Prof. B. L. Gildersleeve,
Bartlett S. Johnston,	Col. D. G. McIntosh,
William J. Ewing,	Judge J. P. Gorter,
Clymer Whyte,	James McC. Trippe.
George S. Jackson,	

They Mourn Major Symington.

The board of directors of the Baltimore Mutual Fire Insurance Company at a special meeting held yesterday passed resolutions regretting the death of Major W. Stuart Symington. Major Symington was one of the incorporators of the company in 1885 and was its president from 1886 to 1887. Major Symington had held no office with the company for a number of years, but always maintained a friendly interest in it and with its executive officers.

The resolutions conclude with the following paragraph: "We have all lost a courteous, gallant friend—and Baltimore can mourn the loss of a citizen of the very highest type—and we respectfully convey our sympathies to the family."

SOCIETY

Mr. And Mrs. Alexander Brown Will Entertain At Dinner This Evening For Mr. And Mrs. Aldrich, Of New York, With Dancing To Follow.

Capt. Powers Symington, Naval Attache Of The American Embassy In London, Was Presented To King George Tuesday At The First Levee Of The Season.

NOT for several years has the ballroom of Mr. and Mrs. Alexander Brown been open so often as this winter.

The ball given by them for Miss Sara Bell Williams was one of the most brilliant of the season, and several smaller dances have been given there. Tonight Mr. and Mrs. Brown will give a dinner-dance for Mr. and Mrs. Aldrich, of New York.

The guests will be seated at four tables of about 10 each, with centrepieces of golden baskets filled with spring flowers. After dinner there will be dancing for several hours. Mrs. Brown is resuming her leadership, much to the pleasure of society, in which she has always been a power.

The guests this evening will include Mr. and Mrs. Sherlock Swan, Mr. and Mrs. W. S. G. Williams, Mr. and Mrs. N. Winslow Williams, Mr. and Mrs. Ral Parr, Mr. and Mrs. J. Swan Frick, Judge and Mrs. James P. Gorter, Mr. and Mrs. T. O'Donnell Hillen, Miss Virginia Latrobe, Miss Bessie Buckler, Mr. Percy B. McLaran, Mr. Ewing Harvey, Mr. Græme Turnbull, Mr. Oscar G. Murray and Mr. Ross Winans Whistler.

CAPT. POWERS SYMINGTON, the naval ttache of the American Embassy in London, who succeeded Capt. Edward Simpson, was presented to King George day before yesterday at the first levee of the season at Buckingham Palace.

A levee differs from a court in that only gentlemen are present, the presentations being to the King, while at a court both ladies and gentlemen are presented to their Majesties.

In England people in society are always spoken of as "ladies and gentlemen"—never as "men and women." Picture a host saying after a London dinner party "Let us join the women in the drawing room"!

Captain Symington, who is a son of the late Major Stuart Symington, of Baltimore, and one of the six brothers of that name, is delightfully situated in a flat in Park Lane, the most beautiful and exclusive street in London facing Hyde Park. He is going out a great deal, and has made no end of friends in England. His niece, Miss Clare Goode, one of this season's most charming debutantes, will join him in June and will be presented at court.

The London season, quite contrary to the American one, mildly begins in February, just as the Baltimore one is ending, and reaches its height in May and June.

MR. VIRGIL HILLYER and Mr. Evelyn Harrison, having arrived in San Francisco, are sailing from that port today for Honolulu on their tour around the world. They have mapped out a most interesting itinerary, with Japan, China, India and Europe to follow in succession. They will not return until late next summer.

Mr. Edwin Warfield, Jr., and Mr. Thomas Swan, who are also going around the world, have recently been in Ceylon and are now in India.

COMMANDER BENOIST D'AZY, naval attache of the French Embassy in Washington, and Viscountess d'Azy will be the guests of honor at a small dinner given this evening by Mr. and Mrs. Douglas Huntly Gordon at their residence, 1009 North Calvert street, the other guests to include Mr. and Mrs. T. Nelson Strother, Miss Anita Tunstall Smith and Mr. John Philip Hill.

MRS. R. SNOWDEN ANDREWS and her granddaughters, Misses Anita and Marion Tunstall Smith, will sail in April for London and will occupy, as they have for several years, their flat in Chelsea, a delightful old part of London, near the Thames, filled with historic houses and gardens. There Mrs. Henry Bacon, the daughter of Mrs. Andrews, will join them for the season. Mrs. Forster-Cooper, another granddaughter of Mrs. Andrews, formerly Miss Rosalie Tunstall Smith, who, with Mr. Forster-Cooper, has been at a series of house parties, has returned to Cambridge, England, where they have an establishment.

RETURNING to Pittsburgh today was Miss Betty Wood, who has been visiting the Misses Gittings at their home, 613 St. Paul street.

MISS REBECCA DULANY BEVERLEY, of Virginia, is visiting her aunt, Mrs. Harry S. Belt, at her residence, 107 West Lanvale street.

AN interesting marriage to take place in June will be that of Miss Virginia Greenway Albert, daughter of Mr. and Mrs. Jacob Albert and granddaughter of Mrs. J. Henry Greenway, of Hokeland, Harford county, Md., and Mr. William Howard Hamilton, son of Mrs. Hamilton and the late Matthew Allan Hamilton and grandson of Mr. Archibald Alexander Austin, of North Carolina.

MR. IRWIN B. LAUGHLIN, charge d'affaires of the United States Embassy, and Mrs. Laughlin gave a dinner at 15 Great Stanhope street, London, last night for Mr. Walter H. Page, the new Ambassador. The Baltimoreans present included Mr. J. Ridgely Carter, once Minister to Roumania, and Mrs. Carter and Capt. Powers Symington, naval attache of the American Embassy. Other guests were Sir Edward Grey, Lord and Lady Sandhurst, Mr. and Mrs. Louis Harcourt, the Hon. Aubrey Pauncefote, Sir William and Lady Tyrrell, Consul-General and Mrs. Griffiths and Mr. and Mrs. Humphry Ward.

1914 (jan 18) - lost submarine

[HN005T][GDrive]

1914-01-18-the-baltimore-sun-pg-1-clip-sub

NO TRACE OF SUBMARINE

Destroyers With Weighted Cables Sweep Bay Bottom In Vain.

LIFTING BOAT IS DUE TODAY

But Even If Found, Little Craft Can't Be Raised Till Tomorrow. Hope For Men Long Abandoned.

Plymouth, Jan. 17.—An all-day search by a fleet of torpedo boats, to which were attached cables for sweeping the bottom of Whitesand Bay, near here, failed to locate the sunken British submarine A7.

When darkness fell the commanding officer reluctantly ordered the vessels to return to their moorings.

Although hope of any of the crew being alive was long ago given up—six hours being the maximum time they could breathe after the ship sank—the search will be resumed at daylight.

The work of locating the craft has been made more difficult by the fact that the buoy which the parent ship placed when the submarine was missed was driven out to sea and it is believed that the submarine itself drifted and probably lies at a depth of 30 fathoms.

On Watch All Night.

A destroyer kept watch throughout last night over the spot where the tiny vessel was supposed to have disappeared after her dive during the maneuvers yesterday morning. With the first streak of light at dawn a number of destroyers, with weighted cables stretched between them, steamed up and down the bay sweeping the bottom of the sea, but encountered no obstacle.

The lifting craft specially fitted for raising sunken submarines cannot reach the scene of the disaster before Sunday night and the authorities say that there is small chance of raising the boat before Monday, even if she should be located.

Many Theories As To Cause.

Many theories have been put forward to account for the accident. The A7, with A9, had been ordered to attack a destroyer with torpedoes. The A9 fired hers, but the A7 did not.

Nothing has been heard of the A7 since and it is believed that the machinery got out of order or the men were overcome by gas.

A7 was one of only three vessels of her class remaining in the regular flotilla. The others are being utilized for purposes of instruction.

Commander Powers Symington, naval attache of the American Embassy, called at the Admiralty today to express regret in behalf of the Navy Department.

Lieut. Gilbert Molesworth Welman, who commanded the A7, was the nephew of Lady Molesworth, who died September 26 last from the sting of a wasp, and succeeded to her Trewarthenic estate in Cornwall.

More Than 200 Lives Lost.

The loss of the British submarine boat calls attention to the heavy loss of life sustained since these diving boats have been attached to the great navies of the world.

Submarine accidents in the different navies have caused the loss of more than 200 lives during the last 10 years. Collisions and explosions on board and the inrush of water through all the open ports have been the common causes of these mishaps.

The navies of France, Great Britain and Russia have been the principal sufferers in the number of lives lost. In five serious accidents France has lost 82 officers and men. Great Britain, whose submarines have given that country the most serious trouble, has lost 77 men.

The American Navy has had a few submarine accidents, but the loss of life was small compared to those which have befallen the French and British navies.

THE LEAVENWORTH TIMES, SATURDAY MORNING, AUGUST 22, 1914

HUGE TASK AHEAD FOR ATTACHES IN EUROPE CONFLICT

American Army and Navy Officers in Various Countries to Keep Tab on Developments.

SPECIALLY TRAINED OBSERVER

Military Attache Is Not Chosen for Looks, but for Ability—Must Watch Carefully for New Inventions and Methods.

Washington, Aug. 21.—During the present European crisis there is no class of men to whom the American public's interest is more deeply attached than the officers of our army and navy who are serving as attaches to our various embassies in the belligerent countries.

In the old days a military or naval attache at a European court was chosen for two reasons—because he was especially handsome in his dress uniform and was able to afford the expense through his private means, or because he was a personal friend of the American ambassador serving at the capital to which he was assigned.

Now things are different. In addition to being a trained courtier, who will be able to take his place with credit to his country in any gathering, whether of business men or crowned heads, he must be a specially trained military observer, capable of obtaining information for the use of the home government on all new military features which may be introduced.

WILL BE KEPT BUSY.

Maj. George T. Langhorne, a Kentuckian, who is looking after our military interests at Berlin, has his hands full. Though a cavalry officer himself, he must pay attention to every different branch of the military service with which Germany is making her struggle against the allies. For instance, he must report, in as detailed a manner as possible, upon the types of military automobile with which Germany has been conducting her advance guard attack.

This will include a separate report upon the type of motor used, its speed on good roads, its ability to travel over rough ground, whether it is armored effectively, whether it carries a rapid fire gun and, summing up, whether its use has been a success. In the advance through Belgium, Germany used a new form side by an advance guard of automobiles. These machines carried light rapid-fire guns, which gave them an attacking strength.

With the light artillery they carried, the outposts of the enemy could easily be brushed away, while the troop trains following only a few yards behind gave the support needed in case a heavier column of the enemy appeared.

MUST GIVE RESULTS.

Upon each and every detail of this work Major Langhorne must be able to report, and upon his views, as well as upon the results which have been obtained, will depend the action which our war college experts will take. Another feature of the German army's work which Major Langhorne must watch with special attention will be the use of dirigible airships.

A modern military dirigble costs at least $500,000. Its maximum life at the best is short, being generally estimated at about four years. In time of war, it presents so large a target that it is only safe from the bullets of the enemy when many thousand feet in the air, and then it may be liable to destruction from a chance shrapnel shot or from the aeroplanes of the enemy. As the result of this it will mainly be used for night attacks, sailing over the enemy's fortifications and dropping bombs containing hundreds of pouds of explosives as near as possible to powder magazines, according to some. Through the watchfulness of our military attache in Berlin the American army officers must be able to know whether it will pay our government to construct machines of this type.

Maj. Spencer Cosby, from Maryland, who is serving at Paris, will have his specialties to handle. In Aeronautics the French army without question leads the world as far as aeroplanes go. Major Cosby will also have an interesting report to make on the wonderful French artillery.

FRENCH ARTILLERY.

It is on this branch of her service that France places its great reliance. Her infantry is weak, according to some officers, the men being young and not comparing at all favorably with the infantry of the German service, but in field artillery France has reached a state of near perfection.

Transportation of troops is likely to be the most important feature upon which Lieut. Col. George O. Squier, the American military attache at London, will report. With the German army busy in its attacks upon Russia, it appears hardly likely than an invansion of Great Britain can be attempted, and for this reason the British troops are likely to be sent to the continent, there to aid in repelling the German attacks. The handling of these troops, both by sea and rail is something which England has brought down to a fine system, having learned her lesson during the Boer War.

most difficult of tasks accomplished if he is able to report fully to Washington on the most important branch of the French navy. While France is well supplied with battleships and torpedo boat destroyers as well as with fast cruisers, she has made the submarine her especial pet.

Russia, Italy and Austria are also being watched by our army and navy men abroad. In the first named country, Lieut. Commander Major will cover the naval end of the work as well as that of France, while no army officer is designated to remain at St. Petersburg. In Austria-Hungary Capt. Allan T. Briggs of Connecticut represents our army, and Lieut. Commander Richard D. White the navy, the last named officer also being given the duty of looking after Italian naval affairs. He is a Missourian by birth. Col. George M. Dunn of Indiana is the United States military attache at Rome.

of attack, massing her troops on trains which were flanked on each

Perhaps the most interesting experience that will be had by any of our military attaches will be that of Lieut. Sherman Miles, whose work lies between the two little governments of Servia and Montegro. This young man, whose father, Gen. Nelson Miles, is the ranking retired officer of the American army, will have an opportunity of observing the most interesting kind of warfare, taking place in a mountainous country.

England, with her tremendous force of superdreadnoughts, will be closely watched by Commander Powers Symington, U. S. N., attached to the London embassy with Ambassador Page. If this type of vessel shows its superiority, it stands to reason that the United States must go on building these $9,000,000 monsters, in order to defend her enormous coast line.

On the other hand Germany has pinned her faith to the support which she will give her battleship fleet from the finest fleet of torpedo destroyers in the world. For years past Germany has been doing her best to bring this branch of her service to a state of perfection and has come very close to obtaining the object sought. She has over 150 vessels of this type, all capable of making thirty knots per hour or more and has placed the finest officers of her navy on this work. Germany for years past has been holding night maneuvers of her torpedo destroyers in fleet formation, running the vessels at top speed without a light showing. This is something that no other nation has dared to attempt.

OLD SOLDIER'S SON.

Lieut. Commander Walter R. Gherardi, who claims Hawaii as his birthplace, will watch this work for the United States, and it is quite possible that his reports may result in limiting the superdreadnought construction in favor of a mosquito fleet, small in tonnage, but mighty in numbers and destructiveness.

Lieut. Commander Samuel I. M. Major, U. S. N., will have one of the

[HN005W][GDrive]

1914 (Aug 28)

[HN005X][GDrive]

NEARING NATIVE SHORE

Many Baltimoreans To Arrive This Week From War-Torn Europe.

DR. BLOODGOOD AMONG THEM

Mrs. W. Stuart Symington, Jr., And Children Safe In Switzerland — Others Are Heard From.

With the arrival of several large steamers from England within the next two days, the majority of Baltimoreans will have gotten out of the trouble zone and landed on their native shores. The Adriatic, the Olympic, the St. Paul and the San Giovanni are due within the next 48 hours in New York.

Among those who will land will be Dr. Joseph C. Bloodgood, who attended the surgical congress in London. Dr. F. P. Mall, of the Johns Hopkins Medical School; Dr. W. W. Willoughby and Dr. J. W. Bright, of the university, are still in London and are expected to sail soon.

Misses Ella and Mary Kremelberg, sisters of Mrs. John Gill, Jr., are still in London and have not informed relatives here their intention to sail. They were in Paris when the war started, but made a hurried dash to London.

Mrs. Ral Parr and Mrs. Donnell Swann likely will sail within a day or two for New York.

Mr. and Mrs. Charles C. Homer and Dr. and Mrs. H. L. Homer, who are in Bremen, are not expected to be able to reach London for a week or more.

Mr. and Mrs. Charles Kreuder, parents of Charles Kreuder, Jr., an assessor for the Appeal Tax Court, are still at Hanau, Germany, according to a message to their son. They are with relatives, but the police are watching them closely, and it is believed that they will be held until the mobilization period is over.

Mr. Kirwan Helped Charter Ship.

George W. Kirwan, who reached New York from Italy on a chartered steamer, was at his office yesterday and expressed pleasure that he had been able to reach his native land without having to pass through the warring countries. He was one of the most energetic of the Americans who arranged for the charter of the steamer and saw to it that those unable to pay their share of the charter price were not left behind. Miss Cora Thomas was the only other Baltimorean on the ship.

Friends of Mrs. W. Stuart Symington, Jr., and her six children were relieved from their great anxiety yesterday when Mr. Symington announced that he had received a letter from his wife and their six children and that they were safe in Switzerland. Her brother-in-law, Lieut.-Com. Powers Symington, U. S. N., now naval attache at the London Embassy, has sent her word to remain in Switzerland until he can accompany her out. In her letter Mrs. Symington says that all the Swiss male population is at the border under arms and that she had great difficulty cashing checks in Luzerne.

Miss Polly Carter, who is in London, has written to her friends, saying that the English are keeping calm and collected and that every person seems more than anxious to do his duty, whether it be on the firing line or at home.

School Teachers Heard From.

Miss Caroline Becker, Miss Harriett Ebaugh, Miss Rose O. Wickes and Miss Mary Robinson, public school teachers, notified friends yesterday by cable that they would sail from Liverpool September 19. They will not reach here until long after school opens, but it is believed that the School Board will overlook this in view of the difficulties travelers are now encountering.

Mr. and Mrs. Abraham Fader have reached the United States through Canada, but will not return home until Monday next.

Miss Margaret Kerr, daughter of Mrs. Richard P. Baer, of Catonsville, arrived yesterday morning at her home on Frederick road, from Europe after some thrilling experiences in the war zone. Miss Kerr landed at New York Wednesday from the steamship Cameronia from Glasgow, and was accompanied by Miss Jane Byrne, director of the Lawrence House Settlement.

When the first talk of war spread over Europe they were in Germany and left immediately for England and Scotland. They had intended sailing on the Caledonia from Glasgow about two weeks ago, but the sailing of the steamer was postponed.

Messrs. Walter L. Read and Leo C. Read, of Eden Terrace, Catonsville, who spent the summer traveling abroad, have sailed from Italy to Liverpool, whence they will take passage for home as soon as possible.

Mr. and Mrs. Sidney Lansburgh, who have been in Lucerne, Switzerland, since war was declared, are now at The Hague and have cabled they will sail Saturday on the steamer Rotterdam from Rotterdam.

Mrs. William Hatton, matron, and her daughter, Miss Mabel Hatton, teacher at the Episcopal Church Orphan House, Frederick, Md., who are in Europe, have written to friends that they are uncertain when they will be able to return.

Mr. and Mrs. Edw. L. Rich, of Richland, Catonsville, have received word from their cousin, Miss Harriet Tyler, who is spending the summer traveling abroad, that she is in Scotland and the pleasure of her trip is in no way being married by the war.

Mrs. Severn R. Allnutt, of Catonsville, yesterday received a cablegram from her sister, Miss Ethel H. Crosby, president of the Woman's Civic League of Catonsville, who spent the summer at Malaga, Spain, with her cousin, R. F. Bevan, announcing her departure for home. Miss Crosby sailed Wednesday from Cadiz, Spain, on the steamer Isabella.

Misses Eisenbrandt In Frankfort.

A report of the safety of a large party of Baltimoreans who have been traveling together was received yesterday by Former City Councilman William A. Eisenbrandt from the State Department in Washington. He was informed that his daughters, Misses Jeannette and Alice Eisenbrandt; their cousin, Miss Marie Eisenbrandt, and aunt, Miss Alice Schulz, were in Frankfort, all safe and well and amply provided with funds. They are to leave Frankfort today for Holland, and expect to sail for home on September 12.

In the party are Mr. and Mrs. Charles S. Stauffen and their son, Charles K. Stauffen; Mr. and Mrs. Frederick Denhardt William Caspari, H. A. Schwartz and W. Caspari Wylie.

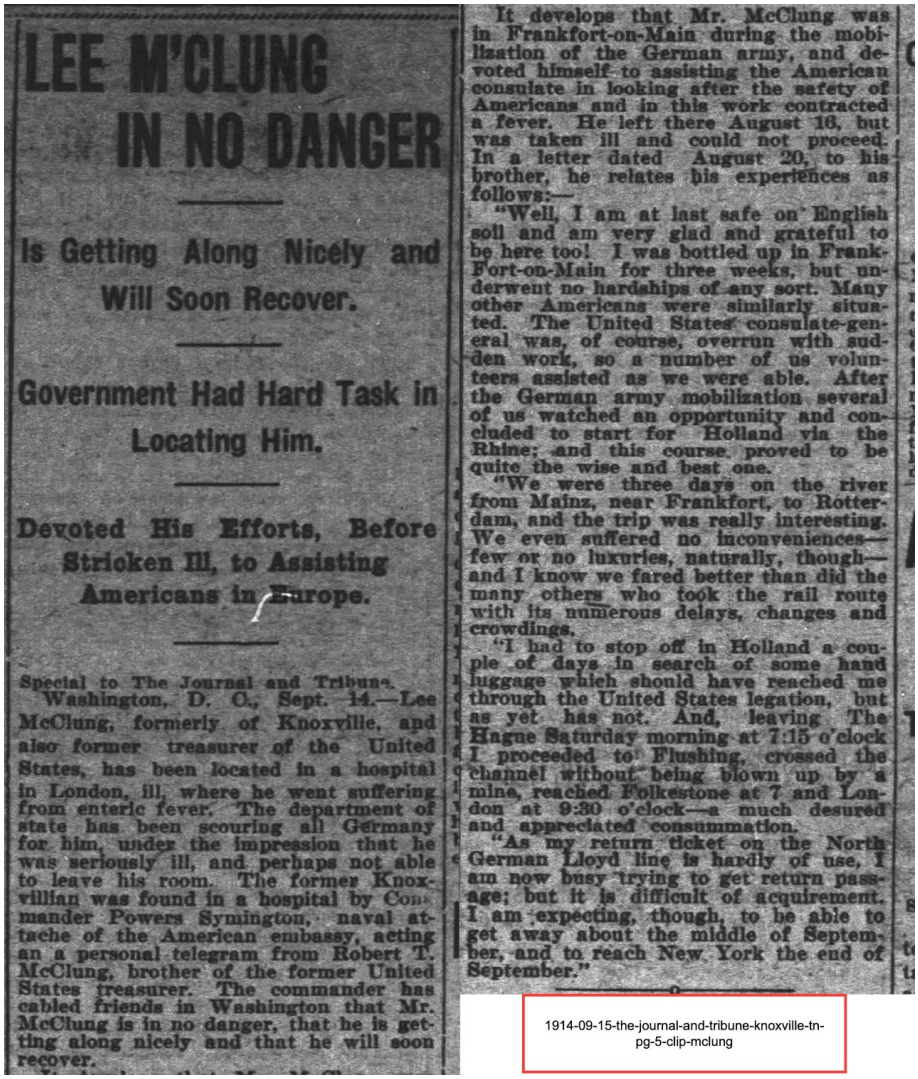
[HN005Z][GDrive]



LEE M'CLUNG IN NO DANGER

Is Getting Along Nicely and Will Soon Recover.

Government Had Hard Task in Locating Him.

Devoted His Efforts, Before Stricken Ill, to Assisting Americans in Europe.

Special to The Journal and Tribune.

Washington, D. C., Sept. 14.—Lee McClung, formerly of Knoxville, and also former treasurer of the United States, has been located in a hospital in London, ill, where he went suffering from enteric fever. The department of state has been scouring all Germany for him, under the impression that he was seriously ill, and perhaps not able to leave his room. The former Knoxvillian was found in a hospital by Commander Powers Symington, naval attache of the American embassy, acting an a personal telegram from Robert T. McClung, brother of the former United States treasurer. The commander has cabled friends in Washington that Mr. McClung is in no danger, that he is getting along nicely and that he will soon recover.

It develops that Mr. McClung was in Frankfort-on-Main during the mobilization of the German army, and devoted himself to assisting the American consulate in looking after the safety of Americans and in this work contracted a fever. He left there August 16, but was taken ill and could not proceed. In a letter dated August 20, to his brother, he relates his experiences as follows:—

"Well, I am at last safe on English soil and am very glad and grateful to be here too! I was bottled up in Frankfort-on-Main for three weeks, but underwent no hardships of any sort. Many other Americans were similarly situated. The United States consulate-general was, of course, overrun with sudden work, so a number of us volunteers assisted as we were able. After the German army mobilization several of us watched an opportunity and concluded to start for Holland via the Rhine; and this course proved to be quite the wise and best one.

"We were three days on the river from Mainz, near Frankfort, to Rotterdam, and the trip was really interesting. We even suffered no inconveniences—few or no luxuries, naturally, though—and I know we fared better than did the many others who took the rail route with its numerous delays, changes and crowdings.

"I had to stop off in Holland a couple of days in search of some hand luggage which should have reached me through the United States legation, but as yet has not. And, leaving The Hague Saturday morning at 7:15 o'clock I proceeded to Flushing, crossed the channel without being blown up by a mine, reached Folkestone at 7 and London at 9:30 o'clock—a much desured and appreciated consummation.

"As my return ticket on the North German Lloyd line is hardly of use, I am now busy trying to get return passage; but it is difficult of acquirement. I am expecting, though, to be able to get away about the middle of September, and to reach New York the end of September."

GREAT BRITAIN PLANNED TO CONTROL AT PANAMA

Had Arranged With Japan to Prevent Use of Canal by Germany In Time of War.

Washington, Feb. 23.—Discovery of an alleged agreement between Japan and Great Britain with reference to the Panama canal almost led to the dismissal by the British government of Commander Powers Symington, American naval attache in London, according to a report received here today. As it is, the report states a number of British officers with whom Commander Symington consorted have been disciplined.

It is not expected that the American officer will remain much longer in London.

According to the information obtained, Commander Symington learned that an arrangement had been reached by the British and Japanese governments whereby Japanese men-of-war were to watch the Pacific entrance of the canal and prevent its use by German cruisers. To facilitate the operations of the Japanese ships they were to be provided with a base at Vancouver, British Columbia.

Four Japanese cruisers have been steaming along the American Pacific coast and have been obtaining supplies from Vancouver. Their presence has been known in Washington for some time.

Commander Symington regarded the information he obtained as important and conveyed it to the American ambassador. The latter promptly brought it to the attention of Sir Edward Grey, British minister for foreign affairs. Sir Edward, according to the report, denied that there was any menace against the United States in the arrangement. When he learned the ambassador's source of information he promptly made inquiries. He learned with whom Symington has been associated, and these men were punished for the revelations.

U. S. EMBASSY IN LONDON IS A BUSY PLACE THESE DAYS

Affairs of Austria, Turkey and Germany Are in Hands of Page and His Assistants.

London, April 16.—(Correspondence of the Associated Press.)—Under stress of war, Germany, Austria-Hungary and Turkey have all entrusted their affairs in Great Britain to the American Embassy, thus piling an extraordinary burden upon Ambassador Page and making it necessary to enlarge the embassy staff. American affairs alone, with the thousands of controversies and claims arising from interrupted shipping and the stubborn citizenship cases encountered daily, would be troublesome enough. But in addition to these the American ambassador and his assistants are looking after the interests of thousands of Germans and Austrians interned in England and are entrusted with the business matters of enemies of England who cannot communicate with this island except through a neutral

1915-04-30-the-leavenworth-times-pg-9-clip-attache

agency.

William Buckner is the special attache of the embassy who is entrusted with Austrian and Turkish affairs. He maintains his office at the Austro-Hungarian embassy building in London, where he meets all inquirers and diverts from the American embassy a crowd which would be burdensome at this time when the embassy is frequently crowded with Americans seeking passports.

PASSPORT WORK.

German affairs are in charge of Edward G. Lowry, special attache, who has an office in the German embassy building. Mr. Lowry has just recently returned from Germany where he arranged for the distribution of gifts and comforts among Englishmen interned there, through the agency of American consuls. Leland Littlefield, who is a special attache of the embassy, is assisting in caring for German affairs.

At a time when travelers move between England and the continent with such difficulty the passport work of the embassy is especially arduous. Charles E. Stangeland, second secretary, is in charge of this department which demands his entire time, as well as that of several assistants.

Second Secretary J. Herbert Stabler is entrusted with the claims and controversies which arise from England's active campaign against shipping. This department of the embassy's work in growing heavier every day, because of England's aggressive policy under the order in council suppressing trade to and from Germany.

MUCH CODE WORK.

First Secretary Irwin Laughlin handles the diplomatic business of the embassy and is in constant conference with Ambassador Page. Second Secretary Edward Bell has charge of the general correspondence of the embassy, meets press representatives and visitors whose business cannot be referred directly to some special division of the embassy. Second Secretary Franklin M. Gunther, who was sent to London from Christiania on special duty, is Mr. Bell's assistant. Third Secretaries Elbridge Gerry Greene and Eugene C. Shoecraft and Howard N. Barnes, additional secretary detailed direct frof the State Department where he has had many years experience, are in charge of code work, now unusually heavy because of the frequent interchange of lengthy notes between England and the United States.

Sam B. Trissel and John T. Boifeullet are additional secretaries detailed to interview visitors and direct inquirers to the proper department. Clifford N. Carver is private secretary to Ambassador Page. Francis and Edward Hodson are resident clerks, sons of the late Charles Hodson, who was attached to the American Embassy for many years. The Hodson brothers are permanent employes of the embassy who have passed their entire lives in the service of the United States and are unfailing sources of information concerning diplomatic affairs in London.

MILITARY ATTACHES.

Commander Powers Symington is naval attache. Naval Constructor Louis B. McBride and Lieutenant John H. Towers, aviator, are also attached to the embassy. Lieutenant Colonel Thomas H. Treadwell of the marine corps is another attache. The army is represented at the London embassy by Lieutenant Colonel G. O. Squier and Lieutenant John G. Quekemeyer. Captains A. M. Miller and W. A. Castle of the army are at the embassy temporarily awaiting assignment with the British army as observers.

He is a Philadelphian and is in command of the American-Hawaiian liner Nebraskan, hit by either a mine or submarine's torpedo.

BIG BATTLE BETWEEN GERMANS AND ITALIANS EXPECTED AT TRENTINO

First Great Clash Imminent, With Strong Forces On Way.

ONLY TWO MILES APART

Advance Is Being Made Over Snowy Peaks In Alps A Mile High.

KING VICTOR CHEERS MEN

Taking Command, He Gives An Address, Declaring Kingdom Is To Redeem Territory.

Chiasso, Switzerland (on the Italian frontier), May 27.—The first great battle of the Austro-Italian war may be fought in the Trentino. The Italian Army is pushing steadily northward into the Tyrolean Alps, advancing over passes and snowy peaks a mile high.

In practically every instance the Austrian forces are fleeing without offering serious resistance and falling back upon the main body of the Austrian Trentino army. Advices received here today indicate that the Austrians are massed in great force in the Adige river section.

Strong Italian forces are being brought up to support the advance guard raiding the Trentino frontier district. Swiss military men believe a clash between the two main bodies may occur within a few days.

Berlin Hears The Same.

Berlin, via Copenhagen, May 27.—A big battle between Austrian and Italian armies along the Trentino border is imminent, according to dispatches from German correspondents with the Austrian Army.

The Austrian Army is strongly entrenched just inside the Trentino frontier, their outposts in constant clash with Italian scouting parties. Only two miles separate the two main forces.

King Victor In Command.

Rome, May 27.—King Victor Emmanuel arrived at the front today and assumed supreme command of the Italian armies that are pressing into Austrian territory along the entire frontier from Switzerland to the Adriatic Sea.

The King announced his assumption of the command with the following decree, issued as an order of the day:

"Soldiers: On land and sea the solemn hour of the vindication of our national claims has sounded.

"Following the example of my great ancestor, I assume today the supreme command of the land and sea forces, with sure confidence of victory which your valor, self-sacrifice and discipline will bring.

"The enemy whom you prepare to fight is seasoned and worthy of you. He is favored by the ground and by scientific preparation. He will offer ob-

Shepherd Has Gone To The Italian Frontier

By WILLIAM G. SHEPHERD.

Chiasso, Switzerland (on the Italian frontier), May 27.—Chiasso today is the busiest town of 4,000 in the world. For 48 hours hundreds of tourists have been flocking in—all bent on one mission. They hope to work their way northward along the border and see the expected Alpine clash between the Italian and Austrian armies.

It reminds you of the old days along the Rio Grande when the elite of El Paso crowded the river's edge to watch the Mexican factions shoot Juarez to pieces. But instead of El Paso policemen and soldiers from Fort Bliss to shoo back the crowds, the sturdy Swiss militiamen are on the job along the Swiss frontier. Their double business is to keep Italian and Austrian fighters from stepping over on Swiss soil and to keep spectators off the stage.

The crowds came by train, by automobile, on bicyles and in curious little carts. They included, of course, some correspondents, hot from the French and English battle fronts, who wanted to see what this new kind of a battle with different opponents would look like.

Refugees are flocking in daily—German and Austrian refugees from Italy and Italian refugees from Germany and Austria. Most of them bring wild tales of border battles and hairbreadth escapes from revengeful mobs. To date actual battle business has been poor along the Swiss frontier.

by a custom house guard, who killed an Austrian about to explode a mine at Cormons, it was announced today.

ITALY HOLDS CONSULS

Action Due To Detention By Austrians Of Six Italians.

Berlin, via The Hague, May 27.—The Italian police at Piacenza are holding six Austrian Consuls who were en route to the Austrian frontier, according to Vienna dispatches today.

The Piacenza authorities declare they seized the Austrian Consuls because the same number of Italian Consular representatives have been detained by Austria. Austria has officially denied this allegation.

Turkish Submarine Under Allied Fleet

Craft That Sank British Battleship Triumph Steamed Beneath Warships—About 500 Saved.

London, May 27.—The Turkish submarine which sank the British battleship Triumph in the Gulf of Saros off the northern shores of the Gallipoli Peninsula passed underneath the Anglo-French fleet in the Dardanelles when she steamed out to make the attack. The submarine steamed from a Turkish base between the Dardanelles Narrows and

COMMANDER SYMINGTON IS A BALTIMOREAN

Commander Symington, the United States naval attache at London, was appointed to duty at the embassy about three years ago. His commission to that post will expire in the fall, at which time he is expected to return to Baltimore.

He is 42 years old and was born in this city. In 1890 he graduated from the Naval Academy at Annapolis. In August, 1911, he was "commanded" by President Taft to assume the duties of skipper of the official Presidential yacht, the Mayflower. Previous to that, for a year or more, he had been on duty in the office of naval intelligence at Washington. His appointment as captain of the President's yacht relieved Commander George W. Logan, who relieved Commander Coontz as commandant of cadets at the Naval Academy.

Commander Symington has six brothers in this city—Thomas H. William Stuart, John Fife of S., Donald L. and Charles J. Symington—and one sister—Mrs. Lelia Symington Goode, of Guilford.

U. S. BATTLESHIPS DAMAGED

Georgia And Nebraska Come Together In Gale Off Newport.

Newport, May 27.—During the northwest gale last night the collier Cyclops dragged her moorings 20 fathoms, striking the battleship Virginia with such force as to loosen several plates on the collier. The battleship Georgia, to which the collier Orient was tied, dragged her anchors and struck the battleship Nebraska, ripping off her bridge and sinking her motor launch. The reported loss of life is now denied.

Mason Analyzes The New British Cabinet

By J. W. T. MASON.

New York, May 27, 11 A. M.—The formation of the coalition British Ministry is advantageous to the empire chiefly because it has broken the absolutist powers of Lord Kitchener. Hereafter the Minister for War will have no authority over the supply of munitions. David Lloyd-George, who has been transferred from the post of Chancellor of the Exchequer and is now the first Minister of Munitions, has become the most important member of the Government. To increase the ammunition supply is the chief creative work the Government has to do. The problem undid Kitchener's reputation as an organizer, and now a Democratic civilian comes forth to the task where the militarist and dictator failed.

If Lloyd-George succeeds at his new post, democracy will have won a great victory. The Minister of Munitions is the only democrat, as America knows the word, in the British Government. He has sprung from the people and is the people's spokesman and champion. He represents the highest type which the common people of Great Britain have yet reached. For Lloyd-George to fail now would mean British democracy had been unable to rise to the opportunity offered it. If Lloyd-George succeeds, his success will be democracy's own.

It is perhaps the most significant fact of the war that at this critical time in England's history she has appealed to a man of the people to come to her rescue. In the new coalition Cabinet are aristocrats, laborites, philosophers, members of the upper class, members of the middle class, members of the legal class, nonconformists, Unionists, militarists and one man who is above everything else the representative of democracy. To this man has been given the work of righting the ghastly errors of the past when the nation withheld ammunition from its field army and the Government refused to hearken to the artillery lessons of the war.

The chief executive burden of the war thus has passed from the militarists to the shoulders of democracy, and democracy is now, in reality, and for the first time, responsible for England's accomplishments in the war. This is the principal fact in the reconstruction of the Cabinet. Apart from Lloyd-George's appointment to the new Ministry of Munitions, the military consequences of the coalition Cabinet will be negligible. Mr. Balfour, the new First Lord of the Admiralty, has been assisting Winston Churchill from the outbreak of the war, and as a member of the committee of Imperial defense he has

Uncertainty May Make Attack On U. S. Ship An Unsolvable Mystery.

BALTIMOREAN TO DIRECT PROBE UPON ARRIVAL AT LIVERPOOL

London, May 27.—Two more steamships have fallen victims of German submarines.

The Danish steamer Betty, carrying a cargo of grain from Baltimore to Copenhagen, was torpedoed in the North Sea yesterday.

The British steamship Morwenna, of Montreal, was torpedoed off St. Anne's Head. After firing a torpedo at the ship's side the German submarine opened fire upon her, shelling the steamer for several minutes. One of her crew was killed and three wounded by shell fire. The remainder of the crew escaped in boats and after drifting for several hours were picked up by a Belgian trawler.

All of the crew of the Danish steamer were rescued and landed at Newcastle.

Liverpool, May 27.—The Nebraskan is scheduled to arrive in port at 9 o'clock tonight. Great crowds are awaiting the arrival of the American ship. Among the experts who will examine the hull of the Nebraskan are Lieutenant Towers and Naval Constructor McBride, attaches of the American Embassy in London.

Washington, May 27.—The State Department today received from Consul-General Skinner, London, the following:

"Greene, master of the American steamer Nebraskan, in wireless to me via Land's End, reports:

" 'Nebraskan passed Fastnet Rock Tuesday 4.33 P. M., from Liverpool, bound to Delaware Breakwater, in ballast.

" 'At 8.24 P. M., when the steamer was 48 miles west half south from Fastnet, she experienced a violent shock, followed instantly by a terrific explosion, bursting hatches and throwing hatch beam, cargo derrick and twisted iron into air and filling lower hold, forward, completely with water.

" 'Crew took to boats immediately. After standing by ship one hour they returned on board and started for Liverpool at 10.30 P. M.

" 'About 1.25 A. M. met two vessels sent by British Admiralty in answer to wireless call, and one has been in attendance ever since.

" 'It was dusk when explosion occurred.

" '*Flag had been hauled down five minutes before.*

" 'Steamer's name painted on both sides of ship in letters six feet tall.

" 'Had no warning and saw nothing.' "

To Administration officials this was the most significant sentence in the report.

It was taken as disclosing an uncertainty which promised to make the incident an unsolvable mystery.

If the ship was torpedoed by a submarine, it was agreed that the attack was an act of war. Officials admitted as much after examining precedents.

The United States had addressed a sharp note to Germany, it was pointed out, protesting against submarine warfare and flatly warning the Kaiser that we "could not be expected to do less than to use all of our powers" to protect Americans. If, with this note before his Government, a German submarine commander fired a torpedo at the Nebraskan, it was held that his act was one of belligerency and a direct assault upon the honor of the United States.

It was considered that, as yet, however, there was no evidence that this happened.

Green said frankly that he did not know whether a mine or a torpedo damaged his vessel. He and his men saw nothing, though for an hour after the explosion they floated in their boats on the open sea about the Nebraskan.

Hopeful It Was A Mine.

This was one of the principal reasons why officials were hopeful today that, despite the British Admiralty's declaration, it was a mine the American ship struck.

Realizing the extreme seriousness of the situation, the President has decided there will be no jumping at conclusions; the Admiralty's claim that Germans attacked the ship will not be accepted without proof.

The President is handling the case personally. All reports from the State Department's representatives abroad are sent direct to his study. Copies go to the other responsible officials. By the Presi-

dash will certainly defeat him.

On Sacred Natural Bounds.

"Soldiers, yours is the glory of hoisting the tricolor of Italy upon the sacred bounds which nature places as the confines of our country. Yours the glory of achieving the work undertaken with so much heroism by our fathers."

The offensive campaign of the Italian armies has opened auspiciously, but the Austrians, withdrawing slowly to their first line of trenches, are yet to strike their first blow. Their preparations are known to be complete, however, and even those most confident of the ultimate victory of the Italian forces admit that they will win only after desperate fighting.

900,000 In Opposing Armies.

It is, of course, impossible to state the strength of the Italian armies, but it is understood at the Italian War Office that the Austrian and German forces concentrated along the line where they will oppose the Italian campaign number about 900,000 men. Most of them are seasoned veterans from the western and eastern theatres of war.

First Shot By Customs Guard.

Rome, May 27.—The first shot in the Italian invasion of Austria was fired

the Sea of Marmora, which made it necessary for the underwater craft to make her way beneath the French and British warships, which are bombarding the Turkish forts on the Dardanelles and the Turkish land positions on the peninsula.

It is said unofficially that about 500 of the men on the Triumph were saved. The battleship carried a crew of about 700.

The battleship was struck in a vital part and sank in less than 10 minutes, which makes the saving of a majority of her crew an outstanding feature of the operation.

MAY WHEAT TUMBLES

Persistent Selling Sends Price Down To $1.44¼.

Chicago, May 27.—Persistent selling of May wheat by commission houses forced values in that market down until at 12.30 offerings were made at $1.44¼, a decline of 5¾ from the opening. At one time during the morning May wheat was 13 cents under the high mark of yesterday.

been one of the closest advisers of Premier Asquith. His appointment as Mr. Churchill's successor will probably not be followed by any important changes at the Admiralty.

"The other changes are chiefly serviceable as giving the country confidence that everything possible is being done to conclude the war successfully. From the standpoint of party politics the reconstruction of the Cabinet is of prime importance to the Liberals. It will not be impossible to create an impression among the voters that any one party is responsible if the war ends without all of Great Britain's intentions being realized.

GERMANY CALLS RESERVES

All Of Untrained Landsturm Over 35 Summoned To Colors.

Amsterdam, May 27.—Germany has called all her untrained landsturm over 35 years into active service, according to Berlin advices today. Italy's entrance into the war is said to have necessitated this step.

dent's order there is to be no discussion of intended action until all facts are known.

Commander Symington Goes To Liverpool For Inquiry

London, May 27.—American Ambassador Walter H. Page today sent Commander Powers Symington, naval attache of the United States Embassy, to Liverpool to make a thorough examination of the American steamship Nebraskan to determine whether or not she had been torpedoed by a submarine. Commander Symington was also instructed to receive the report of Capt. J. S. Greene of the steamer Nebraskan, which will be transmitted to the State Department at Washington by Ambassador Page.

The Nebraskan carried her name and home port, New York, in enormous white letters painted on both sides of her hull so that she would not be mistaken for a British merchantship by the commanders of German submarines, which are constantly prowling through British waters on all sides of the British Isles.

MAY GIVE NEW LUSITANIA DATA

Commander Symington Here On Way To Report At Capital.

Commander Powers Symington, U. S. N., naval attache at London and brother of W. Stuart Symington, Jr., was in Baltimore yesterday on his way to Washington with important information that is supposed to have a bearing on the sinking of the Lusitania by a German submarine several months ago.

Commander Symington's home is in Baltimore and he spent some time with relatives here. He went to Washington last evening. His information is said to be of a confidential nature, and he therefore declined to discuss his mission. The Commander interviewed survivors of the Lusitania disaster and got first-hand information for his Government. This, it is said, he is to submit to officials at Washington today.

Commander Symington has been on duty in London since the outbreak of the European war. It is believed he has much information bearing on the war that is to be made the subject of a verbal and personal report.

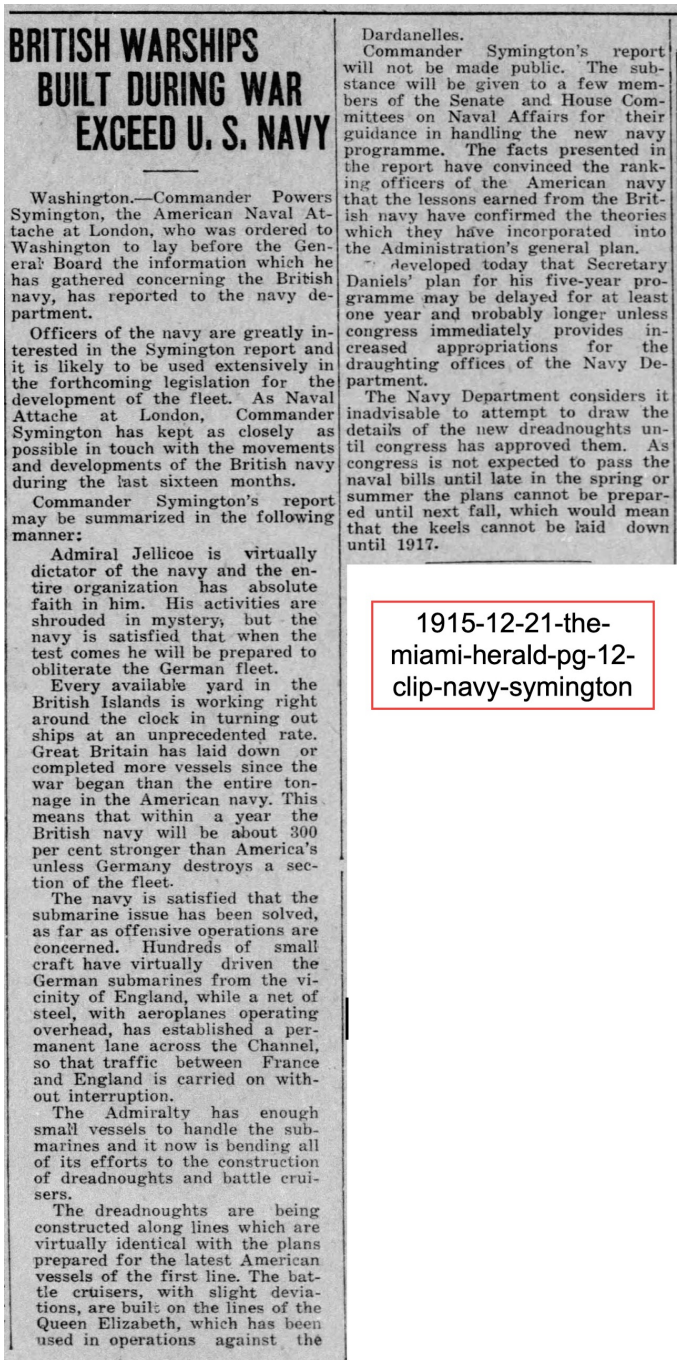
1915 (Dec 21)

[HN0069][GDrive]



BRITISH WARSHIPS BUILT DURING WAR EXCEED U. S. NAVY

Washington.—Commander Powers Symington, the American Naval Attache at London, who was ordered to Washington to lay before the General Board the information which he has gathered concerning the British navy, has reported to the navy department.

Officers of the navy are greatly interested in the Symington report and it is likely to be used extensively in the forthcoming legislation for the development of the fleet. As Naval Attache at London, Commander Symington has kept as closely as possible in touch with the movements and developments of the British navy during the last sixteen months.

Commander Symington's report may be summarized in the following manner:

Admiral Jellicoe is virtually dictator of the navy and the entire organization has absolute faith in him. His activities are shrouded in mystery, but the navy is satisfied that when the test comes he will be prepared to obliterate the German fleet.

Every available yard in the British Islands is working right around the clock in turning out ships at an unprecedented rate. Great Britain has laid down or completed more vessels since the war began than the entire tonnage in the American navy. This means that within a year the British navy will be about 300 per cent stronger than America's unless Germany destroys a section of the fleet.

The navy is satisfied that the submarine issue has been solved, as far as offensive operations are concerned. Hundreds of small craft have virtually driven the German submarines from the vicinity of England, while a net of steel, with aeroplanes operating overhead, has established a permanent lane across the Channel, so that traffic between France and England is carried on without interruption.

The Admiralty has enough small vessels to handle the submarines and it now is bending all of its efforts to the construction of dreadnoughts and battle cruisers.

The dreadnoughts are being constructed along lines which are virtually identical with the plans prepared for the latest American vessels of the first line. The battle cruisers, with slight deviations, are built on the lines of the Queen Elizabeth, which has been used in operations against the Dardanelles.

Commander Symington's report will not be made public. The substance will be given to a few members of the Senate and House Committees on Naval Affairs for their guidance in handling the new navy programme. The facts presented in the report have convinced the ranking officers of the American navy that the lessons earned from the British navy have confirmed the theories which they have incorporated into the Administration's general plan.

It developed today that Secretary Daniels' plan for his five-year programme may be delayed for at least one year and probably longer unless congress immediately provides increased appropriations for the draughting offices of the Navy Department.

The Navy Department considers it inadvisable to attempt to draw the details of the new dreadnoughts until congress has approved them. As congress is not expected to pass the naval bills until late in the spring or summer the plans cannot be prepared until next fall, which would mean that the keels cannot be laid down until 1917.

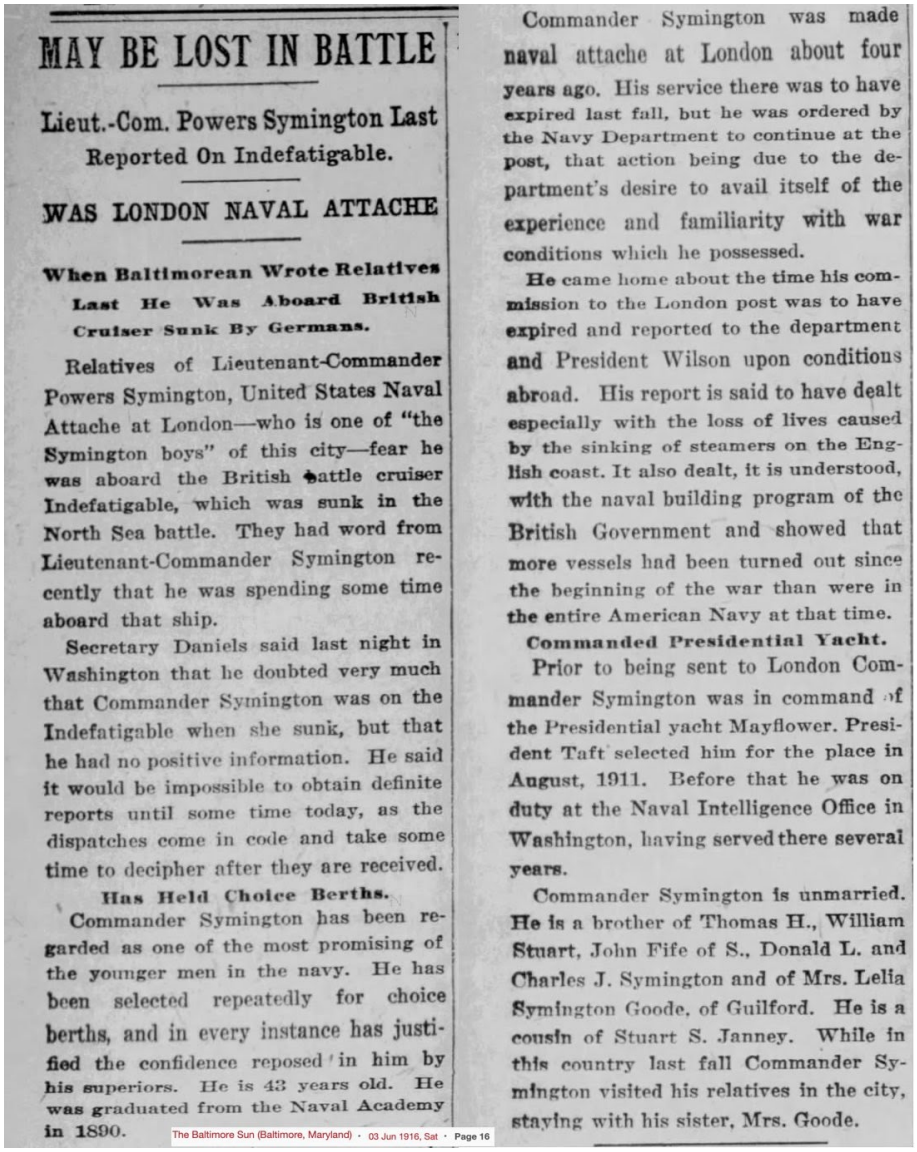
[HN006A][GDrive]

1916 (June) - Powers Symington - Fear that he was lost in battle

Full page : [HN004V][GDrive]



MAY BE LOST IN BATTLE

Lieut.-Com. Powers Symington Last Reported On Indefatigable.

WAS LONDON NAVAL ATTACHE

When Baltimorean Wrote Relatives Last He Was Aboard British Cruiser Sunk By Germans.

Relatives of Lieutenant-Commander Powers Symington, United States Naval Attache at London—who is one of "the Symington boys" of this city—fear he was aboard the British battle cruiser Indefatigable, which was sunk in the North Sea battle. They had word from Lieutenant-Commander Symington recently that he was spending some time aboard that ship.

Secretary Daniels said last night in Washington that he doubted very much that Commander Symington was on the Indefatigable when she sunk, but that he had no positive information. He said it would be impossible to obtain definite reports until some time today, as the dispatches come in code and take some time to decipher after they are received.

Has Held Choice Berths.

Commander Symington has been regarded as one of the most promising of the younger men in the navy. He has been selected repeatedly for choice berths, and in every instance has justified the confidence reposed in him by his superiors. He is 43 years old. He was graduated from the Naval Academy in 1890.

Commander Symington was made naval attache at London about four years ago. His service there was to have expired last fall, but he was ordered by the Navy Department to continue at the post, that action being due to the department's desire to avail itself of the experience and familiarity with war conditions which he possessed.

He came home about the time his commission to the London post was to have expired and reported to the department and President Wilson upon conditions abroad. His report is said to have dealt especially with the loss of lives caused by the sinking of steamers on the English coast. It also dealt, it is understood, with the naval building program of the British Government and showed that more vessels had been turned out since the beginning of the war than were in the entire American Navy at that time.

Commanded Presidential Yacht.

Prior to being sent to London Commander Symington was in command of the Presidential yacht Mayflower. President Taft selected him for the place in August, 1911. Before that he was on duty at the Naval Intelligence Office in Washington, having served there several years.

Commander Symington is unmarried. He is a brother of Thomas H., William Stuart, John Fife of S., Donald L. and Charles J. Symington and of Mrs. Lelia Symington Goode, of Guilford. He is a cousin of Stuart S. Janney. While in this country last fall Commander Symington visited his relatives in the city, staying with his sister, Mrs. Goode.

New Allowance for Naval Officers.

A decision of importance to naval officers is that reached by Acting Secretary Roosevelt this week by his approval of the recommendation of bureau chiefs and the commander-in-chief of the Atlantic fleet that blankets, sheets, pillow cases, and bed spreads be provided for the use of commissioned and warrant officers on board ship, to be carried on the allowance lists as equipage, title B, and charged to the appropriation "Construction and Repair;" that napkins and towels for commissioned and warrant officers on board ship be added to the allowance lists as equipage under title B and charged to the appropriation "Maintenance, Supplies and Accounts," and that hammock mattresses be supplied to the crews of vessels and to enlisted men of the Navy on shore, these mattresses to be accounted for in like manner as are hammocks. Upon transferring men, hammocks and mattresses will be retained on board ship or at the station, thus reducing the amount of baggage to be handled. The allowance lists now provide napkins as a part of the mess outfit for all officers' messes on board ship. The allowance of other articles will be ten hand towels, ten bath towels, four sheets, two pillow cases, one double blanket, and two spreads. The enlisted men now in the service own their own hammock mattresses. It is not the intention to replace these mattresses, but it is proposed to provide a hammock mattress for all men enlisted after a certain date. This suggestion regarding allowances to officers came from Commander Powers Symington, U. S. Navy, on duty as naval attache at London, who wrote to the Navy Department pointing out the desirability of furnishing all officers with blankets and linen, saying: "I have found it very convenient in going from ship to ship in the British navy not to have to carry an extra trunk full of blankets, sheets, pillow cases, napkins, bedspreads, and towels, as these articles are supplied to the ship by the Admiralty. I am convinced that this would be a great convenience to officers when transferred and would save probably one trunk for every officer in the Navy." The proposition was heartily approved by the bureau chiefs and by Admiral Mayo. The surgeon general remarked that while it would seem at first that the use of a mattress by different individuals would be unhygienic, it was a practice at all hospitals, hotels, etc., to use the same mattress for different individuals without even a mattress cover. He added: "It is believed that the use of the mattress cover will largely eliminate the chances of soiling the mattress itself. Furthermore, on the more modern ships disinfectors are being installed as well as on board the hospital ship. There are also disinfecting plants at all the large naval hospitals, at the training stations, and at some of the navy yards, but the disinfection of a mattress is not considered necessary unless it has been exposed to contagion or infection."

NAVY RUSH ORDER FOR CHASER GUNS

Contracts Let for 2,400 3-Inch and Several Thousand One Pounders.

WASHINGTON, MARCH 1.

The first step toward speedy procurement of additional much needed guns for use against submarines was taken by the Navy Department late yesterday, when bids were opened for 2,400 3 inch weapons and several thousand 1 pounders. The manufacturers have agreed to complete the contract within six months.

The 3 inch weapons, which are modelled after the types which British patrol boats have used effectively against German U-boats, will be mounted on merchantmen, patrol boats and particularly on a selected type of motor boat designed as a submarine chaser. The 1 pounder weapons will be mounted on small patrol boats.

There is much interest in the new type of patrol or motor boat which the government had adopted to cope with possible visits of German U-boats in the Atlantic waters. The Electric Boat Co. of New York built 500 of these boats for Great Britain and many of them are doing excellent service in the English Channel.

There is much interest in the new type of patrol or motor boat which the government had adopted to cope with possible visits of German U-boats in the Atlantic waters. The Electric Boat Co. of New York built 500 of these boats for Great Britain and many of them are doing excellent service in the English Channel.

It is expected, however, that the British government now favors a heavier type of boat, as practice has shown that these craft must be ocean going and at the same time equipped with heavy enough armament to cope with the guns of the U-boat.

During the first months of the war the German submarines relied particularly on torpedoes, it is said, but recent reports from American naval attaches abroad show that practically all German U-boats are now armed with guns of about 3-inch calibre.

The theory on which the British admiralty is proceeding with respect to its motor boat submarine chasers is that numbers is the all important factor. It is held that a German U-boat would hardly venture attack in the presence of six or eight or ten of these craft. It is understood the United States will follow the same idea.

The naval intelligence office here has received detailed information concerning Great Britain's defensive measures against submarines, much of which was gathered by Commander Powers Symington, who was American naval attache at the American Embassy in London. It is understood the Navy Department will let a contract to the Electric Boat Co. for motor boats as soon as the $150,000,000 emergency appropriation which Secretary Daniels has asked becomes available.

Sidetracked.

WARFARE OBSERVERS SENT TO OBSCURITY.

OFFICERS HOME FROM ABROAD GET REMOTE BILLETS.

Department Assigns Army Men Back from Foreign Front to Posts Far from Present Activity. Unusual Course Arouses Criticism as Causing Loss of Efficiency.

[BY DIRECT WIRE—EXCLUSIVE DISPATCH.]

WASHINGTON, March 28. — Lieut.-Col. Spencer Cosby, Engineer Corps, U.S.A., recently returned from France, where he absorbed valuable information relating to modern warfare, has been sent by the War Department to Milwaukee to superintend the building of a bridge.

Capt. Powers Symington, U.S.N., recently returned from London, where he had opportunity to familiarize himself with the most powerful navy in the world, has been sent to command the cruiser Tacoma, a ship unfit for real warfare.

The assignment of these military men to obscure duty on the eve of the war, thus placing them where their experiences in the European conflict can be of no value to the army and navy of the United States, has given rise to criticism.

When attention had been called to these instances of shunting away from headquarters men whose information at such a time could be used to advantage by the War and Navy departments, investigation revealed that they are not the only American military observers in Europe who came home only to be ordered far away from headquarters. Here are a few other instances: Lieut. John G. Quekemeyer, observer at French and English fronts, now with Seventh Cavalry at Fort Bliss, Tex.

Maj. Samuel D. Rockenbach, observer of the efficiency of the German fighting machine, now discussing it with his comrades on the Mexican border in the vicinity of Laredo.

Lieut.-Col. George T. Langhorne, after service as military attache at Berlin, recalled and sent to Fort Bliss to think it over.

Maj. J. K. Miller, who studied modern warfare on French and English fronts, now applying his knowledge of trench fighting to the Canal Zone guards.

Department officials insist that these men will be assigned to duty when the proper time arrives, but so far, having encountered opposition in the department in the present administration, their names have been overlooked, despite the woeful shortage of officers.

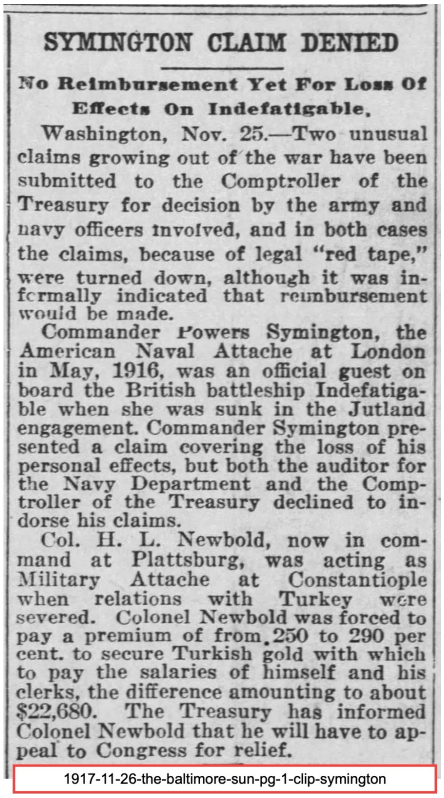
[HN006F][GDrive]



SYMINGTON CLAIM DENIED

No Reimbursement Yet For Loss Of Effects On Indefatigable.

Washington, Nov. 25.—Two unusual claims growing out of the war have been submitted to the Comptroller of the Treasury for decision by the army and navy officers involved, and in both cases the claims, because of legal "red tape," were turned down, although it was informally indicated that reimbursement would be made.

Commander Powers Symington, the American Naval Attache at London in May, 1916, was an official guest on board the British battleship Indefatigable when she was sunk in the Jutland engagement. Commander Symington presented a claim covering the loss of his personal effects, but both the auditor for the Navy Department and the Comptroller of the Treasury declined to indorse his claims.

Col. H. L. Newbold, now in command at Plattsburg, was acting as Military Attache at Constantiople when relations with Turkey were severed. Colonel Newbold was forced to pay a premium of from 250 to 290 per cent. to secure Turkish gold with which to pay the salaries of himself and his clerks, the difference amounting to about $22,680. The Treasury has informed Colonel Newbold that he will have to appeal to Congress for relief.

San Pedro Daily News, Volume XIX, Number 260, 12 November 1920

Local Navy Officers Receive Awards

Many war medals are being received in San Pedro, among those which were awarded here yesterday was Naval Air Cross for Captain Chauncey Shackford, Commander of the Submarine Base and Lt. Com. E. L. Barr also of the base.

Among the officers of the fleet to receive medals are Captain Dewitt Blamer, Commander D. L. Ghent, Lieutenant Commander D. V. McCandish, Lieutenant Commander Louis Hancack Jr., Lieutenant, (junior grade) W. J. Clark and Captain A. N. Parks.

Five naval officers now on duty at San Diego will be presented with medals. The officers, their station and the medals which they will be presented are as follows: Rear-Admiral Roger Welles, commandant of the San Diego naval base, Navy cross; Captain J. H. Tomb, commandant of the North island naval air station, Distinguished Service cross; Captain Powers Symington, chief of staff to Admiral Welles, Navy cross; Commander H. C. Curl, medical corps, commandant of the naval hospital here, Navy cross; Captain W. W. Gilmer, port director of naval transportation, Navy cross. All these officers were on duty with the American battle fleet in the North sea during the war with the exception of Admiral Welles, who was director of naval intelligence at Washington.

CWA POST QUIT BY SYMINGTON

Captain Powers Symington, county director of the Civil Works Administration, resigned that position yesterday as the State Emergency Relief Administration made ready to take over the Federal employment program. The resignation, effective tomorrow, was accepted by Captain Edward Macauley, State CWA director.

Symington's resignation was not unexpected, in view of the refusal of Captain Macauley to accept appointment as head of the Works Division of the SERA. Symington, close friend of Macauley, accepted the post with the Federal agency only at Macauley's insistent urging.

As Symington withdrew from the CWA directorship, complete demobilization of CWA workers, except those in clerical departments, was accomplished in the State. More than 75,000 workers were dropped from the rolls, including 8,000 in San Francisco.

R. C. Branion, head of the SERA, announced that H. V. Grant, assistant to Symington, will take over his former chief's duties under the new plan. In Alameda County, Chester R. Hunt will be replaced by F. M. Holly. Under the SERA, the county directors will be known as construction managers, and their duties will be considerably curtailed, Branion said.

Branion estimated that in less than two weeks, the SERA program will be under way and the first contingent of workers will be back on their jobs.

A number of California surveys, undertaken by the CWA, will be carried on by the SERA without interruption, he said.

8,000 CWA Workers Lose Jobs; SERA to Start

The last Civil Works Administration job in California came to a close last night. And some 8,000 workers were warned by R. C. Branion, director of the works department of the State Emergency Relief Administration, that it will be useless for them to attempt to return to work on CWA jobs Monday. Future plans for SERA jobs will be announced before Monday by Branion through the newspapers, he said.

MARIN FLYERS GO TO CAPITAL

SAN RAFAEL, May 17.—Hamilton Field will be depopulated of flyers and mechanics for the next ten days while the 7th headquarters detachment and the 70th service squadron camp at Mather Field, Sacramento, for a period of actual field training. First detachment of eight men under St. Sgt. Hershell Adams left yesterday and today 82 enlisted men commanded by St. Sgt. Francis Monahan left for the capital to set up camp. Thirty bombing planes, one transport ship and some 66 trucks and motorcycles will leave Saturday morning for Sacramento. Col. Clarence L. Tinker will command the training maneuvers.

Funeral services were held today for Joseph W. Glaser Sr., who died at his home in San Anselmo Wednesday night. Glaser, well known San Francisco hardware merchant of years ago and of recent years manager of the San Anselmo offices of the Lang Realty Co., was one of the organizers and the first president of the North Beach Merchants Association. He retired several years ago.

Annual dinner of the San Rafael Chamber of Commerce will be held at the Marin Golf and Country club Tuesday at 7 p. m. An interesting and entertaining program has been arranged. George V. Kaenel, the retiring president, will give a brief review of the achievements of the past year.

Urgent appeal to residents of Marin county to attend the Mountain Play in the natural amphitheater on the south slopes of Mt. Tamalpais Sunday was issued today by Marvelous Marin Inc., which has undertaken sponsorship of the play as one of its major annual activities.

Bay section members of the California Elementary Principals' Association will meet Saturday evening at Hotel Oakland to hear an address by Vierling Kersey, state superintendent of public instruction, on the place of the elementary principals in the state school system.

Lt. Col. Glen I. Jones, M. D., and family arrived today on a transport from Washington, D. C. Col. Jones is reporting for duty at Hamilton Field and will command the station hospital.

A very simple but lovely home wedding will take place Saturday night, May 25, when Miss Betty McLaren becomes the bride of Harold Scott at the McLaren home in Kensington Road, San Anselmo at 8 o'clock.

Sailing with Colonel Henry L. Roosevelt, assistant secretary of the Navy, to Honolulu will be Captain Powers Symington of Kentfield, former naval officer and friend for many years of Colonel Roosevelt.

First ladies' night of the Twenty-Thirty club was held last evening at the Marin Golf and Country club when members of the club entertained their ladies at a dinner meeting.

MRS. LELIA GOODE, 69, DIES IN HOPKINS

Daughter Of Major And Mrs. W. S. Symington Succumbs To Pneumonia

Organized First Church In Idaho Town When State Was Frontier

Mrs. Lelia Symington Goode, daughter of the late Major and Mrs. W. Stuart Symington and a sister of the late Judge W. Stuart Symington, died at 9 o'clock last night in the Johns Hopkins Hospital. She was 69 years old.

Mrs. Goode's death was unexpected, since she apparently had been on the road to recovery from bronchial pneumonia, which she contracted about two weeks ago.

A native Baltimorean, Mrs. Goode went to Couer d'Alene, Idaho, to live shortly after her marriage to the late John Goode, a Virginian. Mr. Goode was a district attorney in Idaho when that State was regarded as being on the frontier.

Organized First Church

Mrs. Goode organized the first church in the little Idaho town and played a prominent part in the social and church activities while there.

Survivors of Mrs. Goode, who in recent years lived at the Severn Apartments, include a son, Stuart S. Goode, of Los Angeles, Cal.; two daughters, Mrs. R. E. Lee Taylor, of this city, and Mrs. Robert McLean, of Philadelphia.

Four Brothers Survive

She is survived also by four brothers, Capt. Powers Symington, U. S. N. (retired); C. J. Symington, of New York; Donald Symington and Jack Symington, both of Baltimore.

Funeral services will be held at 4 P. M. tomorrow in Emanuel Protestant Episcopal Church. Burial will be in the family plot in Greenmount Cemetery.

CAPTAIN POWERS SYMINGTON
834 GROVE STREET
SAN FRANCISCO, CALIFORNIA

June 30 1944

Dear Mr President It occurs to me that you might be at a loss to find a suitable present to give Mr Churchill, a gesture of friendship between the two great men of our time. I am enclosing something that I think will interest you and be acceptable to him.

In 1916 I was as you may remember with the Grand Fleet and a short time before the battle of Jutland I got the Division Commanders of the Fleet to sign these papers as I could have a souvenir of my pleasant association with that great group of British Seamen. A number of them were killed at Jutland and these documents do become unique. I had thought at one time to give them to the Naval Academy Museum but believe now they should right be in Britain, perhaps in the Admiralty.

Mr Churchill was 1st Lord when I went to England and I believe he would appreciate the special significance of these papers to the British Navy. I don't care if you stay in for six terms. More power to you.

Yours in high great respect.
P. Symington

M02

PSF Churchill

July 7, 1944.

My dear Powers:-

It is certainly good to hear from you again -- and especially such a nice letter with its enclosures.

I think it is a grand idea that these very interesting documents should be in Britain. I shall send them, at the first opportunity, to the Prime Minister as a gift from you via me to the British Prime Minister and the British Navy.

I do hope to see you one of these days soon.

With all good wishes,

Very sincerely yours,

FRANKLIN D. ROOSEVELT

Marshall Dill Jr. Will Wed British Author

Novelist and Navy Officer to Exchange Vows in London Nuptial

By CHOLLY FRANCISCO

A HERALDING of international interest makes the latest romance headlines with the announcement that localite Lt. Marshall Dill Jr., is engaged to Pamela Frankau, British novelist. Futhermore, an October 30 wedding is tentatively planned to take place in London, where the naval officer has been stationed for some time.

The bride-elect is the daughter of novelist Gilbert Frankau and the late Mrs. Frankau and is the author of about twenty published works, among them "Fly Now, Falcon," "Laughter in the Sun," "Appointment With Death" and "I Found Four People." A member of the British Army, the future Mrs. Dill holds the rank of senior commander (major) in the Auxiliary Territorial Service (ATS). In 1940 she was in Hollywood, where she worked for Sir Alexander Korda.

After her return to England, the future bride spent several months doing shortwave broadcasts to this country for the British Broadcasting Corporation.

A MEMBER of a well known local clan is the prospective bridegroom, who is the son of Marshall Dill, prominent civic leader, and the late Edna Fay Dill. He is a grandson of Mrs. Laura Marshall Dill and the late George H. Dill, and of the late Mr. and Mrs. Philip S. Fay. Marshall is also a nephew of Mrs. Aileen Thomson, Mrs. Powers Symington, Paul B. Fay and Clarence A. Fay, and of the late Mrs. Kirby Crittenden, Mary F. Fay, Charles W. Fay, Philip J. Fay and Stanley J. Fay.

An alumnus of Stanford, where he received his degree in 1937 and a master's degree in 1940, the future benedict also attended the Graduate School of Arts and Sciences at Harvard. He is a member of Theta Delta Chi and Phi Beta Kappa. For the past three years the naval officer has been on active duty and is now attached in London to the Commander, United States Naval Forces in Europe.

SETTING FOR the nuptials will be St. James's Church, Spanish Place, the Rev. Richard Mangan, S. J., officiating. Afterward a small reception will be given by the bride-elect's father at the home of Mr. and Mrs. Robert Bruce. Mrs. Bruce is a sister of Capt. the Hon. Robin Maugham, son of Somerset Maugham.

Golden Wedding Guests Were Among Those At S. F. Wedding In 1895

A dinner party was held recently at the Lagunitas Club honoring Mr. and Mrs. E. G. Schmiedell of Ross on their golden wedding anniversary. Sixty-five guests were seated at a golden horseshoe table where golden leaves and fruits along the table, and flowers in tall golden containers, made the decorations long to be remembered. Golden tapers were inthe candlesticks.

Seward McNear was master of ceremonies. Members of the wedding party 50 years ago were present as well as the Schmiedell family.

The honored guests have two daughters, Mrs. James Moffitt and Miss Doris Schmiedell, one son, Edward G. Schmiedell Jr. They have one granddaughter, Mrs. Richard P. Gatterdam (Alice Moffitt) and a great-grandchild, James Moffitt Gatterdam.

Teh wedding of the Schmiedells took place in Grace Church in San Francisco in 1895.

Guests included Mrs. Henry S. Kiersted, Mrs. Grace Martin Horn, Miss Mary Eyre and Miss Sarah Collier, who had been the bride's attendants, and William Page, who was an usher. These were in the group of hosts at the anniversary fete.

Others were General and Mrs. George Pillsbury, Captain and Mrs. Powers Symington, Dr. and Mrs. Herbert Moffitt, Messrs. and Mesdames Benjamin Dibblee, Seward McNear, Willard O. Wayman, John Forbes, Wakefield Baker, A. Crawford Greene, Mesdames Frederic Hope Beaver and Harry Poett.

Chamber of Commerce Anniversary

ANOTHER OF this week's gala gatherings took place last evening when San Francisco's Chamber of Commerce received honors on its centennial anniversary. For the occasion, about 1,000 people met in the Palace Hotel's Garden Court for a formal dinner. Tables, set for ten, were centered with outstanding arrangements of seasonal flowers.

Paul A. Bissinger, president of the chamber, presided at the speakers' table. Guest speaker was the Hon. W. Stuart Symington, secretary of the Air Force, who planed west for the occasion, which commemorated, in addition to the hundreth anniversary of the founding of the chamber of commerce, the centennials of California's admission to the Union and of the City of San Francisco's receipt of its charter.

Among those gathered at a table were the Marshall Dills, the Paul B. Fays, Capt. and Mrs. Powers Symington, the William Wallace Meins and Sally Fay. Others noted included Mayor and Mrs. Elmer E. Robinson, the Joseph S. Thompsons, the A. J. Gocks, Brig. Gen. G. H. Davidson, V. Adm. and Mrs. G. D. Murray, and R. Adm. and Mrs. J. E. Stika.

At the conclusion of the affair, the Robert Chatfield-Taylors entertained a group at supper at their Pacific Avenue home.

Susan Smith Says:

Mein's Togs Fit For King

THE DYNAMIC Mrs. Powers Symington (Maude Fay), who was well-known in Germany as one of the great Wagnerian singers, and who was always spoken of as the "Great Fay," lived a brilliant and glamorous life in the years before World War I. She was considered a great artist not only in Germany but was also welcomed in England where she sang at Covent Garden in the gala performance for the Crown Prince of Sweden. She was greatly loved and respected by those of the most exalted position as well as by the humblest.

In all the years since, her loyalty and devotion to those friends in Germany, especially in Bavaria, and in Austria, has never wavered, and she has devoted herself to alleviating their distress, fairly taking the clothes off her husband, "Pete," to send them to those who are in such dire need. Occasionally she levies on her friends as well, wherever she may chance to see them.

An example of her powers of persuasion is the following story told by her of a visit to the William Meins at Woodside:

"At a dinner at the William Meins last summer I went into the guest room to titivate and saw there a couple of huge boxes. Being the most unsuccessful package maker in the world, I was lost in admiration of the virtuoso detail work of the wrapping. I asked Frances Mein to what country they were destined. She has been so very generous, especially to England. She knew I was stripping my close friends and relatives almost to the bone sending clothes to Bavaria and Austria.

"These two countries were home to me for sixteen years and the present distress of those wonderful friends is never out of my heart or mind. Persons who have had fabulous wealth, palaces and castles, and whose family names have been identified with diplomats, statesmen, and social and cultural lead-

(Continued on Page 5, Col. 3)

Susan Tells of 'Clothes for King'

(Continued from Page One)

ers of central Europe for centuries, are now penniless without homes and absolutely dependent upon friends and relatives in foreign countries; all were anti-Hitler and many were in prison for years. Among them is Count Walter von Berchem, a close and dear friend of my Munich period.

"When Frances offered to send some things to my friends I was elated. She said, 'You can have those boxes, but I am not certain what's in them' — she thought, however, that it was all men's clothing. In one special box she had put an elegant suit of Bill's and with her charming manner of giving she had put extravagant neckties in each pocket of the suit.

"I did not see the clothes, as for nothing in the world would I have disturbed those perfect wrappings, even at the risk that an old bachelor might be showered with infant layettes.

Thanks for Gifts

"Count Berchem received the elegant suit with the gorgeous ties. His letter to me, effulgent with words of thanks, related the following experience: His cousins, the Schonborns, opened their historical castle, 'Schloss Wiesentheid' in Unterfranken-Germany, for a week of festivities, inviting forty-eight guests; artists, professors, scientists, relatives, and among them was the 80 year old Crown Prince Ruprecht with his charming daughter.

"His first wife, who died suddenly in Sorrento, was the wondrously beautiful Princess Marie Gabriele, a niece of the Empress Elizabeth of Austria. All those gathered together in the castle look upon Prince Ruprecht as the legitimate king of Bavaria, although the prince himself has no delusions about ever ascending the throne. Count Berchem writes, 'His Majesty is still mentally and physically vital, extremely well informed, and very intelligent;' he continues his letter, 'thanks to your fabulous gift.

"I aroused extravagant attention and admiration clothed in the most stunning suit of clothes and tie that I have ever seen since many years ago, when I used to give so much thought, time and money to my own wardrobe. I felt like a Hochstapler (a professional top-drawer thief).

"A very young princess was brought into the drawing room to meet His Majesty; on seeing the two men standing together when she was presented, she just naturally made a deep reverence to the elegant 'Mein clothes', to the real amusement of the king, shabby in comparison to Count Berchem, and to the embarassment of the count, who has been living in the Tyrol in poverty, all his great estates and wealth confiscated. He explained that some old castles, not too demolished in the war have again been taken over by their owners.

Peasants Raise Food

"The peasants in the countryside raise all the food and cultivate the wine and are given very small wages as they live on the estates and are provided with homes; they belong to families that have served in the castles for centuries.

"It is an attractive thing to have the very young people visit in an ancestral home where they witness the kind of life, of culture, of good manners, good taste, generous sharing and kindliness which was that of their forebears.

"Bill Mein will have to remember when ordering his clothes, they must be fit for kings of yesteryear."

Frances Fay, John Bowes to Wed

By FRANCES MOFFAT
Society Editor, The Examiner

THE WEEK opens with an important romantic announcement, coming from Mr. and Mrs. Charles W. Fay Jr., who are telling of the engagement of their oldest daughter, Frances, to John Garland Bowes, son of Mr. and Mrs. William Ketcham Bowes.

FRANCES FAY AND JOHN GARLAND BOWES
Their engagement is announced by her parents

Their marriage is planned for after the first of the year. Frances is the sister of Dorothy Fay, a 1954 debutante, and little Victoria. She is the granddaughter of Mr. and Mrs. William Wallace Mein and the late Mr. and Mrs. Charles W. Fay.

THE BRIDE-ELECT, one of the most popular subdebs, is a grand-niece of Mrs. Powers Symington and Paul B. Fay. She is the niece of Mrs. Charles de Bretteville, William Wallace Mein Jr. and Gardner Mein.

She attended Miss Burke's and was graduated from Garrison Forest School in Maryland. She attended the University of California, where she belonged to Alpha Phi. Frances made her bow at the 1952 Cotillion Ball and will give up membership in The Spinsters with her marriage.

John is the son of Mr. and Mrs. William Ketcham Bowes of this city. He has a brother, William K. Bowes Jr., and is the grandson of Mrs. Edwin Jonathan Bowes and the late Mr. Bowes of San Francisco and of the late Mr. and Mrs. Arthur Addison Garland of Santa Barbara.

THE YOUNG MAN is the nephew of Edwin Laurence Bowes and Mrs. Egbert Bailey Clark, both of this city; Mrs. Frederick Diehl of Evanston, Ill., Mrs. Merton L. Jenk of Beverly Hills, Eldon Addison Garland of Colusa and the late Arthur Henry Garland.

John was graduated from Stanford, where his fraternity was Phi Gamma Delta and also has a degree from the Harvard Graduate School of Business. He served during the Korean conflict as an Air Force lieutenant. He is a member of The Bachelors.

Capt. Powers Symington Dies In S.F.

Requiem High Mass for retired Navy Capt. Powers Symington, former summer resident of Marin County and an uncle of Sen. Stuart Symington (D-Mo.), was celebrated today at St. Brigid's Church, San Francisco. Burial was in Holy Cross Cemetery, Colma.

An octogenarian, Captain Symington died Friday in San Francisco. He had been in poor health for some time.

1957-11-18-daily-independent-journal-san-rafael-c-pg-4-clip-symington

Captain Symington and his wife, former operatic star Maude Fay, spent many summers in Kentfield. They sold their home there several years ago. Mrs. Symington, who survives, was founder and organizer of the Marin Music Chest. She is a member of a pioneer San Francisco family.

Until recently, the couple lived in the old Fay family mansion on Grove street in San Francisco.

Captain Symington retired from active Navy duty in 1925. He was an observer aboard a British warship during the Battle of Jutland in 1916, before the U.S. entered World War I. During World War II the Navy recalled him for duty in the United States.

Besides his wife, he is survived by many nieces and nephews.

SYMINGTON DIES AT 85

Retired Navy Captain Had Made Home In California

Capt. Powers Symington, retired naval officer and member of a distinguished Maryland family, died yesterday in St. Francis Hospital in San Francisco after about a week's illness. He was 85 years old and had made his home in California for many years.

Son of the late W. Stuart Symington and Lelia Powers Symington, Mr. Symington grew up here and graduated from the Naval Academy in 1890.

Had Long Career

Captain Symington saw service around the globe during his long career. He was Naval attaché to the United States Embassy in London in the years before the United States entered World War I.

Among his commands were the cruiser Tacoma and the Presidential yacht Mayflower.

In 1922, Captain Symington married Miss Maud Fay, an opera singer, who survives him. A brother, Charles J. Symington, lives in New York.

Page 56—S.F. Examiner Thursday, Oct. 8, 1964 5C2H*

Mrs. Powers Symington Dies

Maude Fay (Mrs. Powers) Symington, a native San Franciscan who became one of Germany's great pre-World War I Wagnerian sopranos, died here yesterday. She was 84.

Mrs. Symington was born April 18, 1878, at 834 Grove St., the family home built by her father, Philip Fay. Her residence was at 1999 Broadway.

She was educated in The City's public schools, and in 1902 went to Dresden, Germany, where she studied for the opera under Madam Orgeni.

DEBUT IN 1906

She made her debut in 1906 with the Munich Royal Opera as Marguerite in Faust. Earning the critcis' title "Die Fay," she sang before the then crowned heads of Europe including King Alfonso of Spain and the King of Sweden.

Prince Heinrich Luitpold of Bavaria wooed the Irish girl, but his untimely death prevented their marriage.

Mrs. Symington returned to the U. S. in 1916, making her first appearance with the New York Metropolitan Opera as Elsa in Lohengrin.

MUSIC PATRON

In 1922 she married Capt. Powers Symington of Baltimore, a naval officer. They lived in New York and Paris, and in 1927 returned here.

Once settled here and in Kentfield, Marin County, Mrs. Symington quickly became one of The City's leading patronesses of music and the arts. She founded the Marin Music Chest, and in 1932 was named impresario of San Francisco Opera Comique, Inc.

BLUNT ADVICE

Her husband moved in political circles, was a "New Dealer" of note, and served for awhile as the county Civil Works Administration chief. Mr. Symington died in 1957.

An outspoken member of the social scene, she once approached a younger, somewhat plump soprano and said, "You have the most beautiful voice since Rethberg, but you simply must lose 20 pounds."

On another occasion she advised a socialite planning to "abandon society" because it prevented one from truthfulness, "Tell the truth, and society will abandon you."

She loved to entertain—and even flames leaping from an adjoining home failed to keep her from luncheon preparations for a distinguished visitor. She then found food and shelter for the fire victims.

KIN A CABINET AIDE

Mrs. Symington is survived by her brother, Paul B. Fay Sr., and several nieces and nephews. Among the nephews are Paul B. Fay Jr., Undersecretary of the Navy. A nephew of her late husband is Democratic Senator Stuart Symington of Missouri, a former Secretary of the Air Force.

The Rosary will be recited tonight at 8:15 o'clock at the MacAvoy - O'Hara Mortuary. A Requiem Mass will be celebrated at 11 a.m. tomorrow in St. Brigid's Church, Van Ness Ave. and Broadway.

OBITUARY

Maude Fay Symington Dies At 86

Maude Fay Symington, founder of the Marin Music Chest and a former prima donna of grand opera, died yesterday in her San Francisco home at the age of 86.

She and her husband, Capt. Powers Symington of Baltimore, Md., a naval officer and diplomat, spent their summers at "High Hat," their home on the Fay Estate in Kentfield until three years before his death in 1957.

She attended public school in her native San Francisco and in 1902, went to Dresden, Germany, to study singing with Aglaia Orgeni, a famous voice teacher.

She made her debut as Marguerite in "Faust" at the Munich Royal Opera House in 1906 and came to be known at "Die Fay" in Germany, where she sang leading roles in operas of Wagner and Richard Strauss. Her career took her to Budapest, Paris, Vienna, Brussels and London, in all of which she was hailed as an outstanding operatic soprano.

Two years after World War I, she returned to the United States where she sang with the New York Metropolitan, Chicago and San Carlo Opera companies. After several successful concert tours, she retired.

She and Captain Symington, an uncle of Sen. Stuart Symington of Missouri, were married in 1922 and after living in the East and Paris, came to the coast in 1927. They maintained residences in both Kentfield and San Francisco.

In March, 1933, she explained her dream of a music chest for Marin to a mass meeting in the Marin Junior College gymnasium in Kentfield. Its organization followed immediately. The first series of concerts was presented in 1934. Mrs. Symington served as president of the Marin Music Chest for seven years.

In 1939, she received the Morago Crest at the 76th commencement exercises at St. Mary's College for her efforts in "furthering the European tradition of culture on the Pacific Coast."

Surviving are her brother, Paul B. Fay, and several nieces and nephews including Paul B. Fay Jr., undersecretary of the Navy, and Dr. Marshall Dill Jr., chairman of the history department at Dominican College in San Rafael.

Rosary will be recited at 8:15 p.m. today at McAvoy-O'Hara Co., 4545 Geary Boulevard, San Francisco. Requiem High Mass will be celebrated at 11 a.m. tomorrow at St. Brigid's Church, Van Ness Avenue and Broadway, San Francisco.

Contributions to the Little Children's Aid or the Marin Music Chest are preferred by the family.

1976 (Jan 10) - Remembering Mrs. Symington

Remembering The Diva

By Stuart Nixon

"Statuesque Maude Fay Symington, her opera career behind her, descended like Brunhilde on Marin County in 1929, determined to transform the quiet suburbs into an American Bayreuth."

Maude Symington succeeded beyond the imagining of those she prodded. Dairy farmers and country lawyers are seldom moved by song. Yet Marin ranchers, professional people, laborers and schoolchildren came to share Maude's dream. Forty-one years after her Marin Musical Chest lit its first candle in the rural darkness, its heritage makes this county a vanguard figure in America's swing toward culture.

Maude Fay was born in San Francisco in 1878, one of nine active and articulate brothers and sisters. Her summers were spent in the family cottages off Laurel Grove Avenue, in Kentfield. She learned early that she had a voice, and with hard-won funds, she left for Munich to have it trained. Maude's success was dazzling: she created operatic roles for Richard Strauss, sang with Caruso, became an Irish-American prima-donna.

World War I almost broke Maude Fay's heart. In post-War America she sang but little, after being branded pro-German at the "Met". But she preserved her love of music, married an American Navy officer, and when he retired, came back to Kentfield to live and work.

Captain and Mrs. Powers Symington built a small Mediterranean villa on the hilly back lot of the Fay property. Never affluent, they somehow entertained family, friends and celebrities at "High Hat", and their hospitality grew to a legend. Yet Maude needed more outlets for her tearing energies, disciplined and shown the soul's summits by opera. Her democratic ideals had been sharpened by the aristocratic traditions of Europe, and she determined to implant them in her home soil.

This would take the form of a people's music festival to be shared by everyone, rich and poor, young and old. As she said: "The greatest music in the world, for the greatest number of people, at the lowest possible prices." In Depression-era San Rafael, Mill Valley, Fairfax — concerned mainly with economic survival — this was quite an order.

Carlos Freitas, then a young attorney, recalls Maude's first appearance at his office in 1931. He was president of Marvelous Marin, a booster organization; and she wanted its support for her music festival. Says Judge Freitas:

"Mrs. Symington was lucid, enthusiastic and terribly persuasive. For her, parliamentary law was never invented. You simply couldn't say no. In five minutes I was overwhelmed."

Recognizing that a festival of this kind could never be supported by a few socialites and commuters, Maude went after the broadest political and financial base. Her nephew, Professor Marshall Dill of Dominican College, recalls the dark mornings when "she would wake Uncle Pete to drive her out to Point Reyes and catch the dairy farmers when they came in from milking."

In 1932-3, and for years thereafter, Mrs. Symington's concept of the Marin Musical Chest permitted anyone to join for as little as 25 cents, and to gain admittance to its concerts for another 25 cents. Non-members were supposed to pay $3. Firms and more affluent individuals were dragooned into paying more, of course. In the mid-1930's the Chest membership ran between 4000 and 5000, in a county with a population of under 50,000.

During the Chest's formative years, Maude's devoted assistants included Judge Freitas as treasurer, Mrs. Gregory Jones, William Rattray, organist at St. John's Episcopal Church; and the indispensable Kitty (Mrs. Melville) Oppenheimer. How much of their time and effort she cajoled and demanded will never be computed.

Dressed and carrying herself like some Edwardian empress, she would sweep into any gathering, launch her sermon on the unifying force of good music, and ostensibly answer questions. Her replies from the throne were prefaced by an affectionate but haughty "My Dear . . ." No doubts or arguments could prevail against such regal poise.

At last Maude and her allies had collected enough funds to schedule the first concert series.

The launching took place with Nelson Eddy on the rainy night of January 3, 1934, in the Fairfax Pavilion.

"Dressed and carrying herself like some Edwardian empress, she would sweep into any gathering, launch her sermon on the unifying force of good music, and ostensibly answer questions."

Success of the first concerts brought the requirement for a more permanent and spacious hall. This was solved when Maude appealed to her old San Francisco friend, Mother Raymond, of the Dominican Sisters, to build an outdoor theater opposite the College, in Forest Meadows. The Sisters furnished the concert platform and "shell", and the W.P.A. built the uncomfortable wooden seats.

The first concert was held there in September, 1934, again with Nelson Eddy, who was on his way to Hollywood stardom. Rain held off, with the aid of Dominican prayers, but when the concert began, Mrs. Jones says, "the benches began breaking up — you could hear them crashing all over Forest Meadows."

Star followed star at the annual series, now called the Marin Music Chest. John Charles Thomas, Helen Traubel, Jose Iturbi, Menuhin, Jan Peerce, Richard

Tucker, Artur Rubinstein, the San Francisco Ballet, the San Francisco Symphony under its various maestros — Monteux, Dobrowen. Rise Stevens gave an especially memorable concert. Ezio Pinza sang at Tamalpais High auditorium when it was too cold for outdoor performances. Paul Robeson, Isaac Stern, Dorothy Maynor, Tossy Spivakowski . . . and many young artists, who made their debuts before a major audience at Forest Meadows.

"The greatest music in the world, for the greatest number of people, at the lowest possible prices."

The impresario had one of her typical encounters with the Northwestern Pacific Railway because of this outdoor setting. On Sunday afternoons, there always seemed to be a train that whistled in the midst of an aria. After numerous interviews and countless "My Dear man", the NWP was prevailed upon, and the trains ran silent.

As the Chest propsered, it took the added responsibility, at Maude's urging, of providing cash scholarships for talented young musicians from Marin County. In most years, four scholarships were donated, varying with the organization's finances. Today several members of the San Francisco Symphony are former Marin Music Chest scholars, as is Hugo Rinaldi, conductor and director of music for the San Rafael schools.

"I received four consecutive $200 scholarships, starting in 1938," says Rinaldi. "Without that money, I could never had completed my musical education."

Other scholars include Jean Mitchell, Mill Valley cellist; Corwine Swall, Mill Valley singer; Marian Marsh, who recently made her Metropolitan debut; and David del Tredici, pianist-composer at Boston College, who will conduct his Bicentennial Symphony this summer for the Chest.

Maude handed over the reins of the Music Chest to younger subordinates in 1940, but her enthusiastic orations before each concert continued a tradition for many years. She died in 1964.

To scores of young people she was "Aunt Maude", an incalculable influence. To her family, she was "The Diva". That, says Hugo Rinaldi, is Italian for "the star, the top," and most appropriate for Maude.

Gould Coupler and Battery Plants Sold, Second Time in Five Weeks, for $14,000,000

Symington Co., Rochester, Manufacturers of Railroad Specialties, Acquires Depew Works From Charles J. Graham, Pittsburgh, Through a Group of Bankers Representing Charles J. Symington—Plans of New Owners Not Announced, But Gould Properties Will Remain Intact, It is Indicated.

By GEORGE W. FOSTER, Real Estate Editor.

The Gould Coupler Co. and the Gould Storage Battery Co. at Depew were sold yesterday for the second time within five weeks. It was reported in financial circles in New York that close to $14,000,000 is involved in the new transaction.

The Symington Co., Rochester, manufacturers of railroad specialties, acquired the Gould properties yesterday from Charles J. Graham, Pittsburgh, Pa. It is understood the Symington Co. will assume immediate control.

Buys Through Bankers.

Mr. Graham, vice-president of the Pittsburgh Bolt & Nut Co., purchased the Gould holdings from Com. Charles A. Gould of Buffalo December 31. He virtually confirmed the report at that time that he paid $12,000,000 for the two companies.

A group of bankers, including the Chase Security Co., Hambelton & Co., and Blair & Co., all of New York city, representing Charles J. Symington, president of the Symington Co., purchased the Gould interests from Mr. Graham. The negotiations have been in progress in New York for the past week.

G. H. Dietz, secretary to Com. Charles A. Gould, called The Courier yesterday from the main offices of the Gould Coupler Co., No. 32 East Forty-second street, New York city, announcing he was speaking for Mr. Graham, and dictated this statement:

"Charles J. Graham, vice-president of the Graham Bolt & Nut Co., Pittsburgh, Pa., who in December purchased the Gould Coupler Co. and Gould Storage Battery Co. from Com. Charles A. Gould, founder and president, announces that he has disposed of his holdings in the Gould Coupler Co. and Gould Storage Battery Co. to a group of bankers headed by the Chase Security Co., Hambelton & Co., and Blair & Co. Mr. Graham states that he understands the bankers to be acting for Charles J. Symington, president of the Symington Co. of Rochester."

Mr. Dietz said the sale had just been concluded and that he was not authorized to announce the consideration. Reports filtering through financial circles, however, placed the figures at "more than a million over the price paid by Mr. Graham when he acquired the property."

The Symington Co. works are located in Lincoln Park, Rochester. The company was founded in 1901 by E. H. Symington. It manufacturers specialities for locomotives, engines and general railroad equipment. The works cover a site of twenty acres, having one of the largest malleable iron furnaces in the country. Main headquarters of the company are at No. 233 Broadway, New York city.

What changes are contemplated in the operating and directing forces of the Gould companies, Symington Co. interests would not say yesterday. It is reported that the plants will be retained as individual units and that a merger, if carried out, would not be undertaken for at least a year.

When Mr. Graham assumed control of the Gould properties Commodore Gould retired as president. William S. Gould, his son, succeeded to that place.

Some Changes Indicated.

It was reported yesterday that Mr. Symington would become president and that Donald S. Barrows, vice president of the Symington Co., in charge of operations at the Rochester works, would be made vice president.

It is said Mr. Barrows will act as managing director of all the companies and that E. J. Mohr, now assistant to Mr. Barrows, would assume charge at Rochester.

Charles A. Gould II, grandson of Commodore Gould, is now treasurer of the Gould companies and Eugene Gray of New York city is secretary. John H. Patterson is in charge of operations at the Depew works.

Retention of some interest by the Goulds in the holdings at the time the companies were sold to Mr. Graham was said at the time to be instrumental in naming William S. Gould as president.

The Gould company was founded fifty years ago by Commodore Charles A. Gould. It manufactures couplers, journal boxes, friction gears, bolsters, end sills and automobile batteries.

The plants occupy a site of seventy-five acres at Depew, bounded by Neoga street on the east, Transit road on the west, D. L. & W. tracks on the north and the Erie railroad on the south. More than 2,500 men are employed in the works.

The companies were capitalized at $10,000,000 in 1905. The holdings in land and buildings have been increased about $5,000,000.

Mrs. Charles J. Symington Jr.

Mary Jo Finucane Takes Vows In Lady of Lourdes Church

THE ceremony yesterday at which Miss Mary Jo Finucane, daughter of Mr. and Mrs. Bernard E. Finucane of Ambassador Drive, became the bride of Charles J. Symington Jr., son of Mr. and Mrs. Charles J. Symington of Huntington, L. I., was marked by extreme simplicity. The wedding took place at 11:30 a. m. in Our Lady of Lourdes Church, where the Rev. John Reddington of Geneva received the vows.

The church was adorned simply with white gladioli and ferns.

The bride, whose father gave her in marriage, wore an unadorned dress of white taffeta. Rosepoint lace held her short veil and she carried bridal roses and stephanotis.

Her only attendant was Miss Carolyn Scott of Quaker Center, Scarsdale, who wore a blue net gown and carried yellow chrysan-

Lloyd Symington of Washington, D. C., was best man.

White roses decorated the home of the bride's parents, where the reception was held following the ceremony. Later, the couple left for a Southern trip.

The bride, who is a member of the Junior League of Rochester, was graduated from the Madeira School in Greenway, Va., and from Smith College. During the war, she served with the American Red Cross as a staff assistant in Italy.

Mr. Symington is a graduate of Groton Preparatory School and of Harvard University.

Symington—Platt

Announcement has been made by Mr. and Mrs. Charles J. Symington of 45 E. 62d St., Manhattan, and Lloyd Harbor, of the engagement of their daughter, Miss Ann Byrd Symington, to Thomas Collier Platt 3d, son of Mr. and Mrs. Platt Jr. of Laurel Hollow.

Miss Symington was graduated from St. Timothy's School in Catonsville, Md., and is a student at Bennington (Vt.) College. She is a granddaughter of the late Maj. W. Stuart Symington of Baltimore.

The bridegroom-elect is an alumnus of the Brooks School and Yale University, where he was a member of the Fence Club and Wolf's Head Society. He is attending the Yale Law School.

During the war he served as an ensign in PT Squadron 41 of the navy. Mr. Platt is a grandson of the late Henry B. Platt and the late Dr. Graham Lusk, former professor of physiology at Cornell University.

PRIVATE FUNDS TO GO ABROAD?

New York. —(AP)— An American planning group is trying to chart a course for private investment to help less-developed countries attain a self-sustaining economy.

Leaders of the National Planning association say this could:

Accomplish more effectively some objectives of the point four and United Nations programs; stem the drift toward socialism and communism, and spare the United States taxpayer the burden of continued grants and loans.

The association, a nonprofit, nonpolitical organization, announced Sunday it will make case studies of six or eight United States business firms it says have been "pioneering in a new program of private investment abroad."

Identity of the companies to be studied was not disclosed.

Chairman H. Christian Sonne of the association said it will try to make an impartial study of how these companies have improved social and economic conditions of the area in which they operate. And he added, "we hope to find a general pattern of their business practices, and to induce other companies to go into foreign countries and do likewise."

Charles J. Symington, chairman of the board of Symington-Gould corporation, heads a special policy committee composed of agriculture, business, labor and professional members of the N. P. A. trustees which will take charge of the project.

The case studies will be financed by a grant from the Carnegie Corporation of New York, by other foundations and business contributions. Director of research for the project is Eugene W. Burgess, former government economist and vice president of General Mills.

First of the studies is expected to be completed in the next few weeks.

Symington told a news conference here that "United States business has come to the realization that the ultimate success of foreign enterprises and the security of investments abroad depend to a large extent upon the benefits that accrue to the people of the host countries."

He said company practices which "are highly beneficial and acceptable to the local people" produce maximum rewards to both the countries and the companies. He added:

"If we could create some ground rules by means of which it would be possible to get United States private business, the United States government, and the governments of foreign countries — especially the less-developed countries — to agree on ways of exporting United States managerial skills as well as private investment, we would take long strides toward building a sounder world economy in double quick time."

Pointing out the need for the United States to import raw materials from abroad, Symington said that today there is more reason than ever before for the kind of enterprise the association will study.

"The vital question of peace or war," he said, "may well depend upon the bringing of competent, profitable and socially responsible development to the less-developed nations, as does the ultimate economic health of our own country."

Photo Card in Seconds

City Man Heads Firm of Great Potential

By DON RECORD

Democrat and Chronicle Financial Editor

CHARLES J. Symington Jr., who has been in business in the Rochester area for 14 years, has just been elected president of a new company which appears to have great potential.

It is the Dashew PhotoData Corp., which will have its headquarters here even though the principal owners are in Los Angeles and Jackson, Miss. A key to launching of the new company is development of a bi-camera, which can combine a photograph of a person and other data on a plastic card in less than a minute; then in another machine this card can be embossed and punched for electronic data processing systems.

It's Their Business

The resulting cards would be tamper-proof and would be especially valuable as auto licenses, for identification in large schools, industrial plants, military forces and other government departments, unemployment, liquor control boards, credit clubs and innumerable other uses. It would be sold on a basis of savings in time and costs, plus prevention of errors.

Dashew PhotoData Corp. is a joint venture of Dashew Business Machine Inc. of Los Angeles and School Pictures Inc. of Jackson, Miss. Dashew did much of the early work in the program and then combined with Jackson engineers to produce the equipment on a commercial scale at the Jackson plant.

Symington expects to have demonstrator models ready to show at the Department of Motor Vehicles Convention in Miami, Fla., starting Oct. 2.

PICTURES, PICTURES—Charles J. Symington Jr., left, president of Dashew PhotoData Corp., whose career has revolved around pictures, confers with W. Thomas Smith Jr., president of Eastern Division of School Pictures, Inc., on new identification card.

STARTING this new venture, Symington brings a record of business success as head of Rochester Laboratories, 950 Ridge Road, Webster, launched 14 years ago, greatly expanded and finally sold to School Pictures Inc. of Jackson, Miss. Then Symington became a vice president and director of that company and president and general manager of its Eastern Division. He resigned from the latter post in order to head Dashew PhotoData Corp., and was succeeded by W. T. Smith Jr. of Jackson.

Symington lived in Rochester as a baby, but grew up in New York City. He is the son of Charles J. Symington, then president of the Symington-Gould Corp., manufacturers of railroad equipment in Rochester and Depew. Charles Jr. is a first cousin of Missouri Sen. W. Stuart Symington.

The present Rochesterian graduated from Harvard in 1936 and Trinity College, Cambridge in 1938 with an M.A. in English literature. Then he went with an advertising agency in Chicago for two years, worked for a year in the Depew foundry, served five years in the Navy, then cast his lot with future growth of Canada. He established Lookout, Ont., a rather wild region, grubstaked prospectors flown into the wilds, carried hunting and fishing parties to their favorite grounds.

Then he married Mary Jo Finucane of Rochester, daughter of Bernard E. Finucane, now board chairman of the Security Trust Co. He took his bride to Sioux Lookout, but soon decided that business might be all right for a bachelor, but hardly civilized enough for a prospective father, so they returned to Rochester and looked around for another business.

His father-in-law was a director of the Kryptar Corp. and knew that this firm was about to divest itself of its former Technifinish operation, a mail order amateur photofinishing business, which had been highly successful before Kryptar went into the film manufacturing business.

* * *

SYMINGTON FORMED

Rochester Laboratories Inc. with James Wilmot and Claude Wright, bought the photofinishing business and set up shop in the former Winpro camera plant in Webster. Later he bought out his partners' interest and expanded into larger quarters.

Amateur photofinishing proved to be a highly seasonal business, so Symington looked around for other work for the winter season, thus got into the field of taking pictures of school children. He organized franchised photographers who contacted the schools, took the individual pictures and sent the negatives to Rochester for printing.

This business grew so fast that it soon far surpassed amateur photofinishing, and since the two did not operate too well together, Symington sold the mail order business to Carhart's and concentrated on the school field, for which he was equipped to process a million pictures a week. The average student bought a package of 20 pictures costing less than $3, or about as much as snapshots.

His biggest competitor was School Pictures Inc. of Jackson, Miss., which operated nationally but was anxious to increase its business in the East where Symington's operations were largely concentrated. They made such a good offer that he sold out to them, but continued to operate as president of the Eastern Division and vice president and a director of the parent company.

* * *

TWO EXECUTIVES, Thomas Greenwell, plant manager, and Mary Berard, production manager, who have been with the company almost since it was started by William J. Brown back in the 30's, are still highly important to the success of the business, which in peak periods requires 100 young women in processing the pictures.

School Pictures Inc. turned out approximately 100 million prints last year, about one-third of them in color. This year it looks as though 45 per cent would be in color. The company also manufactures cameras and other equipment. It recently offered 100,000 shares of its stock to the public at 9⅞ a share and at 9 to employes. This stock is now listed at $30 a share.

In cooperation with Dashew PhotoData, with use of the bi-camera and the regular School Pictures camera, the company plans to offer embossed photo identification cards along with the packets of pictures this year with prospects of greatly increasing the volume of the new product.

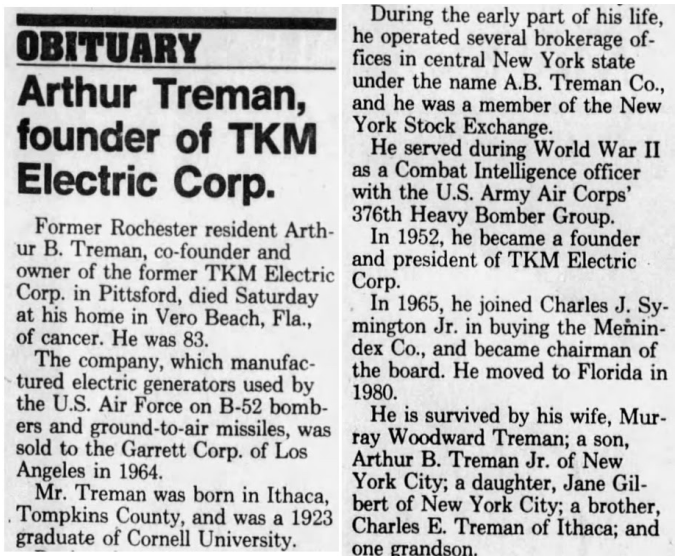
1965 (May) - Purchases Memindex Co. with Arthur Treman (founder and president of TKM Electric Corp.)

Article is from 1985; it is the passing of **Arthur Treman** : See full page at [HN004R][GDrive] .



OBITUARY

Arthur Treman, founder of TKM Electric Corp.

Former Rochester resident Arthur B. Treman, co-founder and owner of the former TKM Electric Corp. in Pittsford, died Saturday at his home in Vero Beach, Fla., of cancer. He was 83.

The company, which manufactured electric generators used by the U.S. Air Force on B-52 bombers and ground-to-air missiles, was sold to the Garrett Corp. of Los Angeles in 1964.

Mr. Treman was born in Ithaca, Tompkins County, and was a 1923 graduate of Cornell University.

During the early part of his life, he operated several brokerage offices in central New York state under the name A.B. Treman Co., and he was a member of the New York Stock Exchange.

He served during World War II as a Combat Intelligence officer with the U.S. Army Air Corps' 376th Heavy Bomber Group.

In 1952, he became a founder and president of TKM Electric Corp.

In 1965, he joined Charles J. Symington Jr. in buying the Memindex Co., and became chairman of the board. He moved to Florida in 1980.

He is survived by his wife, Murray Woodward Treman; a son, Arthur B. Treman Jr. of New York City; a daughter, Jane Gilbert of New York City; a brother, Charles E. Treman of Ithaca; and one grandson.

OBITUARIES

Charles J. Symington, 95, Retired Industrialist, Presidential Adviser

ALEXANDRIA, Va. (Special)—Funeral services for Charles J. Symington Sr., a native of Baltimore and retired industrialist and presidential adviser, will be held at noon on Thursday at the Christ Church here.

Mr. Symington died on Friday after a brief illness at the New York Hospital in New York City. He was 95.

Mr. Symington attended Amherst College. He served for many years as president and chairman of the board of the Symington Company. The firm was founded by his brother, T.H. Symington, during the early 1900's.

The company, which made steel castings for railroad equipment, had plants in Rochester and Depew, N.Y. During the 1920's the Symington firm acquired the Gould Coupler Company and later merged with the Wayne Pump Company to become the Symington-Wayne Corporation.

Throughout those changes, Mr. Symington remained as chief executive of the firm, which was a major defense contractor during both world wars.

He was elected a trustee of the General Theological Seminary in 1940, a position he held until 1957. The following year, 1941, he was elected a trustee of the Hospital for the Ruptured and Crippled, in New York. He remained in that post until last year.

In 1945, President Truman appointed him chairman of a committee which was convened to prepare the agenda for the National Labor Management Conference. During that period, Mr. Symington also served as an adviser to the Secretary of Commerce.

He became a trustee of the National Planning Association in 1958 and was elected chairman of that body in 1971 at the age of 88.

He was the uncle of Stuart Symington, the former senator from Missouri.

Mr. Symington married Elizabeth Lloyd in 1912. Mrs. Symington died in 1953.

Mr. Symington is survived by two sons, Lloyd Symington, of Washington, Charles J. Symington Jr., of Rochester, N.Y.; three daughters, Mrs. Sanford B. Kauffman, of Sharon, Conn., Mrs. David Mayer, of Williamsville, Vt., and Mrs. Thomas C. Platt, of Huntington, N.Y., 20 grandchildren and 10 great-grandchildren.

James Wadsworth Symington (/ˈ saɪmɪŋtən/; born September 28, 1927) is an American lawyer and politician who represented Missouri from 1969 to 1977 as a four-term member of the U.S. House of Representatives. Prior to that, in the late 1960s, he served as Chief of Protocol of the United States.

Biography[edit]

Youth, family, and education[edit]

Symington, son of Stuart (U.S. senator, Missouri) and Evelyn (Wadsworth) Symington, was born on September 28, 1927, in Rochester, New York. He is the great-grandson of James Wolcott Wadsworth (U.S. Congress, New York) and grandson of James Wolcott Wadsworth Jr. (U.S. Congress, New York) and great-grandson of John Hay. James attended St. Bernard's School in New York City, St. Louis Country Day School in St. Louis, Missouri. In 1945, he graduated from Deerfield Academy in Massachusetts and enlisted in the United States Marine Corps at the age of 17.[1] He served in the Marine Corps as a private first class from 1945 to 1946. Symington earned his Bachelor of Arts degree from Yale University in 1950 where he sang as a member of the Whiffenpoofs and the Glee Club.[2] He also joined Berzelius secret society (according to the 1950 Yale Banner). He graduated from Columbia Law School in 1954.

Early legal career and public service[edit]

After graduating from law school, Symington served for two years as Assistant City Counselor (1954–1955) for St. Louis. In 1958, Symington entered the United States Foreign Service and was posted to London as assistant to John Hay Whitney, the U.S. ambassador to the United Kingdom and his cousin once removed on his mother's side.[3] He served in this role until 1960, when he returned to private practice in Washington, D.C.. He served in a series of roles in government from 1961 to 1968: deputy director, Food for Peace (1961–1962); administrative assistant to Attorney General Robert F. Kennedy (1962–1963); director, President's Committee on Juvenile Delinquency (1965–1966); consultant, President's Commission on Law Enforcement and Administration of Justice (1965–1966); and Chief of Protocol of the United States (1966–1968).

Congressional career[edit]

In 1968, Symington was elected as a Democrat to the 91st Congress to represent Missouri's 2nd Congressional District. He served four terms in the U.S. House of Representatives from 1969 to 1977. While in Congress, he served on the House Commerce Committee and the Committee on Science and Technology, chairing the subcommittees on Space Science and Applications; Science, Research & Technology; and International Cooperation.

In the 1976 election, he chose not to seek his seat for a fifth term; rather, he made an unsuccessful bid for the Democratic nomination to fill the U.S. Senate seat vacated by his father, who retired after serving four terms. He faced Missouri Governor Warren Hearnes and Congressman Jerry Litton in the

Democratic primary. Litton won the primary but was killed when his plane crashed en route to the victory party. Hearnes was named the Democratic candidate and ultimately lost to Republican Party candidate John Danforth. At the end of his congressional term, Symington returned to the D.C.-based law firm Smathers, Symington & Herlong as a partner.

Post-congressional roles[edit]

Symington in 2001

Symington served as director of The Atlantic Council from 1986 to 2001, and as director of the Library of Congress Russian Leadership Program in 2001. In 1992, he founded the American-Russian Cultural Cooperation Foundation, which he chaired from its inception until 2015.[4][5] He also made occasional appearances as a singer.[6]

Symington appeared as a commentator in the 1990 Ken Burns film *The Civil War*.[7] As of 2001, he was practicing law with the law firm of Nossaman LLP/O'Connor & Hannan, where he specializes in legislative and administrative representation.[8][9] Symington is also a writer. A collection of his poems, songs, and prose, *A Muse 'N Washington: Beltway Ballads and Beyond* , was published in 1999.

Symington Machine Corporation

Full book video recording here : [HB000E][GDrive]

SYMINGTON MACHINE CORPORATION

The **Symington Machine Corporation** was a major manufacturer during WW I, producing British and Russian shrapnel from April, 1916 to March, 1917. The shrapnel was used in anti-aircraft and 75mm field guns. A new plant was built in 1917 to accommodate a contract for the manufacture of 3,000 75mm 1916 model field guns.

In addition to the manufacture of guns, the **Symington-Anderson Company** manufactured 500 6-inch trench mortars while the **Symington Forge Corporation** constructed a plant, which opened in 1917, to produce forgings for 75mm steel and shrapnel. By December, 1918 it had delivered 3,595,782 forgings to the military.

The Symington-Gould Corporation, headed by Charles J. Symington, was founded in 1924. The manufacturing plant was located at 20 Symington Place.

At left below, the diagram shows the internal structure of a shrapnel shell invented by British General Harry Shrapnel. Shrapnel, or shell fragments, resulted when an artillery projectile, provided with a bursting charge filled with lead balls, exploded in flight.

A 75 mm field gun is shown below. It was the major field piece used by the French and the Allied Expeditionary Forces during WW I. At right below is one of the 75 mm Mark IV shells produced by the thousands at Symington's Lincoln Park factory.

By the 1920s, the Symington-Gould Corporation was manufacturing railway equipment, draft gears, journal boxes and devices for railway cars, and steam and electric locomotives. They also produced a line of malleable iron castings.

Symington Wayne Corporation

Enthusiast notes about Symington Wayne Corporation

See [HW000O][GDrive]

It used to run at about 175 pounds for years. I expect the valves and rings are worn. But I cannot seem to find any information on this manufacturer or anything source for parts either.

This was not a fly by night company and I'm surprised that there is virtually no information available on these. What ever happened to the Wayne Pump Company of Wayne Indiana ? ? ?"

A vintage Wayne air compressor
[HW000P][GDrive]

Well, we did some research, and this may be part of the story, Ron:

> *"On June 11, 1943, the assets of Equipment Corporation were acquired by the Wayne Pump Company and moved to Fort Wayne, Indiana. Six years later [this would be about 1949], following the purchase of the company by* ***C.J. Symington [Charles Julian Symington (born 1883)]****, the Wayne Pump Company merged with the Martin & Schwartz Company from Salisbury, Maryland. Symington combined the field working group and the senior management group of Martin & Schwartz with the Wayne Pump Company name and location. In 1951, poor labor conditions and a strike in Fort Wayne forced Symington to move the Hose Reel Division and the Gasoline Pump Division back to Salisbury, Maryland, leaving the Air Compressor Division as the only product line left in Fort Wayne, Indiana.*
>
> *During the late 50's, the* ***Wayne Pump Company*** *name was changed to Symington – Wayne to include the Symington – Gould Company in Depew, New York. In the next ten years the* ***Symington – Wayne Company*** *would experience more changes than just its name. The following decade saw controlling interest change to* ***Dresser Industries****."*

[...]

Then, Who is Wayne-Vaughn Equipment?

Now, to complicate that a bit, this site has a post from another visitor about Wayne air compressors. It says "Wayne-Vaughn Equipment Company in Fort Wayne, Indiana sent me a PDF manual for mine (a Wayne air compressor), which is a model #5163HG. They only have the complete valve assemblies in stock. No other parts available. In the picture of the tag, the top number is the model# and the bottom number is the serial#. Number for Wayne-Vaughn parts is 877-655-6804 X-202. I talked to Tom and he was most helpful and quite patient. He told me about the history of my particular model (last made in 1950). Hope this helps. Good Luck

MERGER OKAYED FOR WAYNE PUMP

Directors of Firm and Symington-Gould Approve Linkup Plan

NEW YORK, Jan. 24 — (DJ) Directors of Symington-Gould Corp. and Wayne Pump Co. approved plans to merge the two companies through an exchange of stock, C. J. Symington, chairman of both concerns, announced today.

The combined company will be known as Symington Wayne Corp.

Completed terms of the merger call for the exchange of each Wayne share outstanding for 2-1-4 shares of Symington-Gould stock, plus an option to buy one additional Symington-Gould share at $10 a share in the first five years and $15 in the succeeding five years.

Holders To Act

The proposed merger will be submitted to a vote by stockholders of the two companies at special meetings March 11. Symington-Gould has outstanding 1,012,984 shares. Wayne Pump has 482,948 shares outstanding, of which 198,975 are already held by Symington-Gould.

Hynes Sparks, president of Symington-Gould announced earnings of the company in 1957 amounted to $1,011,304 equal to $1 a share compared with 1,211,977 dls or $1.20 a share in 1956.

W. H. Bateman, president of Wayne Pump, announced the company earned $817,709 equal to $1.98 a share in the year ended Nov. 30, 1957. This included $200,000 profit on the sale of former English plants, which have been replaced by new facilities, he said. In 1956 net income was $1,288,230 or $2.78 a share.

Mr. Bateman said it is contemplated that the merger will be completed before April 2.

Wayne Pump Merges

Bateman To Head New Corporation

William H. Bateman III, of Salisbury, was slated to be elected today to the presidency of a new multi-million-dollar manufacturing enterprise, the Symington Wayne Corp.

Symington Wayne is the result of a merger of Salisbury's Wayne Pump Co., which Bateman headed, with the Symington-Gould Corp., of Depew (near Buffalo), N.Y.

Symington - Gould, maker of steel castings and railroad equipment, had owned a controlling interest in Wayne Pump, maker (as most Salisburians know) of gasoline pumps of the kind used by service stations.

The merger was approved yesterday by stockholders of the two companies.

Directors of the new company were scheduled to hold their first formal meeting in New York City today, and it was at this meeting that Bateman was to be named president. His election was considered no more than a formality.

AT THE SAME time, Hynes Sparks, who had been president of Symington - Gould, was to be elected board chairman of Symington Wayne.

C. J. Symington, board chairman of Symington-Gould and elder statesman of the entire enterprise, was to become chairman of the executive committee of the new corporation's board of directors.

Bateman told the Times that, although Symington - Wayne will maintain executive offices in New York, he will continue to make his home in Salisbury and to keep his principal office here.

Corporate functions will be divided between Salisbury and New York, Bateman said, with the former being the head accounting office and the latter the chief sales office.

Yesterday's merger, effected through an exchange of stocks, is the latest of many in the last decade involving what was originally the Martin & Schwartz, Inc., of Salisbury, an old-line manufacturer of gasoline pumps.

In January of 1950, all stock in Martin & Schwartz was purchased by Symington-Gould.

IN NOVEMBER of 1951, Martin and Schwartz was merged with the Wayne Pump Company of Fort Wayne, but, company headquarters were transferred to Slisbury.

At the time of this merger, Symington - Gould owned about 32 per cent of Wayne's stock. Over the years, these holdings were gradually increased to about 43 per cent.

Meantime, Symington - Gould di- (See BATEMAN, Page 2)

versified in other directions. One of its recently acquired holdings was in the Oregon Metallurgical Company, a small firm manufacturing castings of relatively rare metals.

Yesterday's merger was expected to lead to operational economies, and, according to talk in financial quarters, would probably effect tax savings.

In a proxy statement issued prior to yesterday's stockholders' meeting, Wayne Pump officials declared:

"Each company is faced with particular problems because it is in a cyclical business primarily dependent upon one line of products for one industry, Symington-Gould on freight car castings for the railroad industry and Wayne on service station pumps for the petroleum industry; the merger will, it is believed, contribute to the solution of these problems . . . It makes available the combined resources and increase financial strength of both enterprises for future expansion and diversification."

With the dissolution of Wayne Pump as a corporate entity, the Salisbury area would lose its only representation on the New York Stock Exchange.

Wayne Pump stock closed on the Big Board yesterday at 20⅝. Symington - Gould closed at 8⅛.

Under the articles of merger, each share of Symington - Gould was to remain outstanding as one share of Symington Wayne, and each share of Wayne Pump was to be converted into two and a quarter shares of Symington Wayne.

There were 1,012,984 shares of Symington - Gould outstanding and 462,948 shares of Wayne Pump.

No changes whatsoever are now anticipated in the local plant's manufacturing operations.

The plant has recently been expanding its payroll to mass - produce a new kind of blending pump for which it has received a huge order from Sun Oil Co.

Merger Plans Win Approval

NEW YORK (AP) — Directors of the Symington-Gould Corp. and the Wayne Pump Co. announced Thursday that plans for merging the two firms have been approved.

Symington-Gould manufactures railway equipment specialties and castings. Wayne, with plants at Ironton, Ohio, Fort Wayne, Ind., Salisbury, Md., and Toronto, Ont., makes gasoline pumps and auto service station equipment. The merged company would be called the Symington Wayne Corp.

Net Off Slightly For Symington

Salisbury, Md., Jan. 29 (AP)—The Symington-Wayne Corporation said today in a preliminary report net sales for the year ended 1958 totaled $41,208,526 against $45,446,905 in 1957.

The net included operations of the old Wayne Pump Company from December 1, 1957, to March 12, 1958, when it was merged with Symington Wayne.

Net profit after taxes last year was $1,639,291 against $1,746,029 for 1957. The 1957 figure included a gain of $199,925 on the sale of its English plant.

Profit per share for 1958 was $1.02 against $1.09 in the previous year. Directors declared the regular quarterly dividend of 15 cents per share on capital stock payable next April 15 to stockholders of record April 1.

Stockholders Vote to Sell Globe Hoist

Stockholders of the Globe Hoist Co. voted at a meeting in Des Moines Saturday to sell operating assets of the company to the Symington-Wayne Corp., of Salisbury, Md.

The sale does not include the Globe Machinery & Supply Co. of Des Moines which will continue to operate as in the past.

The assets sold were valued at $1,800,000 to $2,000,000. The sale was reported to be primarily for cash.

Announcement of the sale was made by Frank Bredimus, of Philadelphia, Penn., president of the Globe Hoist Co.

Some assets of the Globe Hoist Co. were retained by the stockholders. They include the Globe Hoist Co. building in Des Moines and the Credit Acceptance Corp. of Des Moines.

Close D. M. Plant

Symington - Wayne will close the Des Moines plant which employs 60 persons. The Globe Hoist Co. has a total employment of 400 in three plants.

Symington - Wayne has rented the Globe Hoist building here for one year to allow time for moving fixtures and equipment to other plants.

The Globe Hoist Co. was founded here in 1936 by the late Fred W. Swanson, sr. It is the leading manufacturer of hoists in the world.

After Mr. Swanson's death in November, 1956, his son Fred W. Swanson, jr., became board chairman of the company. He died in January of this year at the age of 47.

Principal Holdings

Principal stockholders in the Globe Hoist Co. are Mrs. F. W. Swanson, jr., Mrs. Stratton Eller, Mrs. Joseph Davis, and Mrs. Richard Morgan, all of Des Moines, and the Globe Machinery & Supply Co. of Des Moines.

A newly formed corporation will operate the unsold assets and business under the continuing name of the Globe Hoist Co., it was announced. Plans call for the retention of present management.

Globe Hoist has factories and offices in Des Moines, Philadelphia and Long Beach, Cal. It owns controlling interest in Pacific Curtainwall, Inc., of Long Beach, Cal.

Station Hoists

The company manufactures automotive hoists for service stations and garages, and a line of materials handling equipment.

It was incorporated in 1936 as a successor of the manufacturing division of Globe Machinery & Supply Co., an old Iowa firm.

Here and Abroad

The Symington-Wayne Corp. has plants in Salisbury, Md.; Fort Wayne, Ind.; Ironton, Ohio, and Buffalo, N. Y. as well as in London, England; Rio de Janiero, Brazil; Toronto, Canada, and Capetown, South Africa.

Symington-Wayne manufactures gasoline station pumps and other equipment, railroad equipment and diversified pumps. Principal companies in the corporation are the Wayne Pump Co., which makes gasoline station pumps, and the Gould Pump Co.

Wayne Report Shows Sales Up, Profit Down

Directors of Symington Wayne Corp. learned in a meeting yesterday that although net sales the first nine months this year topped last year's comparable period, net profit and earnings per share declined.

W. H. Bateman, president of the firm here, announced that the directors have declared a regular quarterly dividend of 15 cents per share on the corporation's capital stock, payable Jan. 15, 1960 to stockholders of record Jan. 4, 1960.

Net sales for nine months ending Sept. 30 this year were $34,096,216, the report showed.

Although this was about $1,500,000 more than net sales for the same period in 1958, the corporation's net profit, after taxes, was down. The profit figures were $1,578,689 for the first nine months of 1958 compared with $1,479,328 for the same period in 1959.

Earnings for the period this year were 92 cents per share compared to 98 cents per share in the first nine months of 1958.

New Way to Buy Gas Introduced

A revolutionary way to buy motor gasoline is being initiated in the coastal area from Santa Cruz to Lompoc.

Dispensing seven grades of gasoline at seven prices, Hancock and Norwalk service stations report that for the first time motorists are offered fuels to fit their individual cars as well as their pocketbooks.

The West's newest gasoline marketing operations utilize a single "Econ-O-Blend" (Hancock) or "Power-Blend" (Norwalk) pump to dispense different fuels by a unique blending at the nozzle.

The principle of custom blending gasoline is similar to that of regulating hot and cold taps at a sink to get the desired water temperature from a single faucet.

To make it easy for drivers to find ideal fuels for their specific cars, charts posted in the Hancock and Norwalk stations list makes, models, and recommended blend numbers. Station attendants have been instructed to "sell down" to customers by suggesting that they keep trying the next lower blend until finding the most economical blend that gives good performance.

The pumps, manufactured by the Wayne Pump Company division of the Symington Wayne Corporation, reportedly offer the only new way to buy gasoline here in 25 years. Wide use of the pumps by other companies in the East and the Midwest has been highly successful.

1961 (Sep 22) - Buys Electrolite

Full page : [HN0044][GDrive]

Symington-Wayne Buys Tool Firm

NEW YORK — Symington Wayne Corp. announced yesterday that it had made an agreement to acquire the business and operating assets of Electrolite Corp., Defiance, Ohio, for a cash payment in an undisclosed amount.

Electrolite, in business for 30 years, is a manufacturer and national marketer of mechanics' hand tools.

W. H. Bateman, of Salisbury, president of Symington Wayne, said that the purchase of Electrolite is in line with his company's policy of diversification and growth by acquisition.

Electrolite's products will complement the hand tool line manufactured by Symington Wayne's subsidiary the Sherman - Klove Co., Chicago.

"With the acquisition," Mr Bateman said, "our corporation will have a broader line of hand tools and an increased participation in a business which has in the past been less subject than most to cyclical business trends."

In addition to the Electrolite plant in Defiance, Symington Wayne which manufactures petroleum, industrial and transportation equipment, has seven plants in the U.S. and seven abroad. The corporation has marketing offices in the world's principal trade centers.

Electrolite will continue under present management and will be operated as a wholly - owned subsidiary of Symington Wayne.

C. W. Schlooer, formerly executive vice president and general manager, will be president.

Pump Maker's Net Profit Off

NEW YORK — Symington Wayne Corp., Salisbury, reported yesterday consolidated net profits for the year 1961 of $1,705,593 or $1.05 per share on sales of $56,250,251.

Profits for the year 1960 were $2,169,364 or $1.35 per share on sales of $58,017,356.

The company attributed the lower earnings in 1961 to a sharp decline in its railroad steel foundry operations reflecting a depressed condition of the railroad business. The combined sales and profits of other company operations as a group were, however, ahead of 1960.

-:-

THE COMPANY had a substantial backlog of business on hand at the beginning of the year, including a recent order for approximately six million dollars for the company's blending pump.

On April 3, 1961, Symington-Wayne acquired for cash the Sherman-Klove Company in Chicago, Ill., manufacturer of socket wrenches and accessories and on Oct. 31, 1961, also for cash, Lectrolite Corp. of Defiance, O., manufacturer of flat wrenches and other mechanic hand tools. It was reported that these companies contributed very satisfactorily to overall corporation earnings during the portion of the year they operated as company subsidiaries.

The company also acquired on June 28, 1961, a majority inter-

est in Wayne Italiana, SPA, a leading manufacturer of gasoline service station pumps.

THE COMPANY announced yesterday that the board of directors had approved a proposed issue of about $5,000,000 of convertible subordinated debentures to be offered to the holders of common stock and stock purchase warrants of the corporation. It is expected that a registration statement covering the debentures will be filed with the Securities and Exchange Commission during February 1962.

The regular quarterly dividend of 20 cents per share was declared payable on April 16, to stockholders of record on April 2.

[HN0048][GDrive]

1965 (April 10) - NY Times - Mention of The "Symington-Wayne Corporation"

See [HN003H][GDrive]

Operations of the Symington Wayne Corporation last year resulted in rises in sales and earnings over those of 1963, it reported yesterday.

The concern, a manufacturer of gasoline pumps and service-station and railway equipment, showed net sales of $84,754,784, compared with $74,109,200 in 1963. Net income increased to $4,180,805, or $2.35 a share, from $3,176,642 or $1.75 a share.

Soviets, Bicoastal unit form venture

By BILL SHELTON
Tribune Business Writer

TAMPA — Link-Miles Simulation Corp., a subsidiary of Tampa-based Bicoastal Corp., has formed a joint venture with a Soviet nuclear power plant designer to build training systems and instruct operators in that country.

Link-Miles, a Maryland company that builds control-room simulators for nuclear power plants, said the partnership with the Soviets is an attempt to boost that country's dismal safety record at its 50 nuclear powered generating facilities.

"There's no question that the disaster at Chernobyl helped this joint venture move along," says Gill Grady, director of contracts at Link-Miles. "The Soviets want to make their plants safer."

In 1986, a fire in one of four reactors at Chernobyl, about 80 miles north of the Ukrainian capital of Kiev, helped spur a core meltdown and an explosion that released huge clouds of radioactive particles into the atmosphere.

At least 300 Ukrainians have died because of the disaster, and about 150,000 people show some effects of radiation poisoning, according to a Soviet parliamentary delegation.

Grady said the partnership, in which Link-Miles is the majority owner, is the first of its kind. The joint venture, called General Energy Technologies, includes NPO Energia, a division of the Soviet Ministry of Atomic Energy, Grady said.

The Soviet Union is planning 30 more nuclear power plants, and Grady said the government had intended to build a training simulator at each facility. In the United States, a simulator costs $10 million to $15 million.

"But it's beginning to look doubtful they would want to build one simulator for each plant," Grady said, "but there will be sever-

See U.S.-SOVIET, Page 3D

[HN0005][GDrive]

The Tampa Tribune, Wednesday, May 2, 1990

U.S.-Soviet business venture set

■ From Page 1D

al more planned."

Link-Miles already is under contract to build simulators for NPO Energia, Grady said.

"Although we're going to be working with the same customer, the difference now is that we're hoping to branch into the actual training of the operators," Grady said.

"We have the expertise to build simulators for Soviet power plants," he added. "They have the expertise to design the plants and the hardware."

Most business agreements with organizations inside the Soviet Union contain delicate payment agreements.

Payment to Link-Miles for the initial contract with NPO Energia would be in U.S. currency, Grady said. But payments to the joint venture would involve some trading partners that would deal in commodities of value on the world market.

"But possibly even more valuable than the simulation business itself," Grady said, "is the potential for our use of the relatively low-cost brainpower of Soviet engineers and scientists."

Grady said he couldn't speculate on other business possibilities with the Soviets but forecasted that the joint venture has a bright future.

Link-Miles' parent is Bicoastal Corp., a Tampa-based company owned by investor Paul Bilzerian. Bilzerian last June was convicted by a federal jury on nine felony counts stemming from stock transactions he made in 1985 and 1986.

Bicoastal, under Chapter 11 bankruptcy reorganization since last November, was formerly The Singer Co., which made aircraft and nuclear power plant simulators.

Link-Miles enters deal with Soviets

Venture will produce atomic-plant trainers

By Ted Shelsby

Link-Miles Simulation Corp. has formed a joint venture with a Soviet company to produce power plant simulators that could prevent a repetition of the 1986 Chernobyl nuclear accident, the Columbia-based company announced yesterday.

The Soviet Union has made "a big push" for Western-style power plant simulators since Chernobyl, according to Gilbert R. Grady, director of contracts for Link-Miles. He said the accident was blamed on operating error and might have been prevented with better training.

Link-Miles produces full-scale replicas of various control rooms used in power plants around the world. The simulators are used to train plant operators for normal operations and hone their skills in dealing with potential disasters.

The units are not just fancy look-alikes. They are connected to high-speed computers that "create" hundreds of different malfunctions or combinations of breakdowns, and it's up to the control-room operators to spot the problem and take corrective action.

Mr. Grady said that Link-Miles is investing between $500,000 and $1 million into a venture with NPO Energia, the Moscow-based organi-

Venture will make simulators for Soviet nuclear power plants

LINK-MILES, from 1C

zation responsible for the Soviets' operating nuclear power plants and for training personnel.

Link-Miles and NPO Energia will set up General Energy Technologies, a Soviet enterprise that will provide the Soviet Union and other Eastern European countries with power plant simulators, training and engineering services.

Mr. Grady said that the Soviet Union, which has about 50 nuclear power plants in operation and about 30 under construction, represents "the largest market in the world not yet tapped."

He said that the Soviets have simulators but that they do not match the quality of those built in the West because of a lack of high-speed computers.

Mr. Grady said the Soviets don't have the computer capacity to produce "real-time" simulators, in which an adjustment on the simulator would produce the same response, in the same amount of time, as it would on actual control-room equipment.

"When they push a button it takes a few seconds or a minute for something to happen," he said, indicating that this interferes with effective training.

Under terms of the new agreement, Link-Miles will also provide engineering services to assist General Energy Technologies in the construction of simulators.

To circumvent problems with the ruble, which is not freely convertible to Western currency, Mr. Grady said that Link-Miles "has a trading partner in New York that is experienced in countertrade." To extract Link-Miles' profit, he explained, the trading company will pick from a list of Soviet products, including such commodities as lumber and titanium, that it can sell in the world market and convert to dollars or other hard currency.

Link-Miles is a division of Tampa, Fla.-based Bicoastal Corp., formerly the Singer Co.

B18 THE EVENING SUN FRIDAY, MAY 4, 1990

Columbia firm to produce simulators for Soviets

Associated Press

COLUMBIA — Link-Miles Simulation Corp. announced it has entered into a joint venture with a Soviet organization to produce nuclear power-plant simulators that could prevent a repeat of the 1986 Chernobyl nuclear accident.

The Soviet Union has made a big push for Western-style power plant simulators since the Chernobyl accident, said Gilbert Grady, director of contracts for Link-Miles.

Grady said the Chernobyl accident was blamed on operator error and might have been prevented with better training.

Link-Miles produces full-scale replicas of various control rooms used in power plants around the world which are used to train plant operators for normal operations and hone their skills in dealing with potential disasters. The simulators are connected to computers that create hundreds of different malfunctions or combinations of breakdowns operators must deal with.

Grady said Link-Miles is investing between $500,000 and $1 million in the joint project with NPO Energia, the Moscow-based organization responsible for operating Soviet nuclear power plants and training personnel.

The new venture will be known as General Energy Technologies and based in Moscow. It will provide the Soviet Union and other Eastern European countries with power-plant simulators, training and engineering services, he said.

Grady said the Soviet Union, which has about 50 operational nuclear power plants and another 30 under construction, represents the largest untapped market for simulators in the world.

Grady said the Soviets are not able to produce real-time simulators, which would work at the same speed as actual control room operations, because of a lack of high-speed computer technology.

"When they push a button it takes a few seconds or a minute for something to happen," Grady said.

Because the ruble is not convertible, Link-Miles will choose from a list of Soviet products, including commodities such as lumber and titanium, that it can sell on world markets to extract its profit, Grady said.

nothing on the shelves. And the situation becomes panicky."

A Soviet highway to heavens: American to be sent to Mir

By Harry F. Rosenthal
Associated Press

Washington, D.C.
Somewhere in the United States, a company is sitting on what it had hoped would remain a big secret: It has contracted with the Soviet Union to send an American to the space station Mir.

The secret is trickling out, but the company isn't ready to say much. It had hoped to make a big announcement in January.

"We executed a contract with NPO Energia, which is the manned part of the Soviet space program," said Art Dula, whose Space Commerce Corp. in Houston markets Soviet space services in the United States.

What company is paying for it and why? Dula wouldn't say, explaining that secrecy is part of the contract.

The Soviets — for a hefty price — have taken passengers from a number of nations aboard their space station. They have included a Frenchman, a Cuban, an East German and, this month, Japanese journalist Toyohiro Akiyama.

But there's never been an American.

The weekly newspaper Space News was the first to reveal the secret, with only the sketchy information that the unnamed company's cost will be more than the $12 million

Space deal continued on page 7D

Star Tribune/Friday/December 14/1990 7D

Spotlight/Soviet trade

Space deal Continued from page 1D

the Tokyo Broadcasting Service paid to the Glavkosmos space agency. Other news accounts then repeated that information.

Dula's associate, Bill Wirin of Colorado Springs, Colo., said Space Commerce Corp. signed the deal Nov. 30 in Moscow.

"Our company policy is that we never discuss what we are doing without approval from our partners," he said.

Wirin called the contract "another sign of the warming relationship between the Soviets and the United States on a commercial basis, at a time when the U.S. is talking about giving them food."

Wirin, like Dula, said he'd like to say more. But he referred calls to Brown, Nelson and Associates, a Houston public relations company.

"This company has a big announcement to make, but the plan was to make that announcement in January," said Guy Brown, one of the principals in the public relations company. "The client doesn't want to be disclosed by name. It's an American company. I'd like to disclose more, but I'm under a restriction from them."

Brown said the company would select the American, but would not say for what purpose.

"One check has passed hands, probably earnest money," Brown said. "It's pretty much a fait accompli."

2 Americans make pitch for Russian space sales

Technology is tops, but buyers cautious

By Douglas Birch
Staff Writer

HERNDON, VA. — Attention, shoppers!

Want to buy the most powerful booster rocket ever built, a 20-story behemoth that could toss five tractor-trailers into orbit? Have at least $15 million to spare for a round-trip ticket to Mir, Earth's only space station and zero-gravity resort?

Well, Jeff Manber and Chris Faranetta are the guys to see.

They are vice presidents and salesmen for Energia USA, a wholly-owned subsidiary of NPO Energia of Kaliningrad, the design arm of the former Soviet Union's ambitious space empire.

These two red-blooded young Americans have been hawking Russia's tried-and-true space hardware, services and expertise since shortly before Energia USA opened its four-person office here six weeks ago.

And, though they haven't sold anything yet, they are eager to deal.

"The collapse of the Soviet Union is contributing, accelerating, forcing connections to take place where it looked like none would take place," says Mr. Manber, 37, a Northwestern University graduate who formerly toiled on Wall Street and for the Department of Commerce on commercial space issues.

But don't come to Energia USA's sparsely-furnished offices on Innovation Avenue here, expecting to pick up a couple of spaceships for pocket change. And please don't use the phrase "fire-sale prices," as certain newspapers have.

"If you say to a Russian, we want this at 'fire-sale prices,' forget it. He won't deal with you," says Mr. Manber.

"Is $15 million for putting a cosmonaut into space a 'fire-sale price?' " demands an indignant Katya Syromyatnikova, the office's 21-year-old student intern from Moscow State University, who sits at an old drafting table translating technical documents.

Energia USA hopes to help the Russian space industry turn a profit by encouraging Western investment and by selling technology, data and expertise to the National Aeronautics and Space Administration, aerospace and other companies.

Where will NPO Energia's profits eventually go? Good question, the

See **DEALING**, 15A, Col. 1

SUNDAY, APRIL 12, 1992

Selling Soviet spaceware tough for U.S. agents

DEALING, from 1A

salesmen say. The Russian state seems to own the company. But what about the Commonwealth of Independent States? And should the organization go private? These questions must still be sorted out.

Then there's the issue of patents. A lot of Soviet space technology was secret and never protected. Now NPO Energia is busy applying for patents and trying to figure out who should share in any royalties. Meanwhile, there is the danger foreign businesses will pilfer the technology.

While NPO Energia is famished for hard currency, the salesmen insist there are no plans to sell off huge assets such as the Mir.

"It's been frustrating for us," Mr. Manber says. "The [media] stories implied that the whole Mir space station is somehow for sale."

"It's available for lease, though," says Mr. Faranetta, 30, a space buff who started working with the Russians at his previous job with a nonprofit research organization, the Space Studies Institute of Princeton, N.J.

Energia USA, created this year, has yet to sign a contract. But a couple of U.S. corporations have already struck small-scale commercial deals with the Russian space program.

Twice since 1989, Payload Systems Inc. of Massachusetts has used Mir to grow pharmaceutical crystals free of the Earth's distorting gravity.

Tourists can even reserve accommodations aboard the space station. But Club Mir doesn't come cheap. Germany paid $15 million to put one of its citizens in Mir for eight days in March, while a Japanese television network paid $12 million to send up a journalist in December 1990.

One of the chief goals of Energia USA is to persuade NASA to buy the Energia rocket, the largest and most powerful vehicle ever built by humans, capable of blasting enormous payloads into orbit.

NASA is looking at using a heavy-lift vehicle to help send aloft pieces of the planned Space Station Freedom, but designing and building one of its own could cost $15 billion, the salesmen estimate.

Instead, Mr. Faranetta suggests, the agency could buy the technology, tools and consulting services needed for a U.S. aerospace company to build its own version of the Energia. That, Mr. Manber said, could save NASA up to $9 billion.

But selling this project is a delicate task.

There are lingering suspicions in the Bush administration about dealing with the United States' former nemesis. NASA has seemed lukewarm about buying Russian spaceships and rockets. U.S. aerospace companies also seem concerned about encouraging a major new competitor and don't want to make the White House mad.

So far, NPO Energia officials say, they have a "yellow light" on space sales. They are looking for the light to switch to green at the June 16 summit between President Bush and Russian President Boris N. Yeltsin.

For the Russian organization, though, space is not the final frontier. NPO Energia is already diversifying, in classic capitalist fashion.

The building in Kaliningrad where Sputnik was built now houses factories producing robotic artificial limbs and food processors. The organization also builds custom-made aluminum hulls for racing sailboats.

The thrust, nevertheless, is still outward. NPO Energia is proposing to replenish the ozone being stripped out of the upper atmosphere by man-made chemicals, build orbiting space spotlights to illuminate cities in emergencies and deploy spacecraft powered by solar sails.

Mr. Manber and Mr. Faranetta are now trying to persuade NASA to buy a three-seat Soyuz space capsule for use as a kind of lifeboat for the crews of Space Station Freedom.

The rescue craft would be ready to rocket astronauts back to Earth in case of a failure of life-support systems or other emergency.

NASA could spend up to $2 billion and several years designing and building its own rescue craft, specialists say. Some U.S. space experts think that, with some hard bargaining, NASA could buy a modified Soyuz for just $10 million.

That, Energia USA and some congressional allies argue, could help keep down the cost of the space station, now estimated at $30 billion.

But the pace of negotiations has been slow, and not just because the U.S. government is cautious.

"United States corporations are used to doing business in microseconds," Mr. Manber says. "The Russians move at a different pace. They just do. Time is not yet money to them."

Sometimes, cultural differences threaten to derail negotiations.

"Americans tend to ask more questions," Mr. Manber says. "Russians tend to take that as an insult to their integrity."

Despite the obstacles, the two salesmen said they expect Energia USA to succeed. They see themselves as commercial pioneers helping Russia preserve its rich space heritage with American capital.

"We're painfully aware that this has to be done right," Mr. Faranetta says.

"There are no road maps; there's no guidelines," Mr. Manber adds.

B18 THE EVENING SUN FRIDAY, MAY 4, 1990

Columbia firm to produce simulators for Soviets

Associated Press

COLUMBIA — Link-Miles Simulation Corp. announced it has entered into a joint venture with a Soviet organization to produce nuclear power-plant simulators that could prevent a repeat of the 1986 Chernobyl nuclear accident.

The Soviet Union has made a big push for Western-style power plant simulators since the Chernobyl accident, said Gilbert Grady, director of contracts for Link-Miles.

Grady said the Chernobyl accident was blamed on operator error and might have been prevented with better training.

Link-Miles produces full-scale replicas of various control rooms used in power plants around the world which are used to train plant operators for normal operations and hone their skills in dealing with potential disasters. The simulators are connected to computers that create hundreds of different malfunctions or combinations of breakdowns operators must deal with.

Grady said Link-Miles is investing between $500,000 and $1 million in the joint project with NPO Energia, the Moscow-based organization responsible for operating Soviet nuclear power plants and training personnel.

The new venture will be known as General Energy Technologies and based in Moscow. It will provide the Soviet Union and other Eastern European countries with power-plant simulators, training and engineering services, he said.

Grady said the Soviet Union, which has about 50 operational nuclear power plants and another 30 under construction, represents the largest untapped market for simulators in the world.

Grady said the Soviets are not able to produce real-time simulators, which would work at the same speed as actual control room operations, because of a lack of high-speed computer technology.

"When they push a button it takes a few seconds or a minute for something to happen," Grady said.

Because the ruble is not convertible, Link-Miles will choose from a list of Soviet products, including commodities such as lumber and titanium, that it can sell on world markets to extract its profit, Grady said.

Maryland businesses woo Soviets

Columbia firm's pact leads to joint venture

By Liz Atwood
Evening Sun Staff

The United States has postponed its arms summit in Moscow. European countries are considering suspending economic aid to the Soviet Union. And American lawmakers recently passed resolutions condemning the Soviets for the military crackdowns in Lithuania and Latvia that left 19 people dead.

But Maryland businesses are going ahead with plans to invest and trade in the Soviet Union.

"If we survived the Afghanistan embargo, then this time we can stay in business," said Mark Selawry, project manager with the Argus Trading Co., which exports to the Soviet Union equipment to manufacture circuit boards.

U.S.-Soviet relations are far different today than in 1980 when Jimmy Carter imposed a trade embargo on the Soviets for their invasion of Afghanistan. While Ronald Reagan lifted the grain embargo in 1981, he placed new economic sanctions against the Soviet Union for the repression of Poland. Those sanctions lasted until Mikhail Gorbachev came to power in 1985.

This time, "basically business is going on as usual," Selawry said. On Jan. 20, when Soviet troops charged a Latvian police station, Argus concluded a deal in the Latvian capital Riga to import equipment to repair circuit boards.

Columbia-based S3 Technologies is preparing to enter the second phase of an agreement with the Soviet Union to build nuclear power plant simulation systems. Nancy Ryan, a spokesman for the company, said workers soon will be traveling to Moscow to install the systems, which are used to train nuclear power plant operators.

So successful have relations been between S3 Technologies and the Soviet organization that oversees nuclear power plant operations that the two have formed a joint venture called General Energy Technologies. This new company will help establish technology training programs in

See SOVIET, B11, Col. 1

[HN000R][GDrive]

Maryland firm seek business in Soviet Union

SOVIET, From B1

the Soviet Union. So far, neither the joint venture nor the original contract has been adversely affected by recent events in the Soviet Union, company officials said.

One Baltimore-based organization has not been so fortunate, however. The American Center for International Leadership finds its existence in jeopardy after a major conference scheduled for Leningrad was canceled two weeks ago.

The center, which moved to Baltimore last April and employs nine people, is designed to promote understanding between business and government leaders from the United States and other countries.

Stephen Hayes, president of the center, said 150 American business and government leaders were supposed to fly to the Soviet Union, but the trip was canceled after a number of the participants changed their minds about going. Hayes said concern over the Persian Gulf war was the main reason for the cancellations, but the violence in the Baltics was also a factor.

The center currently is working to reschedule the conference.

Although Hayes said the cancellation of the event threatened the very existence of the center, recent talks have been encouraging. The tensions in the Baltics appear to have eased and the center now is considering taking at least part of the group to the Soviet Union. "It's just starting to turn around, but we're not out of the woods yet," he said.

Even in good times, business with the Soviet Union can be risky. Besides dealing with the usual difficulties of communication, business leaders also must figure out with which government entity to deal. Selawry said even a company such as Argus, which has been trading with the Soviet Union since 1981, has had trouble recently collecting its bills from the Soviets.

Argus concentrates its work in the Soviet Union and Eastern Europe, but lately has been curtailing its activities in the U.S.S.R., he said.

Robert Babcock, a Columbia builder who has been working on projects in Moscow, said he was not surprised at the recent turn of events in the Baltics.

"It's been going on for 11 months," he said. "Gorbachev keeps trying to tell them [the Baltic states] not to be independent . . . Gorbachev had to do something."

Babcock said that, while he regrets the bloodshed, he believes the United States should go ahead with plans to export grain as a means to improve trade relations.

"The largest consumer front in the entire world has just opened up," he said.

Although there is risk now, he said he expects in 10 to 15 years the market will be "incredible."

For now, however, many Maryland companies are moving cautiously, said Robert McDonald, with the Maryland International Division, a state agency that promotes foreign trade.

"Business relations with Maryland companies and the Soviet Union are in the formative stages," McDonald said.

Maryland has entered into several trade and exchange programs with Russia — the Soviet Union's largest republic — but has not made any agreements with Baltic states or the Soviet government itself, he said.

So far the Baltic events have not affected any of the state's trade agreements or exchange programs, said Robert Walker, deputy secretary for the Maryland Department of Agriculture.

"At this point, nothing has been adversely affected, but clearly events in the Baltic states cause additional concern," he said.

Maryland has participated in several agriculture exchanges. In April, the state is to play host to Soviet veterinary students and aquaculturalists. The Maryland Department of Agriculture is looking for state farmers interested in spending two weeks in the Soviet Union.

Walker said he doesn't anticipate any problems with those exchanges, and pointed out that such exchanges can contribute to the democratization of the Soviet Union. Should the U.S. State Department so advise, Maryland would postpone the programs, Walker said.

"That part of the world involves a lot of risk," Walker said. "There's a lot of interest, but also a lot of reluctance."

Hoping to reassure Maryland businessmen, Moscow Mayor Gavriil K. Popov visited Baltimore last week. Popov met with several businessmen hoping to work out a housing construction agreement.

The mayor said he was concerned that the events in the Baltics could harm business negotiations, but he said the Soviets want to be flexible. "There is a pervading line of cooperation," he said.

Nuclear plant safety brightens future for simulator maker

By Erik Nelson
Staff writer

In the past year, S3 Technologies of Columbia has created 50 new jobs feeding on an industry that isn't growing at all in the United States: nuclear power.

S3, which manufactures simulated nuclear power plant control rooms, was among seven companies recognized by the Greater Baltimore Committee with its 1991 Venture Awards Thursday for helping strengthen the local economy by investing in new jobs and equipment.

Although the $50 million-a-year company has yet to gain the name recognition of county-based companies like the Rouse Co. or the Ryland Group, it has grown enough in three years to make it one of the county's largest employers with a staff of 440. The company opened in Howard in 1982 with less than 50 employees. In June, it moved into a new 160,000 square-foot building off Dobbin Road.

Despite the recession and despite the halt of nuclear power plant construction in the United States, the company has flourished largely because of concerns about the safety of nuclear power.

In fact, said Gill Grady, the company's director of contracts administration, the company's major expansions were triggered by reaction to accidents at Three Mile Island and Chernobyl.

S3 currently is awaiting Soviet government approval of a contract for four Chernobyl-type reactor simulators, and Chernobyl is a potential site for one of them, said Grady.

He said that the recent upheaval in the Soviet Union and financing problems have delayed that approval.

The simulators cost from $10 million to $12 million in the United States. But reactor control rooms overseas tend to be larger, so simulators can fetch prices between $15 million and $20 million.

After the worst U.S. nuclear accident, at Three Mile Island in 1979, the Nuclear Regulatory Commission required all nuclear plants to have simulators identical to their control rooms.

General Public Utilities Nuclear Corp., which runs the TMI plant, had used a generic simulator that did not exactly match its control room, Grady said.

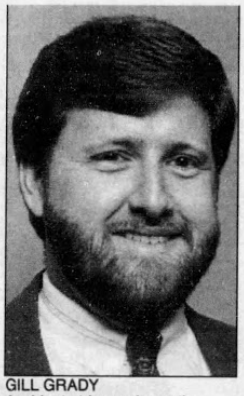
The NRC grants licenses based on how well operators perform on a simulator.

Of the country's 77 nuclear-reactor-equipped facilities, 76 have simulators and 40 of those were made by S3.

On April 26, 1986, an explosion and fire at Chernobyl in the Soviet Union's Ukrainian republic spewed radiation around the world and caused at least 32 deaths in nuclear power's worst disaster.

The Chernobyl accident sparked concern for nuclear plant safety worldwide, and orders for S3 simulators increased. Of 49 simulators outside the United States, 30 were made in S3's Columbia facilities.

THE HOWARD COUNTY SUN — ALGERINA PERNA
Simulator engineers (from left) Dr. Abdollah Abtahi, Richard Libra and Homa Ghandforoush work at a nuclear power plant control room simulator.



GILL GRADY
Accidents triggered growth

The company has already produced two nuclear plant simulators in a joint venture with the Soviets' All Union Research Institute for Nuclear Power Operations, which trains plant operators. It has also done business with Germany, Sweden, Finland and Taiwan.

While simulators have made operators better prepared for some emergencies, there is a limit to their training.

Because there has never been a meltdown in this country, the simulators can't reproduce the effects of one.

"You can go up to a certain point in an accident, and then no one knows what happens," Grady said.

The company buys the same equipment used in a control room and hooks it up to computers that simulate the way reactor cores, turbines, cooling systems and other components of a nuclear power plant react to commands from the control room.

In fact, what a student on a simulator sees during a malfunction such as a stuck coolant valve is the same thing an operator would see in a control room.

"You can teach the operator to respond to emergency situations," Grady said.

Although no new nuclear plants have been built in the United States in several years, utility companies are now upgrading their simulators with newer, more accurate software and state-of-the art hardware, some of which is manufactured by S3.

Nuclear plant simulators make up about three-quarters of S3's business, which has always involved simulators of some sort.

Its earliest incarnation was a company called Engineering Research Corp., in Prince George's County. The company made flight simulators for the Navy after World War II, and was influenced by simulator inventor Ed Link, whose name was attached to the company years later when it became Link-Miles Simulation Corp.

The company went through several ownership changes, including a purchase in 1968 by sewing-machine maker Singer. Singer owned Link-Miles for 20 years. It sold the company in 1988 to an entrepreneurial partnership, which in turn sold the sewing machine division and adopted the name Bicoastal Corp.

Link-Miles switched its name to S3 last year. The name stands for simulation, systems and services.

Although Bicoastal still owns S3, "we basically operate on our own, which has been really good for us," Grady said.

The company also makes simulators for large systems such as oil refineries and fossil-fuel power plants, as well as small vocational simulators for heating and cooling systems and gasoline and diesel engines.

Venture Award recipients

Over the last year:

- **Communications and Systems Specialists Inc. (CSSi),** a Columbia computer hardware and software developer, expanded its staff 44 percent to 52 employees, bought $18,000 worth of equipment and increased its space 25 percent to 14,548 square feet;
- **Martek Corp.,** a Columbia biotechnology firm, expanded its staff 13 percent to 34 employees, bought $600,000 worth of equipment and doubled its sales;
- **New Horizons Diagnostics Corp.,** a Columbia biotechnology firm, expanded its staff by 22 percent to 39 employees, bought $100,000 worth of equipment and expanded its space by 33 percent;
- **Larriland Farm Inc.,** a Woodbine farm and produce retailer, expanded its staff by 28 percent to 50 employees and bought $70,000 worth of new equipment;
- **Nixon's Farm,** a West Friendship farm and conference retreat, increased its staff from 7 to 12 and purchased $120,000 in new equipment;
- **Nucletron Corp.,** a Columbia biotechnology firm, expanded its staff 25 percent to 50 employees, bought $80,000 worth of equipment and increased its space 20 percent to 6,500 square feet; and
- **S3 Technologies,** a Columbia maker of system simulation equipment, expanded its staff 13 percent to 440, expanded its equipment inventory 35 percent and increased its space 52 percent to 160,000 square feet.

The awards, which recognize the "initiative, ingenuity and entrepreneurial spirit" of these growing companies, is sponsored by the Greater Baltimore Committee and supported by the Howard County Office of Economic Development.

The Baltimore Sun (Baltimore, Maryland) • 24 Mar 1992, Tue

DATELINE: MOSCOW

In a city full of brick walls, you need guide for survival

By Kathy Lally
Moscow Bureau

FOREIGN CLOSEUP

MOSCOW — Carole D. Frank arrived here from Columbia, Md., in June and ran straight into a brick wall.

Mrs. Frank works in Moscow as a psychological counselor for foreigners who are trying to make sense of life in this fascinating, but illogical and often maddening city.

Like many of her clients, she is the kind of person who relishes taking on a job and getting it done.

Moscow has brick walls especially designed for such people. Try to get something done in Moscow. Just try it. Try, for example, to make a telephone call, Mrs. Frank said.

"First, there's no phone book," she said. "Then the phone doesn't work." Sometimes you pick up the phone and before you even try to dial there's a busy signal. There might as well be a little sign popping out of the receiver admonishing, "Don't even THINK of telephoning today."

"Then the phone works and I can't hear you, but you can hear me," Mrs. Frank said, "and I call back and I can hear you, but you can't hear me." And then just when you can hear each other you get cut off.

If it's that hard to make a telephone call, imagine the difficulties in clinching a business deal in a country where the banks have more abacuses than computers.

Point 1 of Mrs. Frank's Moscow Survival Guide comes in here: Forget about being goal-oriented; better to drift with the current.

And Point 2: Be willing to fail because you will.

Here, Mrs. Frank likes to tell her briefcase story.

One day, she left her briefcase on the subway. Unfortunately, some honest person found it and turned it in. After hours of traveling to one station and wading through torrents of Russian with the help of a friend who translated by phone, she was told the briefcase had been sent to another station.

Once there, she was refused the briefcase because she had to fill in a form requiring the number of her Soviet passport. Of course, she didn't have a Soviet passport. More shouting. She begged to be allowed to leave without the briefcase.

"It was an inexpensive plastic one," Mrs. Frank said. "I never wanted to see it again."

She was forbidden to leave without it. She couldn't leave with it. Finally, the bureaucracy relented. A beaten Carole Frank trudged home, briefcase in hand.

Mrs. Frank tells this tale with the relish of a survivor. Unfortunately, many of her clients are not. Half of them are so far gone by the time they see her, they give up and return to the countries from which they came.

Personally, Mrs. Frank looks on the bright side.

"I have more friends than I've ever had in my life," she said, enumerating the advantages of being here. "It's wonderful to work in such a fascinating place.

"And if someone told me I could leave tomorrow, I'd be out of here in a minute."

She laughs at this self-revelation. It only proves Point 3 of her Moscow Survival Guide:

Have a sense of humor.

Mrs. Frank is here because of her husband, Tony, who works for S-3 Technologies in Columbia. Mr. Frank is part of a team from Columbia helping Russians build a nuclear reactor simulator to train nuclear power plant workers.

He is here for a year or more (until the contract is completed — and knowing Moscow that could be a lifetime.)

"He's trying to build a nuclear reactor simulator in a place that doesn't have a copying machine," Mrs. Frank said.

To join her husband, Mrs. Frank gave up a job she loved in the eating disorders unit at Baltimore's Mercy Medical Center. In Moscow, she is coordinator for the mental health grant at the U.S. Embassy and provides counseling at a clinic that cares for foreigners.

Life here, she said, is like anywhere else — only more so: "Anything that would normally happen is exacerbated by being in Moscow."

And it draws exactly the wrong kind of person, she said, the hard-driving Type A personality who runs full speed into one brick wall after another.

"I keep reminding myself this is a time I'll always remember," Mrs. Frank said, managing a cheerful smile — wiping the brick dust off her brow.

S3, German partner land two contracts

If you're tired of those old, run-of-the-mill computer games and have a few dollars to spare, you might want to give **S3 Technologies** in Columbia a call.

S3 builds computer-driven replicas of nuclear power plant control rooms, which are used to train operators. Last week, S3 announced that it and partner **Siemens AG** of Germany received two contracts worth over $55 million for simulators in Germany.

Kraftwerk-Simulator-Gesellschaft MbH is buying three simulators replicating control rooms and operations at three plants. Two of those will be built in S3's Stanford Boulevard manufacturing facility.

The second contract is from **Hamburgische Electricitats-Werke AG**, for a replica control room; it includes an option for a second unit this year.

S3 Technologies is a unit of Florida-based **Bicoastal Corp.**

S3 purchase deal means firm will stay in Columbia

Simulator company employs 300

By James M. Coram
Staff Writer

Howard County officials were celebrating yesterday the success of their plans to keep Columbia-based S3 Technologies and its 300 employees.

They had feared that Simulation, Systems and Services Technology Co., as S3 Technologies is officially known, would be sold to a foreign investor and moved abroad.

Instead, the contract buyer, ManTech International Corp. of Fairfax, Va., plans to keep S3 Technologies in Columbia and operate it as wholly owned subsidiary once it purchases the company Aug. 31, said Michael J. Cromwell III, executive vice president of ManTech.

ManTech, a 25-year-old privately held company that supplies defense, aerospace, environmental and intelligence technology to federal agencies, signed a purchase agreement July 29.

The agreement calls for ManTech to buy all of S3 Technologies' stock from BiCoastal Corp. of Tampa, Fla. BiCoastal had filed for bankruptcy. Mr. Cromwell declined to reveal the purchase price.

Although S3 Technologies' sales have fallen since 1991, when the nuclear power simulator company was making $50 million a year, it is still profitable, with sales in the $36 million range in 1992, Mr. Cromwell said.

ManTech was looking to expand into a commercial market internationally and S3 Technologies was an ideal instrument, Mr. Cromwell said. "It is a world leader in utility simulation in Germany, Taiwan, Korea and Russia," he said, areas where Man-

MANTECH

From 1B

Tech already has a foothold.

"Technically, what S3 does is first cousin to a number of things that we do in the simulator area," he said. "We have desk-top simulators for the Navy, flight simulators for the Air Force and NASA and strong software training. It is a direct plug-in."

William H. Howard Jr. thought the same thing when he took over as county economic development director six months ago. A former banking executive, Mr. Howard is good friends with John Moore, chief financial officer at ManTech.

ManTech "is a small version of Westinghouse," Mr. Howard said. "They were looking to add a commercial line. I had visited ManTech and told John they were a duplicate of the S3 facility."

The potential merger was "a pleasant surprise," Mr. Cromwell said. S3 Technologies "is a technological powerhouse of a resource. We expect to invest, to accelerate what we have into new market places."

S3 Technologies is a world leader in nuclear power plant simulation. More than half of U.S. simulators were made by S3. The company has also captured 61 percent of the overseas market.

Concerns about the balance of trade and the safety of nuclear power plants abroad make the international market place "a real growth opportunity" for S3 Technologies and ManTech, Mr. Cromwell said. "The future is excellent on a number of fronts."

Mr. Cromwell said it would be premature to comment on what S3 will look like after the merger until Bill Kuhlmann, the new manager, takes command.

"Employees have been living under a cloud for four years, making it very hard for them," Mr. Cromwell said. "Customers were very concerned about vendor stability and frankly, it caused S3 to lose some good people."

Workers at the Columbia office learned about the merger last week.

"We're all very positive about the move," said Richard Libra. "We've been in Chapter 11 for a long time."

"It's a positive direction," said Dr. Abdollah Abtahi. "We're looking forward to becoming part of the ManTech family. Overall, it's very uplifting to become part of a larger company."

Short term, the merger will mean keeping 300 jobs in Howard County, Mr. Howard said. "Long term, it underscores the county's commitment to high tech and hopefully a move of a company headquarters here."

The merger is also a boon from a policy standpoint, he said. "[County Executive Charles I. Ecker] says we not only want to bring people to Howard County, but once here we don't forget about them. We certainly haven't forgotten about a marquee name like S3, and we won't forget about others either, regardless of size."

ManTech employs 3,000 people worldwide and did about $200 million worth of business last year. The company has about 700 employees in Maryland — 250 in Howard County — and did about $50 million in business in the state last year, Mr. Cromwell said.

Computer simulation firms announce merger

By Michael Dresser
Sun Staff Writer

Three Columbia-based companies and a Swedish firm are joining forces to create an international computer simulation company based in Columbia.

Simulation, Systems and Services Technologies Co., known as S3, agreed Friday to merge with EuroSim AB of Sweden and two Columbia-based units of National Patent Development Corp. to form a new company to be known as Global Simulation and Engineering Systems Inc. (GSE).

The new company, which will be housed in S3's Columbia headquarters, will be headed by S3 Chief Executive William E. Kuhlmann, a former General Physics Corp. president. Mr. Kuhlmann said yesterday that the merging companies now account for annual sales of about $55 million.

"We hope to do a public financing in the fall of this year, probably at the earliest," he said. The merger would help the companies make the transition from a hardware orientation to an emphasis on software, he said.

The existing companies are active in the creation of computer simulations of power generation operations, both for nuclear and fossil fuel plants, and chemical processing. The simulations are used both for training and the development of new procedures in those industries.

The merger of the three companies is not expected to result in any significant job losses, said S3 Vice President Michael Allocco.

S3's Columbia operation will continue to employ about 275 workers, and they will be joined by an estimated 50 to 60 workers from General Physics International Simulation and Engineering Inc. and GPC Simulation Services Division. For the short term, he said, the merging companies will be operated with their current management structure intact.

General Physics International is owned by General Physics Corp. of Columbia, which is itself owned by National Patent Development Corp. of New York. GPC Simulation Services is a General Physics spinoff that is now directly owned by National Patent, which will control three of the seven board seats in GSE.

ManTech International Corp. of Fairfax, Va., which owns S3, will control another three seats, while the Swedish firm will control one.

In April 1990 Link-Miles Simulation Corporation of Columbia signed a contract to provide nuclear plant simulators to SYPRO of Sweden and Pennsylvania Power & Light Co. Link-Miles also won a contract for an ethylene plant simulator.

In August 1990 Link-Miles Simulation Corporation of Columbia, MD, a manufacturer of nuclear power-plant control room simulators, was renamed S3 Technologies. Before that it was Industrial Simulation Corporation, and even earlier, the Link Simulation Systems Division of Singer. In September 1993 ManTech International bought S3 Technologies.

Karnack Services Conducted For Thomas J. Taylor

MARSHALL, Tex.—Services were conducted at 4 p.m. Sunday at Karnack Methodist Church in Karnack for Thomas Jefferson Taylor, 86, father of Mrs. Lyndon B. Johnson, wife of the Democratic vice presidential nominee, who died in Memorial Hospital in Marshall about 3:15 p.m. Saturday.

Burial was in Algoma cemetery in Marshall. Officiating ministers were the Rev. R. E. Bischoff, pastor and the Rev. Billy Bonner, a former pastor.

Mr. Taylor was born in Alabama Aug. 29, 1874, and came to Karnack in 1899 when he was 25 years old. He opened a general store and erected a sign "Dealer in Everything" which identified the establishment as serving the entire area. He invested continuously in Harrison County land to become one of the largest landowners in East Texas.

His store is just outside the Longhorn Ordnance Works reservation, most of the Longhorn site having been acquired from him.

He also "dealt in everything," lending financial assistance to numerous individuals which from time to time had him in contracting, automobile, sawmill, fishing and other businesses.

Mr. Taylor was a lifelong member of the Methodist Church and had been a member of the Karnack Church for 60 years. He also was a continuous benefactor and erected the Sunday School building, which is known as Taylor Hall. He also presented the church with its organ.

Taylor had suffered a heart ailment for the past 15 months and had been in the Marshall hospital most of that time.

Besides Mrs. Johnson, Mr. Taylor is survived by his wife and a son, Antonio J. Taylor, of Santa Fe, N.M.; a sister, Mrs. Ida McKay; three half-sisters, Mrs. J. D. Jones Sr., Mrs. Harris Cory and Mrs. R. M. Prather, and a half-brother, Cecil Bishop, all of Prattville, Ala. Another son, T. J. Taylor Jr., died last summer.

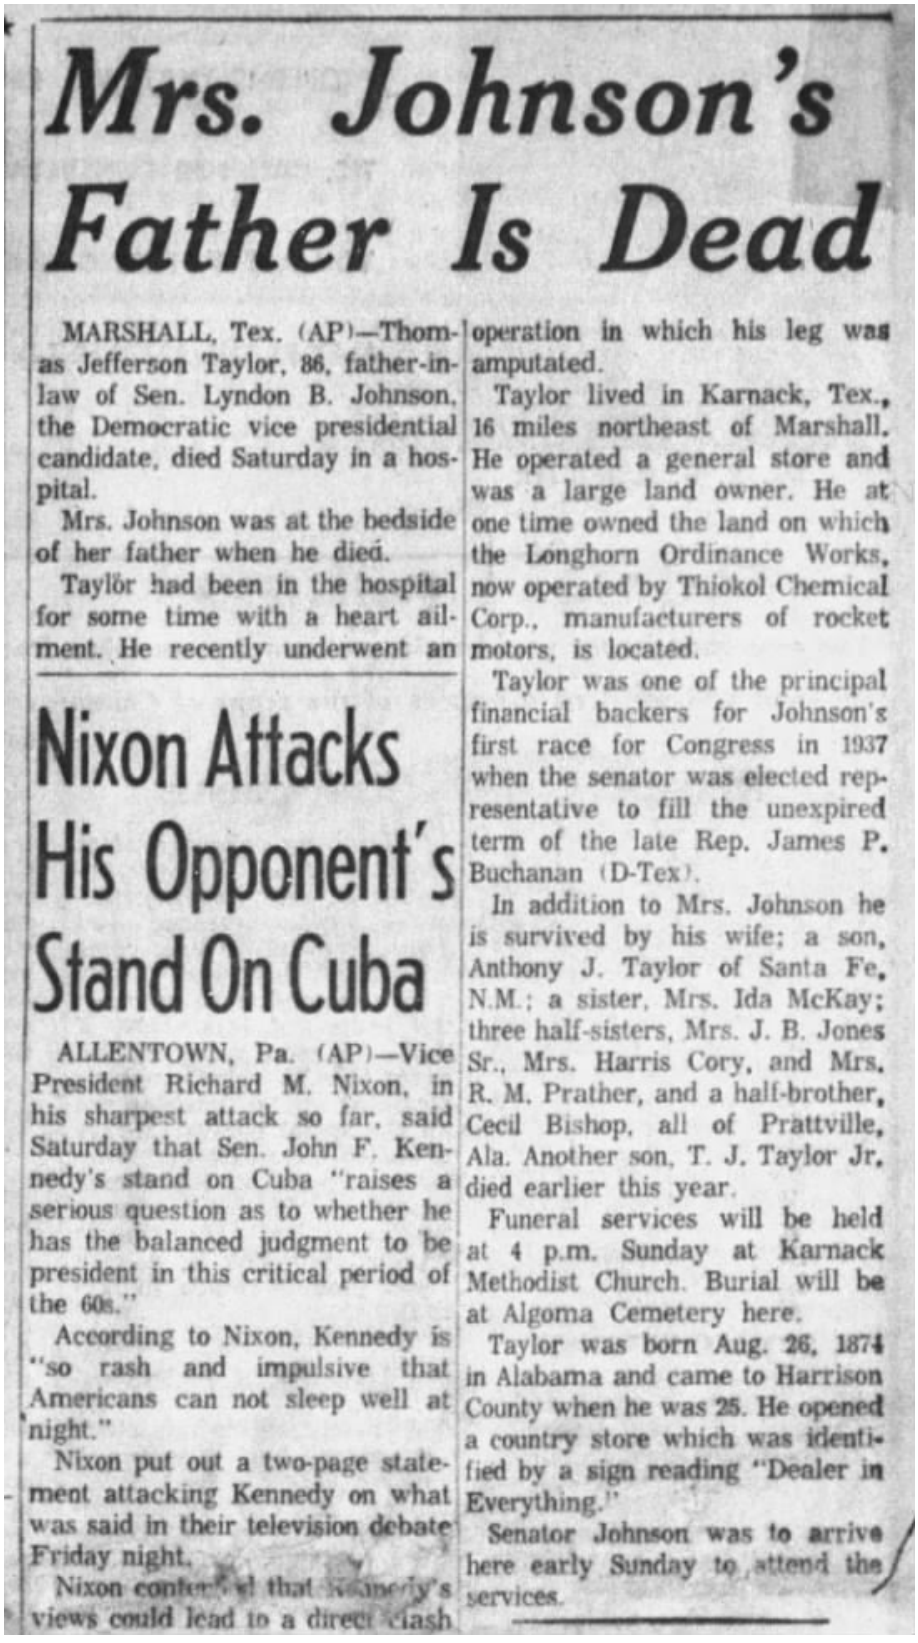
[HN00TG][GDrive]



Mrs. Johnson's Father Is Dead

MARSHALL, Tex. (AP)—Thomas Jefferson Taylor, 86, father-in-law of Sen. Lyndon B. Johnson, the Democratic vice presidential candidate, died Saturday in a hospital.

Mrs. Johnson was at the bedside of her father when he died.

Taylor had been in the hospital for some time with a heart ailment. He recently underwent an operation in which his leg was amputated.

Taylor lived in Karnack, Tex., 16 miles northeast of Marshall. He operated a general store and was a large land owner. He at one time owned the land on which the Longhorn Ordinance Works, now operated by Thiokol Chemical Corp., manufacturers of rocket motors, is located.

Taylor was one of the principal financial backers for Johnson's first race for Congress in 1937 when the senator was elected representative to fill the unexpired term of the late Rep. James P. Buchanan (D-Tex).

In addition to Mrs. Johnson he is survived by his wife; a son, Anthony J. Taylor of Santa Fe, N.M.; a sister, Mrs. Ida McKay; three half-sisters, Mrs. J. B. Jones Sr., Mrs. Harris Cory, and Mrs. R. M. Prather, and a half-brother, Cecil Bishop, all of Prattville, Ala. Another son, T. J. Taylor Jr., died earlier this year.

Funeral services will be held at 4 p.m. Sunday at Karnack Methodist Church. Burial will be at Algoma Cemetery here.

Taylor was born Aug. 26, 1874 in Alabama and came to Harrison County when he was 25. He opened a country store which was identified by a sign reading "Dealer in Everything."

Senator Johnson was to arrive here early Sunday to attend the services.

Nixon Attacks His Opponent's Stand On Cuba

ALLENTOWN, Pa. (AP)—Vice President Richard M. Nixon, in his sharpest attack so far, said Saturday that Sen. John F. Kennedy's stand on Cuba "raises a serious question as to whether he has the balanced judgment to be president in this critical period of the 60s."

According to Nixon, Kennedy is "so rash and impulsive that Americans can not sleep well at night."

Nixon put out a two-page statement attacking Kennedy on what was said in their television debate Friday night.

Nixon contended that Kennedy's views could lead to a direct clash

MAX SIMS LALE AND LONGHORN ARMY AMMUNITION PLANT

3-2007

Max Sims Lale and Longhorn Army Ammunition

Gail K. Beil

Max S. Lale

By Gail K Beil and Max S. Lale

In 1946 Max Lale reluctantly left the U.S. Army. He would have preferred to make a career of the military, he once said, but his wife Georgiana, an only child from Denison, Texas, was dead set against it and felt the need to be closer to her parents. Max, who constantly struggled to win the approval of Georglana's

socialite mother. decided the better part of valor was to put the uniform in the closet and take up his first career, journalism.

Born in Oklahoma on August 31, 1916, Max graduated from the journalism school at the University of Oklahoma before serving in the military and joined the *Marshall News Messenger* as a reporter in 1946. While there he met his mistress, Texas history, particularly the history of Harrison County. That love affair survived Georgiana and lasted throughout his life. His last bit of research committed to publication - in this case in the **April 29, 2006**, edition of the News Messenger - was completed five days before his death. The only difference between it and all the other pieces written over the years for a number of historical journals. newspapers, and books was that its genesis was not in the clacking keys of an old Royal typewriter. Max wrote it on a legal pad. his beloved second wife, Cissy, transcribed it on her brand new computer. and I added it as a sidebar to a feature I had written on Marshall's Temple Moses Montefiore's unique tracker organ.

Max acquired his love for history as a byproduct of his journalism career. One of his first assignments from News Messenger publisher Millard Cope was to write a comprehensive history of Marshall and Harrison County. The piece was to he some thirty-two pages in length and include everything from agriculture to **weapons of mass destruction**. Unfortunately, after it had been set in linotype and was ready for production about half of the article was dumped or spilled or otherwise destroyed. There were apparently no other copies, so half of what reporter Lale wrote never saw print. This vexed him so much that he spent the next sixty years trying to recapture the lost stories. Along the way he contributed to numerous historical journals, wrote nineteen Texas Historical Marker applications, at least six nominations for the National Register. and too many book reviews to count. He also produced a book-length account of the Sims and Lale families in Shawnee and his well-received autobiography, Max's Memoirs.

Max left Marshall briefly late in the 1950s for Greenville, Texas and a stint as publisher of the Greenville Herald. He soon returned and on August 1, 1961, took a position as public information officer for **Thiokol Chemical Company,** contractor at the **Longhorn Army Ammunition Plant (LAAP).** Longhorn occupied more than 8,000 acres on the eastern shore of Caddo Lakc near Marshall - a body of water that usually has the adjective "mysterious" attached to it, divides itself between Texas and Louisiana, and is considered Texas' only naturally formed lake.

Immediately Max began anew researching and writing local history. He started collecting and publishing not only Longhorn's colorful history but also that of **Harrison County's first ammunition plant, the Powder Mill, built in 1861 to serve the Trans-Mississippi Department of the Confederate States of America**. When LAAP finally became eligible for official historical recognition in 1999, Max and I vowed we would collaborate on an application for its Texas Historical Marker. Other projects tore us away and we never did. So in honor and memory of Max Sims Lale, and based almost entirely on his research, here is the history of LAAP from 1941 to 1997. May it become Max's twentieth, and my thirteenth, successful historical marker application.

Longhorn Army Ammunition Plant

Shortly before Japanese forces attacked Pearl Harbor on December 7, 1941 , as war looked inevitable and plans for the manufacture of material and weapons to fight it leapt from old soldier's dreams to the drawing boards of the War Department, **Monsanto Chemical Company** was approached by the U.S. Army's Ordnance Department to consider the operation of a smokeless powder plant. Monsanto was willing to take on the charge, but the St. Louis-based firm answered that it would be better suited for the manufacture of TNT, "an explosive described as 'looking like maple sugar when cold and maple syrup when melted.'" From the beginning of operations at what was first called the **Longhorn Ordinance Works** there were two employers; the contractor, who employed the majority of the workers, and the Army, owner of the land and facility and in charge of all operations. The Army generally stationed a colonel, one or two other officers, and three dozen or more civilians at the armament works. [1]

The new installation was a six-line special TNT plant designed by E.I. DuPont de Nemours C. Inc. and the location for the plant was announced on December 15, 1941. The site chosen consisted of 8,493 acres in the unincorporated village of Karnack in Harrison County, on the banks of Caddo Lake. At the time Lyndon Baines Johnson was a U.S. Representative from Texas and a favorite of President Franklin Delano Roosevelt. Johnson's wealthy, influential father-in-law, Thomas Jefferson "Cap" Taylor, whose home was located less than three miles from Caddo Lake, happened to own a great deal of the land involved and assisted in the purchase of much of the rest. Taylor's general store, "TJ. Taylor - Dealer in Everything," on U.S. 43 was a prominent landmark in Karnack. and he had made a name for himself as a political powerhouse by snaring the second state park established in Texas, Caddo Lake State Park, which consisted of 478 acres on the Cypress Bayou where it empties into the lake, [2]

Production at Longhorn began on October 6, 1942, with the first flake of TNT produced at 12:20 p.m., October 19. At its height in the 1940s, the plant had 1,518 employees, many of whom were imported from St. Louis by Monsanto. The influx caused a housing shortage in Marshall and permission was granted to construct a large housing addition, dubbed "Yankee Stadium," normally impossible in the wartime economy, on the south edge of town. Loyal and patriotic, Longhorn workers "staunchly backed the War Bond program, 99 percent signing up for payroll deduction purchases averaging 10 percent of their salaries." **Longhorn had produced 414,805,500 pounds of TNT when production ceased on August 15, 1945**. By then it had reduced the price from the original cost of seventeen cents per pound to approximately six and a quarter cents per pound, quite a reduction from the nearly fifty cents per pound the explosive had cost during World War I. [3]

On April 23, 1946, the plant became what the Army called "a standby installation," with Monsanto maintaining a small workforce until June 16, 1946, when the government assumed control of the facility. At that point, the staff consisted of two Army officers and thirty-two civilians. It soon increased to three officers and eighty-five civilians when it became apparent that Monsanto had failed to clean up the plant adequately before being relieved of responsibility. [4]

From November 1945 to June 1950, Longhorn remained in mothballs, with the labor force fluctuating between 85 and 210 - all employed by the U.S. Army - depending on the workload required to maintain the facility and keep the plant in operating order. In February 1952 it was needed again, and this time Universal Match, also based in St. Louis, was the general contractor with instructions to manufacture a propellant fuel that would be loaded, assembled, and packaged as pyrotechnic ammunition for use in Korea. Universal Match's general manager arrived in Marshall on December 7, 1951 to begin operations. On July 27,1953 an armistice between the U.S., Korea, and China was signed, and on March 14, 1956 Universal Match's contract was cancelled. A month later the production of all pyrotechnic ammunition items ceased and Plant One was again relegated to standby status. [5]

Longhorn was divided into three production units, each with a unique manufacturing capability. Plant One had opened with the arrival of Monsanto and produced TNT. Monsanto also opened Plant Two to meet the need for pyrotechnics - flares and illuminating bombs. **By 1956 plants one and two were idle but work had begun on a new plant, one that would be used by Thiokol Chemical Corporation to produce an altogether new product - solid fuel rocket motors.** Longhorn was selected as the site to do the work following an engineering study by the chemical giant, which already had two contracts to operate facilities at Redstone Arsenal in Huntsville, Alabama. **Whether Lyndon Johnson's position on the Senate Armed Services Committee had anything to do with the ultimate decision to make rocket motors on the banks of rural Caddo Lake remains speculation**. [6]

Plant Three cost $10 million, an expenditure that included roads, railroad tracks, and eventually fresh water treatment and wastewater treatment

installations. The highly guarded, intensely classified area was, for the most part, completely self-sufficient. **Ray McElvogue** was named Thiokol's general manager on October 2, 1952, and remained in that position until well into the 1970s. Plant Three grew in a series of five expansions, each built by Brown and Root Construction and costing $11,503,411 by the time all were completed in 1962. Driven by the Cold War, the escalating problems in the Far East, and a growing number of American troops committed to Vietnam by 1964, the need for intermediate-range, nuclear-tipped rockets escalated. **Even though Longhorn had no role in the manufacture of nuclear weapons its employees, who numbered nearly 3,000 in those days, provided the muscular means of delivery.** For that effort Longhorn had been funded with more than $141 million in 1964. Additionally, Plant Two was reopened to manufacture button bombs, illuminating flares, and other pyrotechnics needed in increasing numbers in Vietnam. A portion of those construction dollars financed the construction of three huge powder magazines in a remote area away from where TNT and solid fuel were produced. [7]

Dynamics other than war and threats of war began playing a part in the growth of the plant, particularly in the recruitment of employees as the need for them grew from the dozen Thiokol brought to Karnack in 1952 to the 2,663 who suited up in white in 1968 to run the production lines. What had been a white man's world as far as skilled and semi-skilled workers were concerned in 1941 now included women and minorities. Employment efforts extended from advertisements in scientific journals to recruitment forays into the Job Corps and the Neighborhood Youth Corps - both programs of Johnson's "Great Society." [8[

All blessings come with consequences and so it was with the influx of new employees, most of whom chose to reside eleven miles away in Marshall. The roads between the plant and the town were narrow and winding and poorly graded. The almost right-angle curves, un-maintained road shoulders, and daily traffic jams as nearly 2,000 automobiles entered and left the plant at the same time twice a day, where they often met the ten buses serving Karnack ISD students, led to much frustration and too many accidents. Moreover, despite the fact that the City of Marshall had issued permits in 1967 for 114 residences plus a few apartments, and another 224 were issued the next year, there was a critical shortage of housing, especially rentals for the more transient Army's officers and civilian personnel, who numbered about 300 of the more than 2,900 employees. By 1968, Colonel Royce P. Larned, who was commanding officer and in charge of the plant itself, and Ray McElvogue decided it was time to take matters into their own hands. [9]

They met with the Texas Highway Department's resident engineer, Harrison County Judge, and Precinct Two County Commissioner. The county was responsible for the purchase of highway right-of-way, which had grown increasingly expensive after World War II. Since all the roads involved were state property the state would have been responsible for actually building or improving them, Before the meeting Colonel Lamed had ordered a study of the traffic problems and road conditions on the highways and farm-to-market roads that employees traveled daily. The study was conducted by the state highway department and resulted in a book-length report. On December 27, 1968, it was presented to the local officials. In addition the Access Road Study went up the chain of command to the D. S Army Munitions Command as well as to state and federal officials. It apparently failed to make an impression. Resident Engineer Gilbert A. Youngs said that while improvements to the forty miles of access road into the LAAP installation were on the drawing boards, "No funds are provided for it~ reconstruction at this time and other priorities in the county prevent our contemplating its reconstruction within the next five or six years." [10]

This response was utterly unsatisfactory to Larned and McElvoguc who decided to counter it with an aggressive public relations campaign to educate the public about the economic and strategic importance of LAAP to the community. McElvogue conducted off-the-record, one-on-one meetings with community leaders and spoke to local civic groups, beginning with the Marshall Rotarians. He served as president of the Greater Marshall Chamber of Commerce in 1968, and he and Max Lale continued to he members of the board of directors for a number of years. News conferences with Vietnam veterans and foreign visitors appeared not only in the local media but also an in-house publication. the Longhorn Missile, for which Lale was responsible. **Both Lale and McElvogue were also members of a semi-secret organization consisting exclusively of white males; bankers, major retailers, the News Messenger publisher, and heads of a couple of other Harrison County manufacturing plants. The group called itself "The Citizens Advisory Board," but members were known locally as "The Do Gooders."** Among the organization's functions was to choose and fund candidates for city and county offices.

When the state refused to improve the roads between Marshall and LAAP Lale, ever the practical historian, decided to take a page from the history of Marshall city government. In decades past, when the economic engine of the town had been the Texas and Pacific Railroad, the T & P was always represented by one member of the five-man city council. Lale concluded that LAAP should enjoy the same privilege and decided to run for a seat, a decision apparently endorsed by both McElvogue and the Do Gooders. He was elected to a two-year term in April 1963, running unopposed and drawing 1,970 votes out of a total of 2,023 cast (the others were write-ins). After one two-year term he retired, at the request, he said, of his boss. For his service in this unpaid position he was presented with a box of cigars. By 1967, McElvogue himself saw the merit in having an official seat at the table and ran in 1967 against rancher Carl Swendson, whom he defeated, 678 to 456. His success was undoubtedly aided by a non-partisan "Democracy in Action" program at the plant designed to encourage employees to register to vote and to support their candidates with their funds and their efforts.

In October 1968 Thiokol executives and Army leadership decided to show off the LAAP facilities to the public and scheduled an open house at the site. More than 6,000 invitations were sent to employee families. Marshall and Harrison County opinion leaders, and area dignitaries. Lale, who had circulated a full year's printing of the Longhorn Missile (1968) to opinion makers, school and college personnel, banking institutions, and key business firms in the area, created a program that included paintings by well-known local artist Max Cole and the history of both Longhorn Army Ammunition and the Confederate-era Marshall Powder Mill. The open house, a..o;; well as a celebration on December 30, 1968, for LAAP's production of the IO-millionth round of artillery and mortar illuminating ammunition drew extended coverage from ABC and CBS affiliates in Shreveport and Tyler. Marshall Radio Station KMHT (for which Lale had once been the newscaster in addition to his duties as a News Messenger reporter) and Marshall and Longview newspapers also covered both events extensively. The year of frenetic activity led to many awards earned by the plant from manufacturing and defense-related entities. Each presentation ceremony was well covered by both the in-house and general publications. [11]

Although the roads continued to be a headache, in other areas conditions improved. [12]

The increasing volume of criticism over U.S. involvement in the Vietnam War reached Marshall only peripherally. No local protests were held against a government-owned plant manufacturing ammunition for an unpopular war. Indeed, concern was exactly the opposite. Local residents worried that troop withdrawals from Vietnam, Congressional debate over the further proliferation of anti-ballistic missiles, and high-profile anti-war demonstrations across the nation would have a deleterious effect on the economic status of Marshall and Harrison County. Their concern was palpable enough that McElvogue tried to reassure his employees and the community at large in a letter he called "Smoke Signals."

- I am sure you have been hearing and reading a lot of references to and criticism of 'the military-industrial complex' in our country and may be concerned that the criticism, at least by reference, is against us in the Longhorn Division....Here at Longhorn we are performing a absolutely vital task in supporting American fighting men who, without our production, would be severely handicapped in a particularly difficult war. We more than most can appreciate the anguish of our men in Vietnam. We more than most do pray for a honorable end to the war. There is no "conspiracy" about our activities. We are not

plotting to rob the taxpayers. We are not trying to take over the country.

- Don't be bugged. We are doing important work. We are doing it with high quality, on time and at a very reasonable cost. Whatever else may be said, we have the satisfaction of knowing our friends and relatives in Vietnam recognize and respect the work we are doing. [13]

While there were no local demonstrations against the war or the plant, the fears of MeElvogue and others did come to pass. By 1973 a cease-fire in Vietnam was declared, and in 1975 the ignoble evacuation of Saigon was complete and no U.S. troops were left in South Vietnam. From a high in November 1968 of 2,986 workers and officers, LAAP employment rolls numbered fewer than 1,000 by 1975. Max Lale, who had suffered a heart attack and subsequent open-heart surgery at age 59, retired from Thiokol on October 23, 1975. There were no more comprehensive installation histories prepared under his careful hand. [14]

Longhorn again had its place in the sun in 1988 when national leaders decided to eliminate the Pershing Missiles once manufactured there. On December 8, 1987, U.S. President Ronald Reagan and USSR General Secretary Mikhail Gorbachev signed the Treaty of Intermediate Nuclear Forces, in which the United States and the Soviet Union consented to eliminate an entire class of nuclear missiles. The U.S. agreed to destroy the entire class of medium-range Pershing I and Pershing II weapons and the USSR an equivalent class of SS 20 Sabers. The Soviet-manufactured Saber motors were done away with at Kapustin Yar Missile Test Complex in the USSR at the same time that the majority of Pershing motors were static-fired, then crushed, at Longhorn. [15]

On September 8, 1988, a U.S. delegation led by Vice President George H.W. Bush and a Soviet entourage led by Chief Inspector Nikolai Shabalin, along with representatives from several NATO countries and local, state, and federal dignitaries, watched as Thiokol engineers fired the first Pershing I motor, bound into the harness at the static testing site, and it burned itself out. It was then rolled from the platform and beaten into small bits by the bucket of a bulldozer. Pieces of the spent and blackened casing were presented to many of those in attendance. The routine was repeated with a Pershing II rocket motor. They were the first two of 700 Pershing I and II rocket engines eventually static-fired at Longhorn. Covering this first destruction on American soil of a ground-launched cruise missile, as specified in the INF Treaty, were representatives from more than one hundred foreign and domestic media outlets. But the dignitaries and the press were not the only observers. High on a utility wire above the site perched two or three dozen bluebirds. When the engine roared to life the little birds vanished, but as quiet once more returned to the shores of the lake and the tall pines surrounding the ceremonial grounds, so did the flock of bluebirds, which returned to the wire. The missiles and manufacturing activities are all gone now. The bluebirds remain, harbingers of Longhorn's future. [16]

Following the official ceremonies, the work of carrying out the treaty began in earnest. Every six weeks until May 1991, a team of Soviet scientists, military officers, and KGB agents arrived in Marshall, occupied a special "secure" wing of the Ramada Inn hotel, and remained for a month. When their job of witnessing the elimination of the missiles ended each day they were free to do almost anything they wished or go anywhere in the county except into private homes. Trips to Wal-Mart and automobile showrooms were a favorite, and many also accompanied their official escort, Colonel Jim Kealey, fo St. Joseph's Catholic Church in downtown Marshall. Visits to schools and colleges provided a particularly enjoyable experience for both students and Soviets. When the Marshall High School Mavericks won the state UIL football playoffs in 1990 many members of the inspection teams attended home games. Tongue in cheek, they claimed credit for bringing luck to the Mavericks with their presence. When acclaimed journalist and Marshall native Bill Moyers updated and reissued his Emmy Award-winning documentary, "Marshall, Texas/Marshall, Texas." in 1992, he included a segment showing one of the Soviet Inspection Teams playing tag football with some of the Mavericks. "M.T. / M.T." opens with scenes from "Max Lale Day" when the town honored its official historian with festivities on the town square. [17]

In 1990, Longhorn was listed as one of the Department of Defense facilities with known contaminants in the soil, surface, and ground water sufficiently toxic to be named to a list of federal Superfund Sites. Under the supervision of what is now known as the Texas Commission on Environmental Quality and the federal Environmental Protection Agency, five separate locations within the plant were to be restored using funds allotted by the DOD. Per chlorate, heavy metals and other armament-related debris, petroleum, and lubricants were identified in one or all. Work to clean up Longhorn began soon afterward. [18]

Its personnel already reduced to a skeleton crew of Morton-Thiokol and Army civilian workers, Longhorn fell victim to the "peace dividend" after the Cold War ended. On June 27, 1995, officials of the U.S. Army, with Congressman Jim Chapman as a guest, held inactivation ceremonies, although cleanup work continued under the direction of the environmental protection agencies. The Army had the option of retaining the land or offering it to any other federal agency, with top priority going to the Department of the Interior, which quickly snapped it up. About 900 acres of the most-pristine land and the two-remaining cinder block-constructed facilities was leased to the private, non-profit Caddo Lake Institute in 1997. **The remaining land apart from the cleanup sites was transferred to the U.S. Fish and Wildlife Service, and as each of the Superfund areas is pronounced safe it is added to the Caddo Lake National Wildlife Area**. Public access is expected to begin in September 2006. [19]

Most of the termite-ridden and contaminated buildings are gone. The three powder magazines still stand as lonely sentries on a narrow road at the south end of the old plant. When the U.S. Fish and Wildlife Service took over, Williams decided to "open their doors and see what came in." What came in were several varieties of bats, and Williams and other nature enthusiasts and tourism-promotion officials envision an attraction equal to the Congress Avenue Bridge in Austin and the Waugh Drive span in Houston, where hundreds of people gather at twilight to watch the bats' departure. [20]

Max often mused that when he joined the Army ROTC at the University of Oklahoma in the 1930s, it was equipped with horse-drawn, French-made seventy-millimeter guns. He lived to see the Army field artillery equipped with medium range missiles whose motors were manufactured at Longhorn, where he spent the last fourteen years of his working life. And he fully approved of the decision to make Longhorn a wildlife preserve.

NOTES

'Proposal to Monsanto made in Ih~ sIlmm~r of L941. Much of the material for thi~ account,

including the I\uotation in this paragraph, is taken [rom a well documenled, four-vulume hislury

of Longhorn researched and prepared by Max Lale, a complete set of which can be found in the

archives of the Harrison County Historical Museum Library (hereafter referred to as Installation

History). According to Lale, information rdating to the beginning of the plant he drew from a I>pecial

section devoted to LAAP published in the Marshall News Messenger, November 4, 1945.

Ruptured heart kills city businessman Antonio J. Taylor

By The New Mexican Staff

Memorial services will be conducted Thursday, Sept. 4, at 11 a.m. at St. John's United Methodist Church for prominent Santa Fe businessman Antonio J. Taylor who died at St. Vincent Hospital Sunday.

TAYLOR

Taylor, 82, died of a ruptured aorta.

In 1927, Taylor opened the Old Mexico Shop at Galisteo, which deals in imported arts and crafts, at Galisteo and Water Streets.

Born in 1904 in Karnack, Texas, Taylor came to New Mexico in 1918 as one of the first students of the Los Alamos Ranch for Boys.

Fluent in Spanish, Taylor had a lifelong love affair with Mexico and became one of the first people in the United States to import huge volumes of Mexican arts and crafts.

Fellow importer Lou Slavitz of New York City said Taylor would scour the Mexican countryside looking for top quality crafts and art. He would advance craftsmen part of the cost of materials and have them discount their wholesale price when they delivered their consignments of goods.

His support and encouragement in developing Mexican arts and crafts for export won him widespread respect and recognition on both sides of the border.

Taylor was one of the first people to use mail order to market his collections of imported merchandise.

In 1940, Taylor was president of the Santa Fe Fiesta Council. In 1968, he served as an informal translator for discussions between then U.S. President Lyndon Johnson and Mexican President Luis Dias Ordaz which lead to the Chamizal Agreement between the two countries.

Johnson was married to Taylor's sister Lady Bird Johnson. The former first lady was a frequent visitor to Santa Fe.

In 1976, Taylor received the rank of Commander of the Order of Isabel La Catolica bestowed by King Juan Carlos of Spain in recognition for his service as vice counsel of Spain in the U.S. southwest.

Taylor was a distinctive figure in Santa Fe, known for his wit, charm and kindness. At Christmas, the Old Mexico Shop would invite the children from the now closed St. Vincent Orphanage to pick out new shoes.

Survivors include his wife Matianna Vigil Taylor; two daughters, Mrs. Jack Hopkins of Santa Fe and Mrs. Diana McArthur of Washington, D.C. and a sister, Mrs. Lyndon B. Johnson of Austin, Texas. Other survivors include four grandchildren, and two great grandchildren.

Taylor will be buried at a private ceremony at Rosario Cemetery. The family requests that in lieu of flowers, memorial contributions be made to the Salvation Army, where Taylor served on the board of directors.

Mrs. Johnson's Father Is Dead

MARSHALL, Tex. (AP)—Thomas Jefferson Taylor, 86, father-in-law of Sen. Lyndon B. Johnson, the Democratic vice presidential candidate, died Saturday in a hospital.

Mrs. Johnson was at the bedside of her father when he died.

Taylor had been in the hospital for some time with a heart ailment. He recently underwent an operation in which his leg was amputated.

Taylor lived in Karnack, Tex., 16 miles northeast of Marshall. He operated a general store and was a large land owner. He at one time owned the land on which the Longhorn Ordinance Works, now operated by Thiokol Chemical Corp., manufacturers of rocket motors, is located.

Taylor was one of the principal financial backers for Johnson's first race for Congress in 1937 when the senator was elected representative to fill the unexpired term of the late Rep. James P. Buchanan (D-Tex).

In addition to Mrs. Johnson he is survived by his wife; a son, Anthony J. Taylor of Santa Fe, N.M.; a sister, Mrs. Ida McKay; three half-sisters, Mrs. J. B. Jones Sr., Mrs. Harris Cory, and Mrs. R. M. Prather, and a half-brother, Cecil Bishop, all of Prattville, Ala. Another son, T. J. Taylor Jr., died earlier this year.

Funeral services will be held at 4 p.m. Sunday at Karnack Methodist Church. Burial will be at Algoma Cemetery here.

Taylor was born Aug. 26, 1874 in Alabama and came to Harrison County when he was 25. He opened a country store which was identified by a sign reading "Dealer in Everything."

Senator Johnson was to arrive here early Sunday to attend the services.

Nixon Attacks His Opponent's Stand On Cuba

ALLENTOWN, Pa. (AP)—Vice President Richard M. Nixon, in his sharpest attack so far, said Saturday that Sen. John F. Kennedy's stand on Cuba "raises a serious question as to whether he has the balanced judgment to be president in this critical period of the 60s."

According to Nixon, Kennedy is "so rash and impulsive that Americans can not sleep well at night."

Nixon put out a two-page statement attacking Kennedy on what was said in their television debate Friday night.

Nixon contended that Kennedy's views could lead to a direct clash

1990 Book - "The Army's Nuclear Power Program : Evolution of a Support Agency"

See book : [HB000C][GDrive]

Acknowledgements:

"While I received many suggestions and much constructive criticism of the manuscript during and after the writing, I felt that the new version needed one more reading. As a result, I turned to two of the people who had provided me with information and then read the completed book. ***William B. Taylor*** *worked within the Army's nuclear power program almost from its inception and in later years served as a consultant to the nuclear power program. He read the manuscript with considerable care from the perspective of a person who had been there and simply wanted to insure accuracy of the story."*

Chapter 1 - The Beginnings

Pages 7 to 17

[...]

In the approved Memorandum, dated July 22, 1952, Collins assured Secretary Pace that he "strongly" concurred that the Army should have a "dynamic program"in the area of nuclear energy. To accomplish this, the Chief of Staff proposed that the Army immediately enter into a contract with a qualified research group to begin work on a program that would produce a mobile or semi-mobile atomic power source within a four- to eight-year period. The Memo acknowledged that the cost of producing power from the first nuclear plant would probably exceed that from a conventional power source. Consequently, the Army would have to justify its expenditure of funds on the basis of logistic savings in transporting fuel to remote areas. Secondarily, the service would have to justify the program as providing an impetus for the development of the commercial nuclear power industry and so offer great potential value to the nation as well as having "a major indirect military benefit."20

The Memorandum went on to explain that the research contract would not only be feasible, "but very timely in light of the progress made to date in reactor development and in light of the studies that are being made by the power industry."

To initially finance the Army's Nuclear Power program, Collins proposed that the Army provide approximately $250,000 to the Chief of Engineers to administer the contract. During the 1953 fiscal year, Collins said that the Chief of Research and Development would need an additional $1 million to continue the Program, to be obtained either by reallocation of his budget or by appealing to the Secretary of Defense's emergency fund. According to the Memo, Dr. Hafstad agreed that the Corps of Engineers should initiate the project. Once it had developed a firm military requirement and defined a specific reactor project, the Army would consult with the AEC "to determine the best way for proceeding with the engineering and construction phase."21

Collins explained that the initial contract would be expected to accomplish three goals. It would determine the nature of the Army's requirements for power sources to be provided by power plants. It would ascertain the most effective type of reactors to meet those requirements and provide a preliminary design analysis to show the scope of the effort required. Finally, it would arrive at a proposed program that would include a probable time schedule, estimated cost, and organizational structure recommended to carry out the project.

The Chief of Staff singled out the immediate need to assign an officer to the project who could carry it forward with "dedicated vigor, determination and continuity." He reported that the Chief of Engineers had agreed to assign an officer to the program for as long as needed. Collins said he was prepared to approve and he urged Pace to recognize that "the officer selected for this position shall be permitted to remain with it so long as assignment appears desirable." On the other hand, decisions regarding size of the support staff and whether it should include in the area of nuclear energy. To accomplish this, the Chief of Staff proposed that the Army immediately enter into a contract with a qualified research group to begin work on a program that would produce a mobile or semi-mobile atomic power source within a four- to eight-year period. The Memo acknowledged that the cost of producing power from the first nuclear plant would probably exceed that from a conventional power source. Consequently, the Army would have to justify its expenditure of funds on the basis of logistic savings in transporting fuel to remote areas. Secondarily, the service would have to justify the program as providing an impetus for the development of the commercial nuclear power industry and so offer great potential value to the nation as well as having "a major indirect military benefit."20

The Memorandum went on to explain that the research contract would not only be feasible, "but very timely in light of the progress made to date in reactor development and in light of the studies that are being made by the power industry." To initially finance the Army's Nuclear Power program, Collins proposed that the Army provide approximately $250,000 to the Chief of Engineers to administer the contract. During the 1953 fiscal year, Collins said that the Chief of Research and Development would need an additional $1 million to continue the Program, to be obtained either by reallocation of his budget or by appealing to the Secretary of Defense's emergency fund. According to the Memo, Dr. Hafstad agreed that the Corps of Engineers should initiate the project. Once it had developed a firm military requirement and defined a specific reactor project, the Army would consult with the AEC "to determine the best way for proceeding with the engineering and construction phase."21

Collins explained that the initial contract would be expected to accomplish three goals. It would determine the nature of the Army's requirements for power sources to be provided by power plants. It would ascertain the most effective type of reactors to meet those requirements and provide a preliminary design analysis to show the scope of the effort required. Finally, it would arrive at a proposed program that would include a probable time schedule, estimated cost, and organizational structure recommended to carry out the project.

The Chief of Staff singled out the immediate need to assign an officer to the project who could carry it forward with "dedicated vigor, determination and continuity." He reported that the Chief of Engineers had agreed to assign an officer to the program for as long as needed. Collins said he was prepared to approve and he urged Pace to recognize that "the officer selected for this position shall be permitted to remain with it so long as assignment appears desirable." On the other hand, decisions regarding size of the support staff and whether it should include liaisons at various AEC reactor sites could be deferred until the completion of the initial contract."22

In concluding, Collins raised the issue of how the Program would be classified for security purposes. He "earnestly" proposed that the project be unclassified except for details "that must be classified in accordance with the regulations of the AEC as required by the Atomic Energy Act." Collins justified this position by voicing a theme that would run through the life of the Army's Nuclear Power Program. It offers "a fruitful source of effective publicity on Army support of peaceful application of atomic energy."23

While Collins' Memo was passing upward through the chain of command, Gen. Nichols continued to establish the groundwork for the future Nuclear Power Program.

On July 17, Dr. Dunning called to say that Columbia "would be very interested in doing the job but could undertake it only if it is to be a long-range thing." He explained that the school would have to reassign people to the contract from other work, from other institutions, and from other contracts with industry. Since Columbia had a firm policy that it would not handle any project on a subcontract basis, Dunning suggested that if the Army wanted the university to work with a private research firm, it would have to give prime contracts to both and have it cross-referenced to each.24

On July 29, 1952, Secretary Pace responded to Collins' Memo by giving the Chief of Staff's proposal his "complete approval and support." He expressed his gratification at "the specific steps proposed, or already taken, to accelerate the Army's participation and action in this most promising area of research and development." He hoped that Collins could select a contractor "at an early date" to initiate the research phase of the Program. The Secretary also gave "hearty endorsement" to the concept of selecting an officer to run the Program on a long-term basis, calling it a "most forward-looking one."25

In conclusion, Pace wrote that he agreed the Army "should strive to accomplish this program on an unclassified basis as you propose. The far-reaching benefits of this program in terms of peaceful application should be made known as fully and as rapidly as possible to the American public." He also asked to be kept "closely informed as to the progress in the vigorous execution of this program." To this end, he suggested a meeting with Collins on the subject in early October. In the meantime, he said his office would be available to provide assistance "in the furtherance" of the project.26

On August 4, responding to the Secretary's approval, the Chief of Engineers Gen. Pick, with Gen. Nichols' concurrence, selected Col. James B. Lampert to head the Army's Nuclear Program. Lampert had first become involved with atomic power in 1946, when, as a promising young engineer officer, he received an assignment to the Manhattan District as a Corps of Engineers' replacement to the wartime staff. A long tour of duty had enabled him to become familiar with atomic energy activities. Subsequent assignments as District Engineer in Charleston from 1949 to 1950, and in a civil works capacity in Tulsa at the time of his new appointment, had given him administrative experience. Arriving in Washington in the middle of August for his initial briefing, Lampert found the Program "was on an extremely tentative state."27

In their first meeting, Gen. Nichols told Lampert he hoped the Army's Nuclear Program would follow the pattern established by Rear Adm. Hyman Rickover in developing the Navy's nuclear submarine program. Rickover held a position as an Assistant Chief of the Navy's Bureau of Ships and as a head of an operating program within the Atomic Energy Commission. In addition, the then-captain operated with a Navy budget and an AEC budget to finance the nuclear submarine program. Although Lampert ultimately created a similar organization, he first had to overcome resistance within the AEC to "the idea of establishing another military program within [its] bosom."28

In the meantime, as Lampert was beginning his initial exploration of his new assignment, the Army formally designated the Corps of Engineers as the supervisory agency. By the time the Colonel had completed his move to Washington in early September, the Corps of Engineers had begun discussions with the Atomic Energy Commission on procedures for getting the program quickly underway. The AEC "recommended very strongly" that the Army follow the same procedures that the Navy and Air Force had used with their nuclear reactor programs. Like his counterparts, Col. Lampert would receive dual assignments, as head of the Army's program and a position in the Reactor Division of the AEC. This arrangement would enable him to be in immediate touch with all aspects of the Commission's reactor development program. The AEC also suggested that the Army officially express to the Agency its interest in starting a reactor program so that the AEC would have a basis for active cooperation in the Army's program.29

To accomplish the last item, Secretary Pace wrote to Gordon Dean, Chairman of the Commission, on September 10, 1952, outlining the Army's interest in developing a nuclear power capacity. According to Pace, at some point in the future the Army would have sufficient need for a power source free from conventional fuel requirements that would justify the additional cost of a nuclear power facility over a conventional power plant. The Secretary asked the Atomic Energy Commission for "advice and assistance" in selecting a contractor for the feasibility study and cooperation with the research group so that the study would benefit from the work of the AEC's Reactor Division. Pace also asked that the Commission accept Col. Lampert on a dual assignment basis in its Reactor Division."30

In his response on October 7, 1952, Dean agreed to cooperate with the Army in its study of possible military uses of nuclear energy. He pointed out that the AEC had already done studies on the economics of operating small nuclear reactors. As a result, he thought the Army should avail itself of the information on hand before extending a contract for an independent feasibility study. In fact, the AEC Chairman thought the Commission should retain responsibility for the study of any new reactor design to avoid duplication and confusion. Dean did agree that Lampert should work closely with the AEC's Division of Reactor Development in evolving any Army reactor program.31

Meanwhile, Gen. Nichols had been working with Col. Lampert to establish a viable foundation for the Army's program. On September 17, Dr. Dunning had come down from Columbia University to go over the project with them, and on September 22, they had met with Thomas Murray, one of the AEC Commissioners, to discuss the proposed program. Murray followed up the meeting on October 9, when he called Gen. Nichols to find out if Dean's letter to Secretary Pace "fit the bill." He also suggested Nichols and Lampert meet with him again to talk about the mechanism of the Army's program after Lampert had spent a week in the Commission's headquarters. In turn, on October 16, Nichols advised Pace that Dean's letter "may furnish an adequate basis for initiation of the program" even though it contained "certain reservations" the AEC had in "relinquishing any jurisdiction in the reactor field."32

Strategically, Nichols did not think the Army "should raise any issues concerning procedure and justification at this time." Instead, he thought Lampert could work directly with Dr. Hafstad to develop plans for the best means of initiating the Program. In fact, Nichols informed Pace that Lampert had already established a liaison with the AEC through Hafstad and had begun his work. He also provided the Secretary with a draft reply to Dean's letter, which advised the AEC Chairman of the arrangement.33

Initially assigned in the Chief of Engineer's Office to the Assistant Chief of Engineers for Troop Operations, Lampert had begun working with Hafstad in the AEC's Reactor Development Division on an informal basis. Hafstad provided him with a desk in the Civilian Reactors Branch in order to give him access to nuclear experts both in the government and in private industry. Lampert also quickly approached Adm. Rickover but obtained an interview only with some "difficulty."

As Lampert recalled, the Admiral greeted him by saying, "I understand you want to build nuclear power plants for the Army. My advice to you is that you don't know what you're getting into and the best thing you can do is get out of it in a hurry." Despite the coldness of his introduction, Rickover did provide Lampert with a great deal of technical materials from the Naval Reactors Group Library and had one of his assistants brief him on the progress of the Navy's reactor program. 34

For the most part, Lampert's first months of work consisted of a series of data gathering meetings. At the AEC, he continued to encounter resistance in part because the Army still had not demonstrated a formal requirement for a nuclear power plant and the Commission was very reluctant to allocate funds without such a justification. At the same time, because the AEC was encouraging private industry to begin work on commercial nuclear power plants, Lampert was told to wait until he could use the results of their investigations. From other people whom he met, however, Lampert found a "rather affirmative attitude." The consensus of opinion was that the Navy's reactor program offered no immediate economic payoff in the field of energy production. Consequently, there was an interest in seeing another government nuclear program started that would offer the potential for the development of military nuclear power plants on land and could contribute to the advance of commercial nuclear power.35

advance of commercial nuclear power.

*Apart from gathering information and receiving encouragement to move ahead, Col. Lampert's efforts received a boost when he obtained an assistant, **Capt. William B. Taylor**, who had been working in the Armed Forces Special Weapons Project. Arriving in October, **Taylor** initially devoted his attention to studying the military procedures for starting a new technical program. He and Lampert also began surveying the Army's power requirements as well as the power requirements of the other armed services for which the Chief of Engineers had responsibility. By November 10, when the Nuclear Power Division was formally activated within the Office of the Chief of Engineers, Lampert and **Taylor** had concluded that the key to getting the Army's Program underway was to get an official statement from a high level in the Pentagon stating that a military requirement existed for the development of nuclear power plants. According to Lampert, this "charter," based on the early Army memoranda and his many discussions, proved "invaluable ... because I was never bothered by anybody in somebody's outer office trying to say, 'You can't talk to my boss because you haven't come through channels.' I think that if I had not had that sort of a general license to operate freely, it would have been much more difficult than it was to get started."36*

*While Lampert and **Taylor** were conducting their preliminary technical and feasibility studies, Gen. Nichols continued his own efforts to advance the Army's Nuclear Program. Following the 1952 presidential election, Nichols visited Adm. Lewis Strauss in New York on December 3, to describe his initiatives toward developing an Army atomic power project and to seek Strauss' support after President Eisenhower's inauguration. Strauss, one of the original members of the AEC and then an adviser to the President-elect on nuclear affairs, gave his "hearty concurrence"' to the Army's plans. Later, this interest and encouragement translated into valuable assistance when the Army's Program ran into serious AEC objections in the spring of 1953.37*

*In the meantime, Lampert and **Taylor** pursued their research with the assistance of the Engineer Strategic Planning Group, the Operations Research Office of John Hopkins University, and several engineer officers, who had relevant scientific backgrounds and were on temporary assignment in the Chief of Engineer's Office. The survey of military requirements focused on power needs in remote areas—in the Mediterranean and the Middle East—the feasibility of floating nuclear power plants, and the use of mobile power plants for direct support of tactical units. To Lampert and **Taylor**, the most convincing argument in favor of military nuclear power plants related to the logistics of producing electricity and steam in remote areas. As Lampert saw it, once a power plant was in place and running, the military "would then have electricity practically indefinitely and [it] would not have to bring any fuel to keep the plant going."38*

To justify the requirement to the AEC, the two officers decided to pick out locales where the Army was then generating electric power, but at high cost and with great difficulty due to the transportation problems. Their preliminary comparisons between the cost of conventional power and nuclear power led them to look specifically at military bases in such places as Northern Greenland and Alaska, where the logistical problems of delivering diesel fuel suggested that nuclear power plants might be a viable alternative. Because the Air Force had bases in such remote areas, it became involved in the study and supplied the Nuclear Power Division with much of its preliminary logistical information. Although the Navy ultimately expressed an interest in the Army's Program because of its base in Antarctica, the service provided few leads during the initial research phase because its overseas bases were accessible to the sea and usually in moderate climates.39

*With Lampert's preliminary studies well under way, on February 2, 1953, the Army Nuclear Power Division issued an Interim Report titled Army Nuclear Power. In it, Lambert and **Taylor** concluded that a military requirement did exist for electric power plants for use at remote bases and in prospective theaters of operation. Their research indicated that nuclear power plants might be technically feasible as well as both militarily and economically justified to fill a specific portion of this requirement. Although they acknowledged that the construction cost of a nuclear power plant would he more than that for a conventional plant, diesel or oil delivery costs could exceed the first-cost differential after only a few years of operation at some remote military bases. They said that further study was needed to ascertain the required characteristics of military nuclear power plants and this could be accomplished through the current research. In addition, they recommended that a technical feasibility study of reactor concepts and designs be undertaken in order to select one concept for development and to set forth the building program. They suggested that this study should be done, preferable on a contract basis in the "immediate future."40*

Lt. Gen. Samuel D. Sturgis, the new Chief of Engineers, approved the Report and sent it up the chain of command to the Military Liaison Committee. The Committee concurred with the findings in the Interim Report and transmitted it to the AEC on March 23, 1953. Moreover, the new Secretary of the Army, Robert Stevens, advised the Chief of Staff on April 13, that he "wholeheartedly" subscribed to the Corps of Engineers' objective to "explore vigorously all possibilities of atomic application in meeting military requirements." Consequently, he offered "full support to all programs" in the field.41

In turn, Gen. Nichols helped prepare the letters that formally established Col. Lampert's position and authority and then wrote the letter to Gordon Dean and the AEC, which accompanied the Interim Report. Nichols recalled that he wrote the letter "in such a fashion that I felt that it would not be turned down." It proposed that the Army offered to pay for the nuclear project, let the AEC pay for it, let the AEC run it, let the Army run it, or run it in the way Adm. Rickover was running the Navy nuclear submarine program. Nichols recalled that the Army "did not prescribe any procedure for doing it, with the idea that we did not want to get into an argument with the AEC about how it be done or how it be funded." Nevertheless, the Commission rejected the Army's proposal, according to Nichols, because some of the Commissioners were worried that the Engineers were getting back into atomic power.42

In analyzing the situation in order to respond to Secretary Stevens, Brig. Gen. Kenner F. Hertford, Assistant Deputy Chief of Staff for Research and Development, concluded that the turndown "apparently arises from the current importance of the general industrial atomic power picture in both the executive branch and the Congress as well as from a feeling that the AEC must keep the initiative in this field." At the same time, Hertford cited President Eisenhower's statement in a National Security Council meeting in late March in which he said that he didn't want Defense Department funds used to develop nuclear power plants that could be used for industrial purposes and so compete with present commercial power plants. Hertford also mentioned the controversy over the future course of nuclear power development and suggested that until the Legislative and Executive branches of the Government had established a national policy, it was "considered inadvisable" to ask the AEC to take any further action in regard to the Army's program.43

Despite the reluctance of the AEC to allow the Army to become involved in nuclear power, the Commission did direct Dr. Hafstad to push studies of small reactor designs that would be applicable to the Army's interest. As a result, Hafstad was proceeding with a technical study at the Oak Ridge National Laboratory, which would provide analyses to meet the Army requirements and to which Lampert would have ready access because of Hafstad's "strong personal support" of the Engineers' investigations. Consequently, although the Army's proposed research contract to study the feasibility of a military requirement for nuclear reactors could not be given out, Hafstad's Oak Ridge Study was expected to provide Lampert with most of the information he would need.44

The Oak Ridge Laboratory expected to complete its study by late summer. The Army would then be able to establish a firm military commitment for its program. In addition, Hertford noted in his analysis to the Chief of Engineers that the AEC would be under new management by then and the Army could expect that "decisions concerning AEC policies in the nuclear field may be somewhat clarified." Furthermore, he explained that the whole question of the future course of nuclear power development is highly controversial. Some factions believed the AEC should demonstrate the feasibility of several types of reactors because of the multimillion dollar investments necessary. Other factions believed the current Atomic Energy Act should be changed to get the government out of the nuclear power development business. In any case, until a national policy was established, Hertford did not think the present AEC would support an Army contract with private industry to develop small nuclear plants for military use.45

On his part, following up on the AEC's rejection of the Army's proposal, Gen. Nichols met with Adm. Strauss on May 13 in an attempt to obtain his assistance in reversing the decision. The President's adviser on energy matters suggested that the Army should prepare the studies recommended by the AEC in order to prove more precisely the military's need for atomic power plants. According to Nichols, Strauss' counsel of continued research and patience resulted from the Admiral's knowledge that he would become an AEC commissioner or the Commission's chairman in the near future. He would then be in a position to give the Army's Program a more a favorable reception.46

Nichols also reported the situation to Secretary Stevens in a letter dated May 27. Agreeing with Hertford's analysis, he told Stevens that the Commission was undergoing changes in composition at the same time as the Atomic Energy Act was in the process of legislative review and revision. He also explained that the Department of Defense had also "indicated a general unwillingness to support military atomic power projects unless there is a clear-cut military requirement for some." He did, however, cite the Army's progress to date, including the Oak Ridge National Laboratory's study of small nuclear reactors of the type the Army needed, the liaison established between Col. Lampert and the AEC, and Lambert's continuing research into the military's justification of nuclear power plants. Finally, Nichols reported to Stevens on his meeting with Adm. Strauss, saying that the Admiral had indicated that nothing in the Administration's nuclear power policy would prevent the Army's Program from proceeding if it could demonstrate "an economic gain to the use of atomic power in lieu of more conventional power for selected military applications."47

Nichols' progress report proved inadequate in satisfying Steven's request for information on the status of the Program. In a Memorandum to the Army Chief of Staff on June 11, 1953, Under Secretary of the Army Earl D. Johnson described Nichols' Memorandum as revealing "very little progress" and claimed he could find no record of being advised of the Army's negotiations with the AEC or the Agency's refusal to authorize the Engineers to proceed with the project. Responding to Johnson on June 18, Nichols suggested that there had apparently been a "considerable misunderstanding that should be clarified."48

In attempting to clarify the status of the Program, Nichols did acknowledge that it "had not progressed as rapidly as I would desire." However, he maintained that work had gone forward and Secretary Pace had not indicated any dissatisfaction at his last briefing on January 12, 1953, before leaving office. After summarizing developments since then, Nichols repeated the current status of the Program as described in his May 27 memo to Secretary Sevens. He explained to Johnson that Col. Lampert was following Adm. Strauss' advice to determine whether nuclear power could be economically justified over conventional power for selected military application before again approaching the AEC with a request for support. Nichols also indicated that the Program was "assuming that the justification must essentially depend on this alone and not on the basis that the work we would be doing would be of general value in promoting industrial power." Denying that Secretary Pace had not been kept informed, Nichols concluded that "progress made to date is reasonably consistent with the difficulties encountered in carrying forward military work under the present Atomic Energy Act."49

In the meantime, to establish the Army's requirement, Lampert had sought help from the AEC, the Army, and the academic world. He received "a very friendly reception" at the Oak Ridge National Laboratory (ORNL) run by the AEC. Evolving from the Manhattan Project's wartime Clinton Laboratories, ORNL in effect became a technical consultant to the Nuclear Power Division. The Laboratory's director, Dr. Alvin Weinberg, had been one of the early enthusiasts for the development of nuclear power plants for general use; he felt the Army's Program offered considerable promise in helping to develop commercial power. As a result, ORNL became, in effect, a technical consultant to Lampert and the Army's Nuclear Power Program. Working in conjunction with Dr. Hafstad at the AEC Reactor Division, Weinberg agreed to set up a small team within the Laboratory staff to examine the existing nuclear reactor technology and develop some very preliminary designs for suitable power plants. In addition, the team would provide estimates of the plants' characteristics and construction costs.50

While the ORNL research progressed during the summer, Lampert received additional inputs from six engineer officers with scientific backgrounds on temporary duty at OCE. They formed a military study group assigned to the Nuclear Power Division to conduct a detailed examination of the military situation around the world in order to determine sites that offered promise as locales for nuclear power plants. The survey focused on power needs in remote areas, such as the Mediterranean and the Middle East, the feasibility of floating nuclear power plants, and the use of mobile power plants for direct support of tactical units. In addition, the Operations Research Office of Johns Hopkins University, working under a contract with the Army, provided assistance to the research effort by setting up a group to do a detailed study of the economic advantages to using nuclear power in remote areas.51

While these studies proceeded, Adm. Strauss became Chairman of the AEC on July 2, and on July 13 he asked Gen. Nichols to become General Manager of the Commission. Before deciding to accept the appointment, Nichols went to Gen. Matthew Ridgeway, the Army Chief of Staff, to discuss the offer. He explained that he was happy with his current assignment but would accept the position if Ridgeway thought he could better serve the nation in that capacity. Within the Army, some people thought Nichols should remain in the service and serve as the General Manager while still on active duty. Neither Secretary of Defense Wilson nor the AEC approved this option. Ultimately, President Eisenhower made the decision that Nichols should resign from the Army and serve in the AEC as a civilian. He did remain in his military position throughout the summer, then retiring on October 31, and beginning his new job the next day.52

Until he left the Army, Nichols had monitored Lambert's work and, on August 13, he provided Secretary Stevens with an up-date on developments since his June report. Because of the slow progress of Congressional hearings on the development of commercial atomic energy, Nichols wrote that the Atomic Energy Law would not be revised until 1954, with a corresponding delay in any private action to build nuclear power plants.53

In assessing the status of the Army's Program, Nichols said research had indicated "that under various conditions there would be a substantial military advantage to the use of nuclear plants in lieu of conventional plants." He noted that capital costs of a nuclear plant could be within a reasonable range of a conventional facility, operating costs would be lower, and savings in logistics would be substantial. He explained that the ORNL investigation had produced a design that could probably be built for $3 million and he estimated that design and construction of a prototype plant would take three to six years. Nichols therefore concluded that the studies done so far justified continuing and expanding the Army's Program with the objective of building a nuclear facility based on the ORNL work.54

Nichols then provided the Secretary with a two-phase plan for accomplishing this goal. He said all design work could be done in twelve months at an estimated cost of $500,000. The actual construction would require about two years and cost $2 to 3 million. As soon as the Nuclear Power Division had completed its next report at the end of September, Nichols said he would discuss it with Lewis Strauss and at that point the AEC could determine how much of the actual work it wanted to control vis-a-vis the Army's responsibility.55

Following the Secretary's concurrence with the plan on September 1, in his last report before retiring, Nichols provided the Army Chief of Staff with additional information. He said the Nuclear Power Division's Report, now scheduled for completion in October, would recommend that the Army support the design of a prototype nuclear plant that would produce about 1,000 kilowatts of electrical power and sufficient additional steam to heat an arctic installation having a 200-man garrison. According to Nichols, the justification for building such a facility "lies in the fact that 75% of the total logistic support required for such a station would be eliminated by the use of a nuclear power plant." He conceded that this saving would not pay the additional cost of the nuclear plant over a conventional facility in a peacetime situation, but argued that "in time of all-out-war, dollar savings and the assurance of continued operations without dependence on regular deliveries of oil would be an important justification."56

Chapter 2 : Organization of the Nuclear Program

pages 21 to 24

With the Second Interim Report, dated October 30, 1953, Colonel Lampert and the Nuclear Power Division formally established a military justification for the design and construction of a nuclear power plant. The Report concluded that the Army's proposed Nuclear Power Program was compatible with national policy and with commercial interest in the subject. It cited military power and heat requirements that nuclear power plants could meet in remote areas. According to the Report, the small nuclear reactor that ORNL had designed was technically feasible and could be built without delay at comparatively low cost, with a minimum risk. Adapted from Rickover's submarine reactor, the chosen design was a pressurized, watercooled and water-moderated reactor, fueled with enriched uranium. Although not cheaper than a conventional facility in most locations, the Report argued that a nuclear plant could be justified in certain high fuel cost areas on an overall dollar basis. Moreover, in wartime, a nuclear plant could gain a significant advantage because of logistical problems in supplying conventional power plants.1

The Report recommended that the Army build a prototype plant at a site in the United States at an estimated cost of less than $5 million. The initial facility should be quickly followed by a field unit constructed in an arctic location with completion scheduled for late 1958. Although cost of the second unit would depend on the site, the Report estimated $2 to $3 million per year as sufficient funding for the Program. Finally, the Report called for continuing studies to apply advancing nuclear technology to evolving military requirements.2

The Second Interim Report quickly made its way up the chain of command. On November 10, Col. Lampert briefed the Military Liaison Committee about the Nuclear Power Division's research and conclusions. On November 13, the Army requested that the Defense Department provide an appropriation of $500,000 to initiate the design of the prototype nuclear plant during fiscal year (FY) 1954. The service also recommended to the Joint Chiefs of Staff that it establish a military requirement for the development of such a nuclear reactor. In advising the Military Liaison Committee of its actions on December 4, the Army's Research and Development Office requested that when the Joint Chiefs of Staff approved the requirement, the Committee should forward the Second Interim Report to the AEC with the recommendation that it undertake the development program. The Research and Design (R&D) Office also recommended that the Defense Department ask the AEC to undertake the development of the reactor at Commission expense, but explained that if necessary, the Army "is prepared to assist the Commission in funding, or to accomplish the development by direct contract with Commission approval."3

As expected, on December 9, the Joint Chiefs of Staff established the requirement for a military nuclear power plant. On December 14, the Military Liaison Committee advised the Atomic Energy Commission of this action. Nevertheless, the problem of how to fund the Program became an issue almost immediately. On December 16, Donald Quarles, the Assistant Secretary of Defense for Research and Development, stated, "We understand that the Atomic Energy Commission is financing the nuclear power plant design project and accordingly we are withholding the requested funds without prejudice to the planned project." But, on February 11, in acknowledging the Liaison Committee's letter, the Atomic Energy Commission indicated it "presently has no funds available" to spend on the project. Instead it suggested the Army should transfer funds to the Commission "to permit initiation of this work without delay."4

In anticipation of working out funding problems and in accordance with the Joint Chiefs of Staff action, on January 11, 1954, the Chief of Engineers activated the Nuclear Power Branch at the Engineer Research and Development Laboratories (ERDL) at Fort Belvoir, Virginia. This Branch was to act as the Corps of Engineers field agency for the Nuclear Program. The Branch's first chief, Maj. Joseph Bacci, remained resident engineer for both the Army and the AEC during the construction of the prototype nuclear plant from 1954 to 1957. The Branch itself came directly under the technical supervision of the Nuclear Power Division in the Office of the Chief of Engineers.

*Under Col. Lampert, the Division operated as part of the Corps of Engineers Directorate of Research and Development, where it remained until an Army re organization in 1962. **Capt. Bill Taylor** served as Lampert's first assistant from October 1952 to September 1953, at which time he contracted a very severe case of polio as a Major, retired from the Army, and was absent until January 1955, when he rejoined the program as a civil engineer. His loss was at least in part offset by the arrival of Lt. Col. William C. Gribble, whom Lampert described as having provided the Program "tremendous support and assistance."5*

*Col. Gribble had worked in the Los Alamos Scientific Laboratory as a metallurgical engineer from 1948 to 1952, while on loan from the Armed Forces Special Weapons Project. Toward the end of his assignment, he became aware of the Army's developing interest in nuclear power. He also learned that the AEC had given the Army a slot in its new training program in reactor technology located at the Oak Ridge National Laboratory. Discovering that the Army's position had not been filled, Gribble applied through the Chief of Engineers to attend the one-year course at the Oak Ridge School of Reactor Technology and became the first Army officer to enroll in the Program. In January 1953, half way through the course, Gribble met Col. Lampert, who was visiting the ORNL as part of his continuing research. Lampert discussed with Gribble his interest in reactors, the extent of his knowledge of nuclear technology, and asked if he would provide assistance in the development of the Army's Program. As a result, during the balance of Gribble's attendance at the school, he maintained contacts with Lampert and **Taylor**, for the most part receiving information about the Army's interest in small nuclear plants and helping to screen lists of prospective students from Army personnel applying to the school. Before he had ended his year's study, Gribble received orders assigning him to the Nuclear Power Division.6*

*Gribble's arrival inWashington brought Lampert's staff to four, including his secretary. During the next several months, he helped prepare the Second Interim Report. Replacing **Taylor** as Lampert's right-hand man, Gribble then assisted in implementing the Joint Chiefs of Staff's decision to support the Army's Nuclear Power Program. It received official approval on February 10, 1954, when Secretary of Defense Charles Wilson confirmed the Joint Chiefs of Staff development requirement "for nuclear power plants in supplying power for heat and electricity at remote and relatively inaccessible military installations." Wilson also formally designated the Army as the "cognizant agency" in carrying out the requirement.*

By this point, the AEC was finally ready to agree to the Army's original request to establish a joint Army-AEC program as it had done earlier with Adm. Rickover and the Navy. With the help of Dr. Hafstad, the AEC and the Corps of Engineers officially recognized the informal working relationship of the previous 18 months, on April 1, 1954, with the establishment of the Army Reactors Branch in the AEC's Division of Reactor Development. Lampert staffed the Branch primarily with Corps of Engineers personnel and liaison officers from the Air Force, Navy, and other Army technical services. The AEC also allowed Lampert to take initial steps toward establishing a small budget within the Commission, which enabled him to begin recruiting a cadre of civilian technical people on the AEC payroll. At the same time, Lampert worked out arrangements so that his military people were accepted within the AEC as technical members of the Branch.8

On the Army side of the organization chart, the Corps of Engineers concurrently established, on April 1, the Army Reactors Group, also with headquarters at the AEC as a focal point for the military side of the Program. For administrative purposes, the Group was attached to the Engineer Center at Fort Belvoir, but reported directly

to the Assistant Chief of Engineers for Troop Operations. In fact, it remained a relatively small office with the majority of people in the Army's nuclear program working full time in the AEC.9

In practice, the Army Reactors Branch was generally responsible for the research and development of nuclear power plants for land use. Reflecting the increasing importance of the Program, the Chief of Engineers redesignated the Nuclear Power Division, Lampert's initial office, as the Office of Special Assistant for Nuclear Power. The OCE/military element in the dual organization structure became responsible for coordination of Army requirements, dealing with Army and Engineer staff matters relating to nuclear power plants, and planning operational aspects of the Program. Because of his dual role as head of both the Army Reactors Branch and the Office of Special Assistant for Nuclear Power, Lampert was able to provide close and continuous coordination of the program.10

Before beginning actual work on the prototype nuclear plant, Lampert still had to resolve the matter of funding. In advising the Secretary of the Army of the AEC's position on providing money for the military Program, Maj. Gen. John P. Uncles, the Army's new Chief of Research and Development, explained that the service felt it "highly desirable that this project be contracted on a lump sum basis inasmuch as there had been a strong indication that potential contractors may be willing to undertake this effort at cost or less than cost in order to get established in this field." However, he advised that the service's Nuclear Power Program had never expected a financial commitment of such magnitude in FY 1954 "even though it has been recognized as an important long range development which the Army should certainly support." Gen. Uncles noted that the Program was, in fact, an all-military requirement, that the Second Interim Report was completed by the time FY 1954 budget-planning had been finalized, and that the AEC should normally be expected to fund a nuclear program such as the Army's. Consequently, he advised Secretary Stevens that "justification existed for requesting that the Secretary of Defense's emergency funds be made available for financing the program."11

Pages 128 to 131 in [HB000C][GDrive]

Facilities Engineering Support Agency (FESA)

As the Engineer Power Group had become an agency in search of a mission by the end of 1973, the Corps of Engineers was seeking an agency to undertake a new assignment. In addition to its civil and other military engineering assignments, since the end of World War II the Corps had supplied Engineer officers as post engineers to operate utilities and maintain facilities on Army bases. For the most part, in the decades of the 1940s, 1950s, and 1960s, the officers assigned to these positions were not of the caliber of those who had or were to later receive the important assignments necessary to advance to positions of high command within or outside the Corps.1

Given this reality, the assignment as a post engineer seemed to be a "kiss of death" to a career even if the records showed the officer's performance as post engineer rated as high or higher than his other assignments. In addition to any lack of talent, the post engineer seldom had an adequate staff in quality or numbers to provide him with the professional assistance he needed. When these shortcomings were combined with the lack of resources in funds and engineering support from the Corps itself, a low level of post maintenance usually resulted. Such deficiencies in men and actions gave rise to a bad image for the Corps within the Army itself.2

In 1968, in recognition of this and related problems, the Army Chief of Staff had initiated a study to provide a comprehensive analysis of the total management of the service's real property maintenance activities. Lt. Gen. L.G. Lincoln headed the study group that examined all reports of previous investigations and did its own research and analysis. Unlike the earlier studies whose recommendations "were rarely if ever carried out," according to Lincoln, his work gave new impetus to the operation and maintenance of the Army's facilities. A subsequent study described the Lincoln recommendations as giving "new direction and impetus" to the Army's operations and maintenance of its Real Property and "a ten year benchmark" for subsequent analysis.3

To deal with the need to provide engineering support for post facilities, the Lincoln Study Group recommended that the Army allocate funds to be controlled by the Chief of Engineers. This money would then be further allocated to districts, which would enable facility engineers to obtain engineering assistance without payment from their own resources. In regard to the facilities engineer, as Gen. Lincoln and his Study Group chose to rename the position of post engineer, the Study Report recommended that the selection of the officer be made on the same basis as any Engineer officer being assigned to a Corps of Engineers district. Not only would the man be "one of the best," according to Lincoln, but he would also subsequently be given the same consideration in personnel evaluation as an officer who had served in a district. The ultimate effect of this change would be to provide a better caliber of officer who would then be perceived in a better light by both peers and superiors, would have a reason to make a record for himself while in his assignment, and would be able to acquire engineering expertise that would he useful in his later career.4

To accomplish an assignment, however, the facilities engineer would also need support from an organization capable of providing broader assistance in emergency situations such as the breakdown of electrical-generating equipment and heating plants. In implementing the Lincoln Study Group proposals, Lt. Gen. W.C. Gribble, the Chief of Engineers, had the logical candidate to assume the assignment: the Engineer Power Group had capabilities he knew well after a long relationship.

*Gribble had joined Col. Lampert and **Maj. Bill Taylor** in September 1953, during the research and start-up phase of the Army's Nuclear Program and had become the number-two man in the organization. He was later the Alaska District Engineer responsible for the construction of the SM-1A and, in the mid-1960s, had become the Director of the Army Reactors Group. Consequently, in response to Chief of Staff Gen. Creighton Abrams' order to implement the Lincoln Study and upgrade facilities on Army bases, Gen. Gribble knew where to turn. Moreover, he appreciated the possible resistance within the organization to the shift in mission to what many considered a less glamorous assignment. Nevertheless, with the Nontactical Generator Program its only significant mission, the Engineer Power Group was clearly in a situation where it had to take on additional activities, particularly if it was to maintain its individual identity in the Corps of Engineers.5*

*In announcing its new mission to the Engineer Power Group staff meeting on January 14, 1974, Maj. Mark Magnussen, then the Deputy Commander and Director of the Agency, explained that the organization would now be under the Facility Engineering Directorate in OCE instead of in the Military Construction Directorate. The change meant that the Power Group would "become more facility engineering oriented." To help set up the new assignment and its operation, Magnussen told the staff that the Chief of Engineers was sending to the headquarters **Bill Taylor**, Col. Lampert's assistant during the birth of the Nuclear Program, to study the current state of affairs as a consultant and make recommendations. 6*

Gribble, the Chief of Engineers, had initiated the changes in organization by deciding to create the Facilities Engineering Directorate within the Corps of Engineers headquarters organization, elevating it from division status with the Military Construction Directorate. Up to that time, Military Construction had the responsibility for both the Army's new construction and for the operation and maintenance of Army facilities. By making the Facilities Engineering Directorate a separate entity, Gribble thought it would be better able to cope with the complex requirements of facilities engineering on the Army's installations worldwide.7

*The first director of the new Directorate, Brig. Gen. William Wray, had been Officer in Charge of the initial SM-1 crew that operated the plant under ALCO's supervision. He had taken part in the original nuclear engineering training program, had worked with Lampert and Gribble in establishing training procedures for power plant crews, and then served as the Nuclear Power Program's first Chief of Operations and Training. As a result, he was sensitive to the changes the Agency had undergone through the years. From Gribble, Wray received guidance about areas on which he should concentrate in his new assignment, particularly in applying the talent that existed in the Engineer Power Group to the problems faced by the facility engineers on Army installations. With **Bill Taylor**'s help in examining the Agency and with his recommendations, Wray reorganized the power Group and gave it a new mission.8*

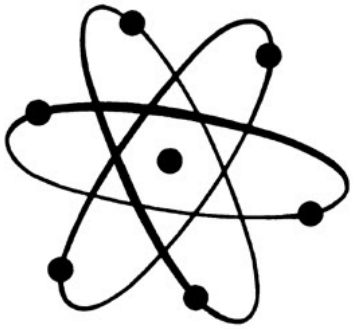
A giant stride toward self-sufficiency in heat and power at isolated stations is provided by the Army's



NUCLEAR POWER PROGRAM

William B. Taylor

THIS SPRING the Army Package Power Reactor (APPR-1) began generating electrical power from nuclear energy at Fort Belvoir, Virginia. The APPR-1 is the first of a family of military nuclear power plants being developed under a joint program of the Army and the Atomic Energy Commission (AEC). As the first military reactor built in this country primarily for the production of electrical power, the APPR-1 is a forerunner of field plants designed to provide compact reliable systems for supporting vital overseas military operations where logistics of conventional fuel is difficult and expensive.

Development of the APPR-1 marks the culmination of five years of combined effort by the U. S. Army and the Atomic Energy Commission to build this first pilot plant on behalf of the Department of Defense.

MAJOR WILLIAM B. TAYLOR, USA-Retired, is on the staff of the Corps of Engineers Research and Development Laboratories, Fort Belvoir, Virginia.

Built for the Army under an AEC contract by Alco Products, Inc., of Schenectady, New York, for about $2,400,000, the plant will be turned over to Army control following completion of extensive tests. The total cost of the plant, including supporting research and development by the Army and AEC, is somewhat greater than the direct cost of design and construction indicated by the contract price. Succeeding plants of course should not cost as much, and already plans are being worked out for the succeeding types that will be made available for military uses.

Basically, the APPR-1 project has three major objectives:

- *First*, to prove by actual operation the feasibility of the design which incorporates some significant departures from previous reactor experience.
- *Second*, to provide operating data and experience on which to base design, construction and operation of similar plants in remote areas.
- *Third*, to provide a facility

Digitized by Google

[HG000B][GDrive]

for training military crews for operation of remote plants.

Quite obviously, the first two objectives will require time since, as with any operation of this nature, performance must be observed closely, records must be kept, possible weak spots carefully noted and corrected, and in general the entire equipment must prove itself in every respect.

The third objective, however, was actually well in process of being realized by the time the operation began. To procure the skilled technicians to run the first plant, the Corps of Engineers in April 1956 inaugurated a new branch of its military engineering activities. Thirty-four members of the Armed Forces and one civilian were sent to the University of Virginia for a special basic preparatory course in the fundamentals of nuclear power plant operation.

After five months at the University, the trainees, representing all of the services, were assigned to on-the-job training at Atomic Energy Commission laboratories and contractors' plants. From this group will be drawn instructors for the school that now is being set up by the Corps to train others in operation of military nuclear reactor power plants. The Corps of Engineers is performing this training function for personnel of all the armed services.

THE Army Nuclear Power Program at present includes projects covering three general types of military power plants—fixed, semimobile, and mobile. In addition, special purpose plants for certain specific needs other than electricity and heat also are being studied.

FIXED POWER PLANTS

ALTHOUGH termed "fixed plants," this type is being designed so that major components may be transportable in C-124 aircraft, and the plants can be assembled in a few months, using relatively standard construction methods. All but the heaviest components and those such as the reactor vessel (which may be quite radioactive after use) will be salvageable for use elsewhere.

This type is to be used at relatively permanent installations in remote areas, such as the arctic, where fuel logistics is difficult and expensive. It is the tremendous "power density"—or obtainable energy per pound—of nuclear fuel when compared to conventional fuel, that gives promise of great savings in operation despite probable high initial costs.

Thus a pound of enriched uranium in the APPR-1 can deliver about 2,600,000 kilowatt-hours of energy compared to about 1½ kilowatt-hours that can be delivered by a pound of diesel oil in standard generator sets. The APPR-1 is designed to operate at full power for over a year on a single fuel loading smaller than a barrel and weighing only a few hundred pounds (of which about 50 pounds is active nuclear fuel). When this is compared with a diesel plant that would need some 50,000 barrels to produce the same amount of energy, it is readily seen that tremendous savings in hauling costs are possible from nuclear systems.

At some remote bases, fuel requirements for heat and power alone account for 75 percent of the

Digitized by Google

[HG000C][GDrive]

total annual logistical supply requirements. Oil for certain arctic bases, it has been found, may cost more than $42 per barrel due to the necessity of flying it in.

Analysis of nuclear power plant costs as compared to an oil-fired plant at a remote base supplied wholly by airlift indicates that, after about five years of operation, the cumulative cost of the nuclear system may be less, even though its initial cost is greater.

The fixed type plant in remote areas could pay for itself over a period of years. In wartime, when conventional fuel supplies might be endangered or cut off, the nuclear plants very obviously would be of strategic value far exceeding that measurable in monetary terms.

BESIDES the APPR-1, the fixed plant category includes the Argonne Low Power Reactor (ALPR), a prototype plant with about a tenth the electrical output of APPR-1. Construction is planned to start this year at the AEC's National Reactor Testing Station, Arco, Idaho.

The ALPR is designed to meet Air Force specifications for utilities —about 200 kilowatts of electricity and 1,300,000 BTU's per hour in steam for space heating—at DEW-line installations in the Far North. This type plant is also of interest to the Army and Navy for possible use in polar operations.

Still another fixed-type plant, now in the preliminary design stage, is a larger unit capable of supplying about 20,000 kilowatts of electricity. This could be used advantageously at oversea bases in temperate-climate areas, where the problem of supplying ordinary fuel is difficult.

Designs have also been prepared for plants that would provide heat only. By eliminating the requirement for production of high quality steam to drive an electric generator, such plants could be built with much less complexity and weight.

At the control board, this Army Master Sergeant keeps close check on the functioning of the package power reactor plant.

Digitized by Google

[HG000D][GDrive]

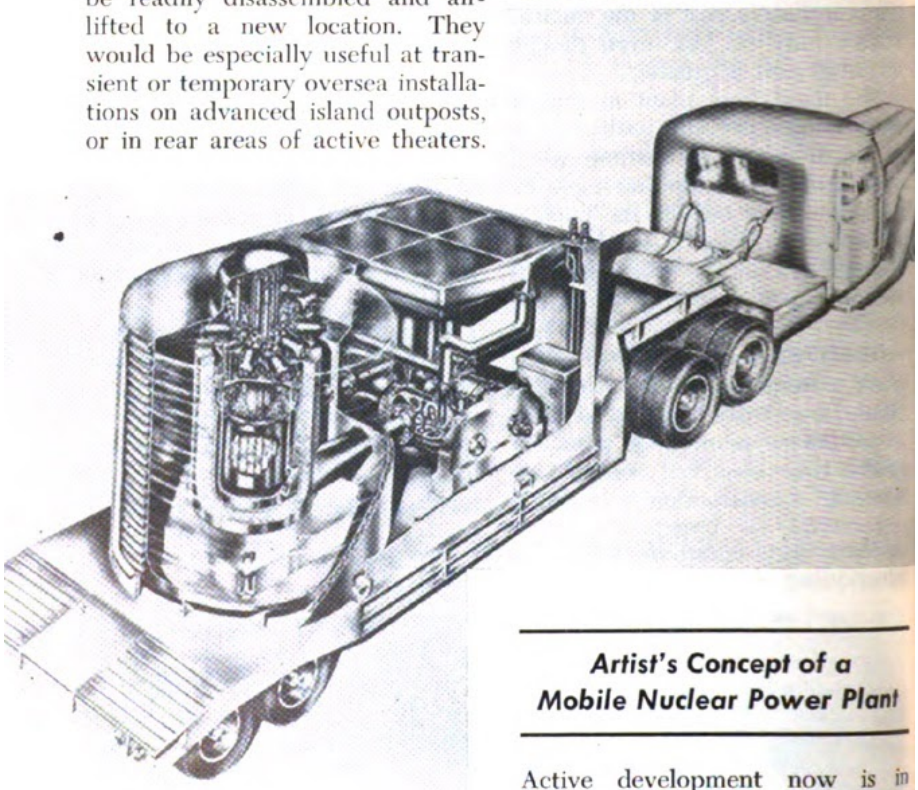
SEMI-MOBILE PLANTS

KNOCKDOWN type plants, made up of air-transportable modules and capable of being assembled in a matter of days, rather than months, could furnish several thousand kilowatts to a major military complex in a relatively static situation. These could be readily disassembled and airlifted to a new location. They would be especially useful at transient or temporary oversea installations on advanced island outposts, or in rear areas of active theaters.

Feasibility studies and preliminary designs now are under way for such plants. They would require only insignificant fuel and water supplies and would utilize field expedient radiation shielding materials to reduce plant weight. However, a prototype plant is not expected for several years because of difficult problems involved in developing reactor materials and components.

MOBILE PLANTS

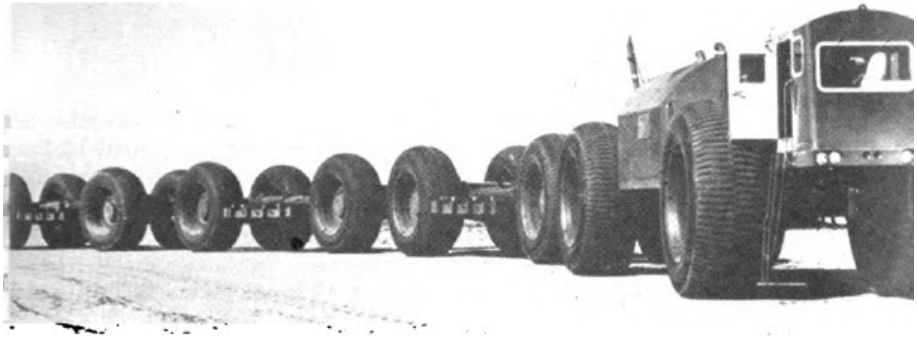
SMALL, compact systems designed for mobility by air, land or water also are being planned.



Artist's Concept of a Mobile Nuclear Power Plant

Active development now is in progress on a reactor and its associated power generating equipment that can be mounted on a flatbed trailer or railway car, and could be airlifted complete in a C-124 aircraft. Plants of this type, with outputs of several hundred kilowatts and essentially free from fuel and water supply problems, would be useful in remote, arid areas and

[HG000E][GDrive]



The Army Transportation Corps is studying possible application of nuclear power in diesel-electric overland logistic cargo carriers like this Sno-train.

for field hospital and depot power supply in an active combat theater. Such plants would also be valuable in support of missile operations.

Design work also is progressing on nuclear plants packaged in barges similar in size to the oil-fired barge-mounted power plants which were used by the Army to furnish power during World War II, and in Korea and Okinawa. The Navy's Bureau of Yards and Docks is studying barge-mounted reactor plants. These could greatly reduce tanker space required to support overseas mobilization bases or polar operations. They also would be of value for use in disaster areas.

SPECIAL PURPOSE PLANTS

IN ADDITION to plants designed for production of power and heat, the Army and the AEC are studying and developing reactors for other military uses. The Army Quartermaster Corps has an active program to determine the practicality and advantages of preserving foods and materials through intense ionizing radiation. Experiments have been conducted (See "Preserving Food by Radiation," October 1956 DIGEST) and a project now is underway to build a U.S. Army Ionizing Radiation Center at Sharpe General Depot in Stockton, California. This facility will include an electron accelerator as well as an intense gamma source built by AEC.

The Army Transportation Corps is studying possible uses of nuclear energy in feasibility and design studies on a reactor-powered overland cargo carrier, patterned after the existing diesel-electrical driven, pneumatic-tired "sno-train." (See "Supporting Far North Operations," July 1956 DIGEST). Such a vehicle could haul large cargoes for almost unlimited ranges in remote areas without refueling.

Thus the APPR-1 is a first step in a continuing program to build lighter, more compact nuclear power plants that would reduce the military logistic load in a number of ways.

WORK on the Army Nuclear Power Program began in 1952 when the Corps of Engineers was directed to study the non-destructive military uses of atomic energy. Following a year of study by the Army and the AEC's Oak Ridge National Laboratory, the Joint Chiefs of Staff by 1953 issued a requirement for development of such plants in a range of output

Digitized by Google

[HG000F][GDrive]

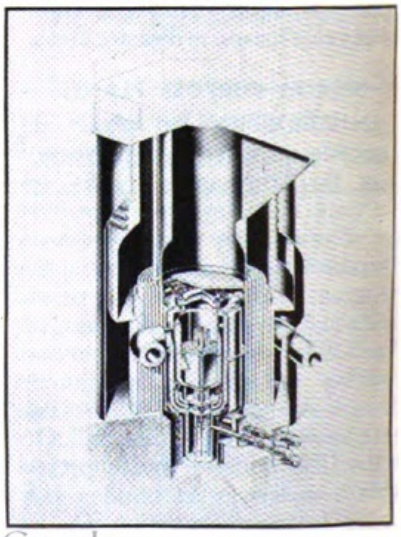
capacities ranging from a few hundred to some 40,000 kilowatts. The Army was directed to carry out this development with the AEC for all the military services.

The Corps of Engineers was designated the Army's agent for conducting and co-ordinating research and development in this entire field. Responsibility for military application studies, development of non-nuclear components and training of nuclear power plant operators was assigned to a Nuclear Power Branch in the Engineer Research and Development Laboratories at Fort Belvoir. This came under direct supervision of the Special Assistant for Nuclear Power on the staff of the Chief of Engineers. Development of the required reactors was made the responsibility of an Army Reactors Branch in the AEC. To assure maximum coordination of both efforts, Colonel James B. Lampert, USA, was assigned concurrent duties as director of activities both in the AEC and in the Corps of Engineers.

These combined activities now include some 100 assigned personnel, about 75 being Corps of Engineers military and civilian engineers and technicians; and the remainder representing the Air Force, Navy, AEC and other Army services.

Model of APPR-1 shows interior of vapor container which includes reactor and primary system components. Enlarged cutaway view of reactor core (right) shows concrete and steel shielding rings, reactor pressure vessel, control rods and drives, and primary coolant piping.

BUILDING of APPR-1 was based on a conceptual design prepared by Oak Ridge National Laboratory. Electric power is produced from any reactor system by removing heat from the critical mass of nuclear fuel and then using the heat to drive a turbine which in turn drives a more or less standard generator. In the APPR-1, heat



Digitized by Google

[HG000G][GDrive]

is removed from the reactor by water pumped through the fuel core under pressure so high that it prevents boiling. A heat exchanger transfers the heat from this high pressure water to a secondary steam system which drives the turbine-generator.

The exhaust steam from the APPR-1 turbine is condensed by cooling water from the Potomac River, and then is returned to the heat exchanger, supplemented by purified make-up water obtained from the local water system. The reactor with attendant nuclear radiation is completely isolated from external sources of cooling water, and there is no possibility of introducing radioactivity into adjacent water supplies.

All components of arctic versions of the APPR-1 will be designed to be transportable by air. Present planning calls for the capability of installing such a plant within a six-month construction season. "Air transportability" specifications require that no component exceed a weight limit of 10 tons, or a size limit of 7x18 feet. The turbine-generator and main condenser at Fort Belvoir were excepted—but for arctic plants or others in remote areas, these exemptions probably will not be allowed.

Another feature of the APPR-1 that would not necessarily be incorporated in plants at remote bases is "containment." At Fort Belvoir, a "vapor container"—a large, cylindrical, vapor-tight, steel and concrete shell—encloses the reactor itself and all components through which flow the high pressure reactor cooling water.

The container is designed to confine safely all of the radioactivity that could possibly result in the unlikely event that all of the other interlocking safety factors should fail to shut the reactor down first. In the APPR-1, this doubly cautious design accounts for about 20 percent of plant construction costs and greatly increases the size of the prototype plant over what might be expected in a field version.

In sparsely populated areas, such super-safety features may not have to be incorporated. In any location, however, certain basic physical considerations limit reduction of size and weight of nuclear power plants. The most significant factor is that a minimum mass of material is required as radiation shielding. In the APPR-1, the shielding consists of appreciable amounts of iron, water and reinforced concrete.

Ingenious combinations of special materials and new geometric arrangements can reduce this weight by a few percent, but reduction in shielding weight by large amounts cannot now be foreseen. The use of local expedient materials such as dirt, sand or gravel is expected to permit building a safe reactor in the small size required for use in semi-mobile or mobile plants.

Dedication of the APPR-1 marks another significant milestone in Army history. With the opening of this first package power reactor for production of electricity on a utilitarian basis, the U. S. Army, which pioneered in production of atomic energy for destructive purposes, has helped open new vistas to greater uses of nuclear energy for the benefit of all mankind.

Apollo Program Not One-Shotter

ST. LOUIS, Mo. (AP) — Project Apollo is not just a one-shot, $20-billion program to land two Americans on the moon in this decade, an official of the National Aeronautics and Space Administration said today.

Instead, he said, the equipment, technology and personnel being developed will be used to thoroughly explore space out to the moon and to bridge a gap between Apollo and more ambitious manned planetary and other expeditions envisioned by 1980.

William B. Taylor, director of NASA's Apollo Extension System's office, outlined the advanced Apollo plans on the opening day of a three-day conference on manned space flight.

These Missions

Taylor said the basic three-man Apollo rocket and spacecraft will be used for these missions:

—Earth orbit flights out to as far as 22,300 miles for periods ranging from 14 to 45 days. If a supply ship is developed to rendezvous with these stations, the time could be extended to three months or more.

—Moon orbit flights of up to 28 days during which the three-man crew will thoroughly survey all areas of the lunar surface from as close as 30 miles.

—Maintaining two men on the lunar surface for up to two weeks after first landing an unmanned supply ship.

A total of 20 advanced Apollo flights is planned, with the first scheduled in 1968, even before the first Apollo team sets sail for the moon.

Taylor said the program "is to use the capabilities being developed for the lunar landing as a technological bridge to more extensive manned space flights in the 1970's and 1980's."

The goal, he said, will be to select the most promising experiments "which can be flown on Apollo or Apollo-like spacecraft during 1968 to 1972, and which can provide the essential ingredients leading to major space ventures in the next decade."

Four Categories

He said extensive studies have reduced a potential list of several hundred experiments to 150, in these four broad categories:

—Space technology and operations, including 25 experiments on an astronaut leaving an orbiting craft, advanced systems and materials and space flight operation.

—Space sciences and applications, including 71 experiments in such areas as astronomy, astrophysics, biomedical and behavorial sciences, atmospheric and meteorological sciences, communication, navigation and traffic control.

November-December 1974 update

CSC Approves Taylor for PL-313 Appointment

U.S. Civil Service Commission approval of the appointment of William B. Taylor as assistant to the Chief of Engineers for Research and Development and chief of the Corps of Engineers R&D Office was announced Oct. 14. Taylor's selection for the prestigious PL-313 position climaxes a 29-year association with research and development programs, all of it with the U.S. Army except for 1962–67 service with the NASA Office of Manned Space Flight (Apollo and Apollo Applications).

William B. Taylor

Graduated from the U.S. Military Academy with a BS degree in engineering in 1945, Taylor served as an officer until August 1954 with the Combat Engineers in Europe, the Special Weapons Operation at Sandia Base, NM, and Eniwetok Island, Special Weapons Test Planning in the Pentagon, and the Nuclear Reactions Studies, Washington, DC. He retired on physical disability.

Appointed to a U.S. Civil Service position in January 1955, he served five years with Army-AEC Nuclear Power Reactor Development (Construction Operation and Training), Washington, DC. Two years with the Army R&D of Mapping and Geodetic Space Applications at Fort Belvoir, VA, preceded his transfer to NASA.

Upon his return to the Army in May 1967, he was scientific adviser for Missiles and Space, Office of the Chief of R&D, Department of the Army, serving in that capacity until January 1969. For the next four and a half years he was the technical director, U.S. Army Mobility Equipment R&D Center, Fort Belvoir. He has been a private consulting engineer since May 1973, including service with the Army Corps of Engineers.

His educational qualifications include training in radiological engineering at the U.S. Navy PG School in Annapolis, MD, a master's degree in Radiological Engineering in 1951 from Johns Hopkins University, a course in systems engineering at Mathematica, Inc., Princeton, NJ, and completion of the Federal Executive's Institute curriculum at Charlottsville, VA.

[HG0008][GDrive]

2011 (April 3) - William B Taylor Sr. Passes

Source : [HL000J][GDrive]

William B. Taylor Sr., 86, a director of research and development for the Army Corps of Engineers when he retired in 1981, died April 3 at Inova Mount Vernon Hospital in Alexandria of respiratory failure.

Mr. Taylor started his career with the Corps of Engineers in 1945 after he graduated from the U.S. Military Academy at West Point, N.Y. He was briefly assigned to the Manhattan Project, the Allies' effort in World War II to build an atomic bomb.

He left active duty in 1955 and, during the late 1950s, was a civilian engineer and research manager with the Army Nuclear Power Program. From 1962 to 1967, he was director of NASA's Apollo Applications Program before he rejoined the Corps of Engineers at the Pentagon.

William Brockenbrough Taylor, a native of Norfolk, received a master's degree in engineering from Johns Hopkins University in 1951. During the 1980s, he was an alternative energy consultant for engineering firms in the Washington region.

His honors included the NASA Superior Achievement Award and the Army Meritorious Civilian Service Award.

He was a member of St. James Episcopal Church in Alexandria and had lived in Alexandria since 1951.

Survivors include his wife of 65 years, Nancy Aitcheson Taylor of Alexandria; five children, William B. Taylor Jr. and Anne Cregger Patterson, both of Arlington, Paul K. Taylor and Katharine C. Taylor, both of Manassas, and David A. Taylor of Washington; and 10 grandchildren.

Source : [HL000K][GDrive]

WILLIAM B. TAYLOR,86, a long time Trustee of St. James passed away on Sunday, April 3, 2011.

A founding member of this parish, he and his family attended the first service in July of 1958 in the Woodley Hills School. He was elected to serve on the first Vestry and has over the years served on several Vestries and has been Senior Warden multiple times. Bill was the chair of the Finance Committee responsible for the building of our original church building.

Bill's interests have always supported outreach and mission. He rallied this parish to support programs such as the Advent Episcopal Mission/Church in the Philippines, as well as projects in Mauritania, Sierra Leone, Africa and many others.

For the fiftieth anniversary of this parish, Bill put together a history of the parish with many pictures and interesting stories about the building and the people of St. James' Parish. His attention to detail and sense of humor shine through the pages.

Bill was active at the Diocesan level also, serving on the Diocesan Standing Committee, the governing body of the Diocese and on the Search Committee that called Peter James Lee to be the Bishop of the Diocese of Virginia.

He has lived an amazing life of service to his county as well as his church. Bill graduated from West Point in 1945 and was commissioned in the Army Corps of Engineers. ***He served in the rebuilding of Austria, the Manhattan Project and nuclear weapons testing and reactor studies in the Pentagon following the war.*** *Bill contracted polio in 1953 and after being retired from the Army with his disability and intensive physical therapy, he returned in 1955 as a civilian engineer in the Army –AEC program at Fort Belvoir. Bill was Deputy Director of the Geodesy, Intelligence and Mapping R&D Agency; Director of NASA's Apollo Applications; Scientific Advisor to the Chief of Army R&D; Technical Director of the Army Mobility Equipment R&D Center and Director of R&D for the Army Corps of Engineers. After retiring from Civil Service, he did Engineering Consulting .*

Bill will be remembered as a competent professional soldier, engineer and manager; a trustworthy and loyal friend; a devoted husband, father and grandfather; and a faithful Christian. Bill is survived by his wife of 65 years, Nancy, and five children: William, Jr., Anne, Paul, Katharine and David, their spouses and ten grandchildren.

Bill was larger than life, involved in so many areas of the church, and will be missed by all. He was an example of leading a faithful life. St. James has been blessed by his presence.

DEATH 3 Apr 2011 (aged 86)

BURIAL Arlington National Cemetery , Arlington, Arlington County, Virginia, USA

Virginian-Pilot, The (Norfolk, VA) - Friday, April 8, 2011

William Brockenbrough Taylor, 86, passed away Sunday, April 3, 2011.

He was a U.S. Army veteran and was manager for the Army Corps of Engineers and NASA Apollo program. He was a founder of St. James' Episcopal Church.

He is survived by his wife, Nancy Aitcheson Taylor; his five children, William B. Taylor Jr. (Deborah), Anne Taylor Cregger Patterson (George), Paul Kenneth Taylor (Robin), Katharine Taylor, David Aitcheson Taylor (Lisa); his sister, Betsy Tazewell (John); 10 grandchildren, Dan, Zach, Jake, Sam, Chris, Mary Morgan, Max, Dana, Taylor and Ian.

A visitation will be Saturday, April 9, from 3 to 5 p.m. at Demaine Funeral Home Springfield, and a service will be Sunday, April 10, at 3 p.m. at St. James' Episcopal Church at Mount Vernon Alexandria. Burial will be in Arlington National Cemetery at a later date. His family is deeply grateful for the friendship and skilled care of Joshua Elliott and his

July 8, 2015 - Passing of wife "Nancy Taylor"

See [HL000I][GDrive]

Taylor Nancy Taylor (Age 90) died peacefully at her home on July 5, 2015 after a short illness.

She was an accomplished artist and singer, avid gardener and lover of nature, and a warm and generous friend to all who knew her. She was active in the life of St. James Episcopal Church from its founding in the 1950s, and sang in the church choir, a strong clear voice in the soprano section until just months before her passing.

With her husband Bill, Nancy enjoyed seeing new places. Over the years they traveled to 47 states, Canada, Mexico, Puerto Rico, St. Thomas, St. Croix, Barbados, England, Scotland, Wales, Ireland, France, Belgium, Holland, Germany, Luxemburg, Austria, Italy, Switzerland and Spain. Many of these she commemorated in her art.

Born February 19, 1925 in Alexandria, Virginia, to Virginia Dare and John Kenneth Aitcheson, Nancy had an older brother, John Kenneth Jr. She attended Alexandria public schools, graduating high school in three years due to hard work and an accelerated schedule at the start of World War II. In high school, she played varsity basketball. She graduated from Mary Washington College (now University of Mary Washington) in May 1945 with a bachelor's degree in Art. She and Bill married that June. She worked in the art department of the Hecht Co. and as an art teacher in Alexandria public schools.

She was an active artist all her life, exploring all subjects in media ranging from charcoal and oil painting to pastels and watercolor. She illustrated several books of poetry authored by ***Roberta Newton Taylor, her mother-in-law****. Nancy raised five children, imbuing them with a love of beauty, strength of purpose, and caring. In the fall of 1953 Bill contracted polio, and in many ways she assumed the duties of head of household. For a year that Bill spent in an "iron lung" at Walter Reed Hospital, she visited him daily, driving through Washington, DC and back to their home near Mt. Vernon to care for three small children. When Bill came home from the hospital and pursued a demanding recovery regime of physical therapy, Nancy supported him fully. He said later that his adjustment to life after that "would never have been possible without the daily support and love of my wife, Nance."*

She is survived by five children and their spouses (William B. Taylor, Jr. and Deborah Furlan Taylor, Anne Taylor Cregger Patterson and George Patterson, Paul Kenneth Taylor and Robin Lee Taylor, Katharine Clarke Taylor, and David Aitcheson Taylor and Elizabeth L. Smith). She also leaves ten grandchildren and their spouses: Daniel (and Meg Hopkins) Cregger, Zachary, Jacob and Samuel Cregger; Christopher and Mary Morgan Taylor; Maxwell (and Amanda Sue) Taylor and Dana Taylor; and Mathias and Ian Nace; along with two great-grandchildren. Her family is grateful to the devoted care and friendship of many, especially Joshua Elliott. A memorial service to celebrate Nancy's life will be held on Saturday, July 11 at 2 p.m. at St. James Episcopal Church, 5614 Old Mill Road, Alexandria. Interment with her husband at Arlington National Cemetery at a later date. In lieu of flowers, the family requests donations in her memory to the church. www.demainefunerals.com

RELATED INFO

Brother Rev Lewis Jerome Taylor, Jr

See [HL000F][GDrive]

Rev Lewis Jerome Taylor, Jr

Birth 22 Feb 1923

Death Feb 2011 (aged 87–88)

NORFOLK - The Rev. Lewis Jerome Taylor Jr., husband of the late Pauline Green Taylor and ***father to five****, died in Virginia Beach Feb. 21, 2011, after a brief illness, the day before his 88th birthday. The Rev. Taylor, who was known as "Jay" to family and friends, always sought an engaged and authentic life. He was a beloved member of a large family of Taylors and Tazewells with deep roots in Hampton Roads. The Rev. Taylor was the oldest son and second born to Lewis Jerome Taylor Sr. and Roberta Newton Taylor. He graduated with honors from Granby High School in 1941 and from the U.S. Naval Academy in 1944. He experienced combat in the Pacific aboard the USS Bataan and after the war earned his wings as a naval aviator. After leaving active duty, the Rev. Taylor did post-graduate work at Johns Hopkins University and worked with his father-in-law in agriculture in Clarke County before being called back to active duty for the Korean War. He again left active duty but continued as a Naval Reserve officer, eventually retiring with the rank of commander. The Rev. Taylor felt the call to the ministry while working as partner with his father in the insurance business in Norfolk. He attended Seabury Western Theological Seminary from which he graduated summa cum laude. The Rev. Taylor found the opportunity for an engaged and authentic life in the ministry, which he pursued with great energy for nearly 50 years as an Episcopal priest, theological scholar and prison chaplain. He served for two years as the assistant rector at Williamsburg's Bruton Parish Church and as the Episcopal Chaplain at The College of William and Mary, before accepting the challenge of starting a new church in Virginia Beach, St. Aiden's Episcopal Church. The Rev. Taylor was known at St. Aidan's as a tireless and scholarly priest whose sermons challenged parishioners to listen hard and think deeply about their own search for God's presence in everyday life. In 1968, his personal search took him to Duke University where he pursued his interest in the Christian existentialism of Soren Kierkegaard and the insights of the Louisiana novelist and philosopher Walker Percy, with whom he developed a warm friendship and correspondence. The Rev. Taylor earned the Doctor of Philosophy degree in systematic theology in 1971, with his dissertation titled "The Becoming of the Self in the Writings of Walker Percy: A Kierkegaardian Analysis," which he later published as a book titled "In Search of Self: Life, Death and Walker Percy." After graduation, the Rev. Taylor became a professor at Saint Andrew's Theological Seminary in Manila in the Philippines. In 1977, the Rev. Taylor returned to the United States and the Diocese of Newark, New Jersey, where he served again as a parish priest and founded another mission church, in Chester. The Rev. Taylor retired from fulltime parish ministry in 1985 and returned to Virginia Beach where he served as interim rector at several parishes and as chaplain at the Indian Creek Correctional Center in Chesapeake, while still pursuing his scholarly research and writing. The Rev. Taylor's life of search, authentic engagement and fulfillment found crucial support in his marriage with Polly Taylor. Together they raised three sons, Lewis J.Taylor III, Michael R. Taylor and John B. Taylor; and two daughters, Mary Frances Ridley Vince and Joan Elizabeth Taylor. Mr. Taylor is survived by his five children and their spouses, Lynn Roth Taylor, Christine Lewis Taylor, Cherin Cross Taylor and Ronald Vince; and by his older sister, Elizabeth (Betsy) Tazewell and younger brother, William B. Taylor. His youngest brother, Rev. Robert P. Taylor, died in 1999. The Rev. Taylor is also survived by his grand- children, Lewis J. Taylor IV, Jennifer Taylor, Franklin Taylor, Sara Taylor, Bethany Taylor Etgen, Daniel Taylor, Kyle Vince, David Vince and Tyler Taylor; and his great-grandchildren, Mei-Lian Vader, An-Lian Vader, Robert Taylor, Lindsay Taylor, Emily Etgen, Alex Etgen, Carter Etgen, and Jonas Taylor. The family extends its thanks to the Atlantic Shores Retirement Community for its kind and capable care. The funeral will be held Sunday, Feb. 27, at 1 p.m. in All Saints Episcopal Church, 1969 Woodside Lane, Virginia Beach. Visitation will be held from 3 to 5 p.m. Saturday, Feb. 26, in H.D. Oliver Funeral Apts., 2002 Laskin Road, Virginia Beach. In lieu of flowers, contributions may be made to The Samaritan House, P.O. Box 2400 No. 226 Virginia Beach, VA 23450. Online condolences can be made www.hdoliver.com.*

Brother Rev Robert Page Taylor

[HL000G][GDrive]

Birth 1932

Death 16 Sep 1999 (aged 66–67)

Burial : Unknown, Specifically: location unknown Norfolk Virginia

The Rev. Robert Page Taylor, 67, an Episcopal priest, died Sept. 16, 1999, in his home in Virginia Beach.

Fr. Taylor served the Diocese of Chicago from 1958 until his retirement in 1996. He began his ministry as chaplain to Cook County Prison and was a member of a team which founded St. Leonard's House, a halfway house for persons leaving prison. From 1963 to 1970, Fr. Taylor was the executive director of the agency, guiding it through a time of expansion. He was assistant priest at The Church of St. Paul and the Redeemer in Chicago during the time he was a staff member at Leo J. Shapiro and Associates, a survey research firm. Fr. Taylor joined the Diocese of Chicago staff in 1980 to become director of the Office of Pastoral Care, a service of assistance to Episcopal priests, their families, lay employees and members of Episcopal congregations experiencing difficulties in living.

In 1987, Fr. Taylor was named a Canon of the Episcopal Church when he became director of Program and Mission for the Diocese. This work involved strategic planning for mission parishes and designing overall direction for Diocesan services. In the 1960s, Fr. Taylor was involved in the Civil Rights Movement in Chicago and elsewhere, managing the legal defense funds of those arrested in demonstrations in Chicago. After retirement, he was interim rector of the Church of the Ascension in Chicago, St. Paul's Episcopal Church in Norfolk, and St. Bride's Church in Chesapeake.

Fr. Taylor was also a licensed clinical social worker and a senior certified addiction counselor. He served as consultant to individuals, families and businesses in the field of chemical dependency and mental health.

Fr. Taylor was born in Norfolk and was the son of Jerome and Roberta Taylor. He graduated from Granby High School in Norfolk in 1949. He attended Hampden-Sydney College where he pledged Chi Phi Fraternity. He received a B.A. degree from the University of Virginia in 1953, a Masters of Divinity degree in 1958 from Seabury-Western Theological Seminary, Evanston, Ill., and a master's degree in social work from the University of Chicago in 1982.

His family includes his wife, Carvel Underwood Taylor of the home; four children: Susan Amory of Boston and her husband, David, and their children, Linzee and John; Stephen Taylor of Redondo Beach, Calif.; Joseph Taylor of Chicago and his wife, Wendy, and their children, Joseph Paul III, Terrance and Trevor; and Mary Taylor of Chicago and her son, Christopher Nakutis. He is also survived by his sister, ***Elizabeth Tazewell*** *of Norfolk and her husband, John; his brother, the Rev. Lewis Jerome Taylor of Virginia Beach and his wife, Pauline; and his brother, William Taylor of Alexandria and his wife, Nancy.*

Services will be held at 11 a.m. Tuesday at St. Paul's Episcopal Church, Norfolk, led by the Rev. John J. Capellaro. In addition, a memorial Eucharist will be held at 11 a.m., Oct. 2, 1999, at the Episcopal Church of the Ascension in Chicago by the Rev. Gary Fertig.

Instead of flowers, people are requested to send donations to St. Paul's Theological Library, 201 St. Paul's Blvd., Norfolk VA 23510-2790; St. Leonard's House Educational Support Fund, 2100 W. Warren Blvd., Chicago IL 60612-2310; and Church of the Ascension Music Support Fund, 1133 N. LaSalle St., Chicago IL 60610. H.D. Oliver Funeral Apts., Laskin Road Chapel, is handling arrangements.

2012 (Dec) - John K Aitcheson Jr. (Bill B Taylor Sr's Brother-in-law) passes

John Kenneth Aitcheson Jr. is the brother of Nancy (Aitcheson) Taylor - Wife of Bill B Taylor Sr.

He was also the father of Tipper Gore .

Mr. John K. Aitcheson, Jr.

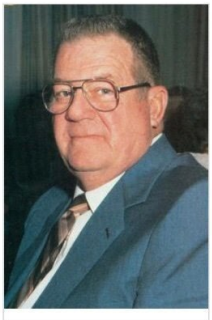
Tribute & Message From The Family



Peacefully on December 26, 2012 at his home in Alexandria, VA. President of J & H Aitcheson Plumbing Supply, he was the son of the late Kenneth and Virginia Dare Clarke Aitcheson. Mr. Aitcheson attended grade school in Alexandria; graduated from George Washington High School and then graduated from Virginia Tech with a degree in Engineering. He was also a veteran of the U.S. Army and served during World War II. Jack was a charter member of Belle Haven Country Club; former member of the Kiwanis Club; and a longtime Alexandria business leader. He was the beloved husband of 35 years to Barbara Chauncey Aitcheson; devoted father of Mary Elizabeth "Tipper" Gore; step-father of Robert, Thomas and James Chauncey; grandfather of Karenna, Kristin, Sarah, and Albert Gore, III, and Jennifer, Crystal, Taylor, and Courtney Chauncey; great grandfather of three; as well as brother of Nancy Taylor; and a friend to many.
Family and friends may gather on Thursday, January 3, 2013 from 1 p.m. until the time of a remembrance service at 2:30 p.m. at Everly-Wheatley Funeral Home, 1500 W. Braddock Rd., Alexandria, VA 22302.

Ruptured heart kills city businessman Antonio J. Taylor

By The New Mexican Staff

Memorial services will be conducted Thursday, Sept. 4, at 11 a.m. at St. John's United Methodist Church for prominent Santa Fe businessman Antonio J. Taylor who died at St. Vincent Hospital Sunday.

TAYLOR

Taylor, 82, died of a ruptured aorta.

In 1927, Taylor opened the Old Mexico Shop at Galisteo, which deals in imported arts and crafts, at Galisteo and Water Streets.

Born in 1904 in Karnack, Texas, Taylor came to New Mexico in 1918 as one of the first students of the Los Alamos Ranch for Boys.

Fluent in Spanish, Taylor had a lifelong love affair with Mexico and became one of the first people in the United States to import huge volumes of Mexican arts and crafts.

Fellow importer Lou Slavitz of New York City said Taylor would scour the Mexican countryside looking for top quality crafts and art. He would advance craftsmen part of the cost of materials and have them discount their wholesale price when they delivered their consignments of goods.

His support and encouragement in developing Mexican arts and crafts for export won him widespread respect and recognition on both sides of the border.

Taylor was one of the first people to use mail order to market his collections of imported merchandise.

In 1940, Taylor was president of the Santa Fe Fiesta Council. In 1968, he served as an informal translator for discussions between then U.S. President Lyndon Johnson and Mexican President Luis Dias Ordaz which lead to the Chamizal Agreement between the two countries.

Johnson was married to Taylor's sister Lady Bird Johnson. The former first lady was a frequent visitor to Santa Fe.

In 1976, Taylor received the rank of Commander of the Order of Isabel La Catolica bestowed by King Juan Carlos of Spain in recognition for his service as vice counsel of Spain in the U.S. southwest.

Taylor was a distinctive figure in Santa Fe, known for his wit, charm and kindness. At Christmas, the Old Mexico Shop would invite the children from the now closed St. Vincent Orphanage to pick out new shoes.

Survivors include his wife Matianna Vigil Taylor; two daughters, Mrs. Jack Hopkins of Santa Fe and Mrs. Diana McArthur of Washington, D.C. and a sister, Mrs. Lyndon B. Johnson of Austin, Texas. Other survivors include four grandchildren, and two great grandchildren.

Taylor will be buried at a private ceremony at Rosario Cemetery. The family requests that in lieu of flowers, memorial contributions be made to the Salvation Army, where Taylor served on the board of directors.

Mrs. Johnson's Father Is Dead

MARSHALL, Tex. (AP)—Thomas Jefferson Taylor, 86, father-in-law of Sen. Lyndon B. Johnson, the Democratic vice presidential candidate, died Saturday in a hospital.

Mrs. Johnson was at the bedside of her father when he died.

Taylor had been in the hospital for some time with a heart ailment. He recently underwent an operation in which his leg was amputated.

Taylor lived in Karnack, Tex., 16 miles northeast of Marshall. He operated a general store and was a large land owner. He at one time owned the land on which the Longhorn Ordinance Works, now operated by Thiokol Chemical Corp., manufacturers of rocket motors, is located.

Taylor was one of the principal financial backers for Johnson's first race for Congress in 1937 when the senator was elected representative to fill the unexpired term of the late Rep. James P. Buchanan (D-Tex).

In addition to Mrs. Johnson he is survived by his wife; a son, Anthony J. Taylor of Santa Fe, N.M.; a sister, Mrs. Ida McKay; three half-sisters, Mrs. J. B. Jones Sr., Mrs. Harris Cory, and Mrs. R. M. Prather, and a half-brother, Cecil Bishop, all of Prattville, Ala. Another son, T. J. Taylor Jr., died earlier this year.

Funeral services will be held at 4 p.m. Sunday at Karnack Methodist Church. Burial will be at Algoma Cemetery here.

Taylor was born Aug. 26, 1874 in Alabama and came to Harrison County when he was 25. He opened a country store which was identified by a sign reading "Dealer in Everything."

Senator Johnson was to arrive here early Sunday to attend the services.

Nixon Attacks His Opponent's Stand On Cuba

ALLENTOWN, Pa. (AP)—Vice President Richard M. Nixon, in his sharpest attack so far, said Saturday that Sen. John F. Kennedy's stand on Cuba "raises a serious question as to whether he has the balanced judgment to be president in this critical period of the 60s."

According to Nixon, Kennedy is "so rash and impulsive that Americans can not sleep well at night."

Nixon put out a two-page statement attacking Kennedy on what was said in their television debate Friday night.

Nixon contended that Kennedy's views could lead to a direct clash

Lady Bird and Lyndon: The Hidden Story of a Marriage That Made a President

Front Cover

Betty Boyd Caroli

Simon and Schuster, 2015 - Biography & Autobiography - 463 pages

2 Reviews

This “smartly written…stunning” (The Boston Globe) portrait of Lady Bird as the essential strategist, fundraiser, barnstormer, and ballast for her husband Lyndon offers “a penetrating analysis…of a marriage that paired two complicated but devoted figures, a coupling that changed the face of America” (Richmond Times-Dispatch).

Marriage is the most underreported story in political life, yet it is often the key to its success. Historian Betty Boyd Caroli spent seven years exploring the archives of the LBJ Library, interviewing dozens of people, and mining never-before-released letters between Lady Bird and Lyndon. The result “redefines the First Lady as an iron fist in a white glove” (Vanity Fair) and helps explain how the talented, but flawed Lyndon Baines Johnson ended up making history.

Lady Bird grew up the daughter of a domineering father and a cultured but fragile mother. When a tall, pushy Texan named Lyndon showed up in her life, they married within weeks with a tacit agreement: this highly gifted politician would take her away, and she would save him from his weaknesses. The conventional story goes that Lyndon married Lady Bird for her money and demeaned her by flaunting his many affairs, and that her legacy was protecting the nation’s wildflowers. But Caroli shows that she was also the one who swooped in to make the key call to a donor, to keep the team united, to campaign in hostile territory, and to jump-start Lyndon out of his paralyzing dark moods.

In Lady Bird and Lyndon, Caroli restores Lady Bird to her rightful place in history. But she also tells a love story whose compromises and edifying moments many women will recognize.

More »

After only an instant’s hesitation, Lady Bird replied evenly, “Lyndon was a people lover and that certainly did not exclude half the people of the world, women.” The unflappable Lady Bird had faced down one of the most renowned interviewers in the world and answered a potentially embarrassing question with honesty and grace. If Walters had researched Lady Bird’s early years, she could have anticipated the exercise of raw power was taken for granted, and managing it became vital to survival. Rather than strike back against an attack such as Walters’s, Lady Bird relied on the protective carapace she had begun developing as a child—it equipped her to spar, disarm, and vanquish while maintaining what looked like gentle, ladylike composure. Mrs. Johnson rarely talked about her early years. Perhaps she preferred to forget. More likely, she never knew the whole story—part Gothic novel, part comic opera—of how her aristocratic mother wound up giving birth on a December day in 1912 to her only daughter in a hardscrabble part of Texas that she loathed, among people she wished she had never met. Lady Bird’s father, the big, dynamic Thomas Jefferson Taylor (known as T.J.) was one of those men who had to feel he was the most important man in the room. At six foot three, he towered over most people, craved attention, and expected his behavior to be tolerated, no matter how outlandish. The deference he commanded frequently involved money, and he had ingenious methods to keep people owing him. One oft-repeated story had him manipulating an impoverished neighbor back into debt after the man had struggled hard to pay off the last cent owed. The story goes that T. J. Taylor knew the man’s weakness for cats and he offered to give him one, but the man, being scrupulously fair, insisted on paying a little something. The two settled on a minuscule amount, but that was enough to put him back on T.J.’s debtor list. While he wheedled to get what he wanted, T.J. also contributed generously to both churches in town, an effective way to keep the entire community in his debt. The local saying was: “T. J. Taylor owns everything.”

T.J. so firmly ruled that part of Harrison County, lending at exorbitant fees and collecting on his own timetable, that virtually everyone called him “Mr. Boss.” But not his wife, the pampered Minnie, whom he had lured to Texas from more cultured surroundings in Alabama. Miss Minnie called no one “Boss.” When the adult Lady Bird offered one of her rare descriptions of her parents, she called theirs a “stressful” union, and those words, though true, did not begin to capture the truth. Minnie Pattillo and T. J. Taylor grew up in the same Alabama county, but on different planets. Her father, Luther Pattillo (whose Scots ancestors spelled it Patiloch), had begun acquiring land after the Civil War, and by his shrewd (some would say exploitative) management, he had become one of the largest landowners in the state. While most sharecroppers in the region split 50/50 with their landlord whatever the crops brought, Luther Pattillo demanded 60 percent for himself, and because he owned so much land and the general store where many sharecroppers traded, he could get away with it. Luther and his wife, Sarah, liked to enjoy their wealth by moving around, from one of the homes they owned to another, depending on the social season and the school year. Wherever they lived, they maintained a large library and kept a piano in the drawing room so Minnie and her younger sister Effie could perform for guests. Effie got so proficient she set her sights on attending the Juilliard School in New York City, while Minnie remained the bookworm of the family, content to sit alone reading for hours at a time. Behind that genteel facade, of piano music and shelves of old books, the Pattillo household reeked of jealousy and malice. Sarah had been a Confederate widow with three young children when Luther married her, and she never let him Sarah. As a result of his ruthless business practices, he became known as “the meanest man in Autauga County,” but his offspring, proud of their self-made father, liked to lord it over their half-siblings and play up to him. Luther called himself a “general merchant,” and passed along the label (with the business) to his own son Claude, leaving his stepchildren to fend for themselves. If Autauga County, Alabama, had been more urbanized, the Pattillos would have looked at T. J. Taylor as coming from the wrong side of the tracks. In rural Alabama, the common phrase for people like the Taylors, who never managed to own much land of their own but had to eke out a living as tenant farmers, was “dirt poor.” Polished pianos and store-bought books were foreign to them, and they worried not about the winter social calendar but about winter shoes. Yet Autauga County was small enough that Minnie Pattillo and T. J. Taylor, born within months of each other in 1874, were bound to cross paths. Whether it was the romantic setting of his rescuing her after she had been thrown from a horse, as family lore had it, or some other, less dramatic meeting, the mutual attraction was strong. Standing alongside the much taller T.J., Minnie, with her many freckles and ruddy complexion, made his jet black hair and olive skin appear all the darker. Who knows what really drew Minnie to the untutored T. J. Taylor? One answer seems obvious. T.J. acted much like Luther Pattillo in his ambition and business practices, and if most women marry their fathers, Minnie was simply following that instinct. Minnie had a rebellious streak, and she may have found T.J.’s rough edges exciting, so at odds with the social snobbery she witnessed at home. Naturally, her parents were dead set against her having anything to do with T.J., and it was all too clear that she could register her defiance to them by

Naturally, her parents were dead set against her having anything to do with T.J., and it was all too clear that she could register her defiance to them by

sticking with him. For his part, T.J. set out on the fast track to prove himself worthy. Leaving Autauga with an older brother in late 1898, he managed to pay cash for 116 acres as soon as he crossed the Texas border. Where he got that $500 (about a year's wages for a working man) remains a mystery. He later told his daughter he had sold a saddle, but only a very elaborate saddle would have brought $500. And how would he have acquired such a saddle in the first place? His neighbors decided he must have robbed a train along the way. T.J. soon bought more land, swapping poorer acres for better, and when he opened a shop in Karnack, the sign he put out front, "Dealer in Everything," sounded like a bloated version of his future father-in-law's "general merchant." In November 1900, when T.J. returned to Alabama for Minnie, the Pattillos still labeled him "white trash." Acquiring a rustic little store in a speck of a Texas town did not catapult him into their class. Even if they made allowances for his lack of education, they weren't likely to forget that his mother had married four times and produced thirteen children, making her something of a joke to their society-minded friends. When Minnie persisted with plans to wed, her family refused to attend, and so the ceremony was a Taylors-only event at the home of T.J.'s older brother. If Minnie had known where T.J. was taking her, she might have reconsidered. With fewer than one hundred residents, Karnack, Texas, had only recently gotten its own post office. Marshall, the county seat fifteen miles away, had already become one of the wealthiest towns in that part of the state, and it would have suited Minnie better. Its strategic location, on the railroad connecting Dallas and Shreveport, made it a hub for commerce, and prosperous local residents had built imposing large homes along Washington Avenue and opened centers of higher learning, including a Female Institute. But a man on the make, like T.J., needed a set down his stakes and refused to budge. The marriage showed cracks from the start. Minnie made clear she detested her new home, and she wanted nothing to do with neighbors she saw as clearly inferior to herself. Most had never seen an opera or traveled outside the county. Her husband offered little consolation. His long workdays, as he continued to accumulate acres, meant she saw little of him. What she might have heard, she would not have liked. His reputation as a "ladies' man" was well deserved, and what's more, he didn't care a whit what people said about him. Yet Minnie stayed, at least for a while. The son she bore within a year of marriage was named for his father, but by the time the second was born, in August 1904, Minnie wanted a name that had nothing to do with her husband, and she settled on the exotic-sounding "Antonio." Before little Tony could walk, she left Karnack, taking both boys back to Alabama where she farmed them out to relatives, both T.J.'s and hers. To her family, she explained that she had left her husband because he was seeing other women. What had started out as a summer break for Minnie and the boys was going to last a lot longer. According to court documents T.J. filed in February 1909, Minnie had been gone four years and he wanted a divorce. Whenever he had written her to ask for an explanation, she had pled illness and requested more time to convalesce. But T.J. suspected she was not even with her family but had decamped to more appealing surroundings in the upper Midwest, possibly opera-rich Chicago or Battle Creek, Michigan, where she and all her family liked to go to take cures at the Kellogg Sanitarium. It's not clear where T.J. was getting his information, but his suspicion was confirmed when he received word from Michigan that Minnie, having left her sons in Alabama, was indeed a patient at the sanitarium. But, as the Kellogg

doctors informed him, she had recently undergone surgery and was unable to travel the "two thousand miles" (the actual distance was half of that) to answer T.J.'s charges. She was not too sick, however, to know what she wanted, and through her attorneys, she asked for alimony, payment of her attorneys' fees, and a share of the Texas property considered hers under the state's community property laws. Her counterclaim left out all mention of her two little boys, Tommy and Tony, whose custody T.J. was seeking. That response raised T.J.'s ire and, through his lawyers, he went after Minnie's father and officials at the Kellogg Sanitarium, demanding to know who was supporting his wife and what ailed her anyway. Luther Pattillo's response has not survived, but Dr. Bertha Moshier, an internist younger than Minnie, signed a statement on October 6, 1909, declaring that Minnie had been under her care in Battle Creek for "5 weeks" (only a tiny bit of the four years she had been gone) and that since she suffered from "nervous prostration" she needed a private nurse day and night. Travel was out of the question for "four or five months at least." Given Minnie's delicate condition, any trip sooner than that carried the risk of "permanent derangement." Now T.J. sounded baffled: if his wife was indeed suffering from "nervous trouble," would she not be better off in his "quiet country home [than in] a hospital where . . . numerous other people are being treated?" Minnie continued to dither, even accusing T.J. of taking unfair advantage of her by filing for divorce after he had encouraged her to seek treatment. She had never intended to abandon him permanently, she insisted, but in the meantime she refused to set a date for her return. As for the "valuable . . . real and personal property," accumulated during the marriage, her lawyers noted, she "avers that she has an interest." During the years Minnie was separated from T.J., she moved back and forth as "married" and "head of household." Neither parent claimed the company of Tommy and Tony, now aged nine and six, but a census taker found the boys living with T.J.'s older sister and her family in Alabama. When T.J. was granted his divorce nearly a year later (on February 6, 1911) Minnie was still in Alabama, but she immediately went into action. It was grossly unfair, she telegraphed her attorneys, that T.J. had won a "judgment by default," without her presence or participation, and she instructed her legal team to obtain a new hearing. Within weeks, T.J. and Minnie were back together. He dropped his case and she brought the boys to live with him in Karnack. He showed no signs of giving up his womanizing but he did offer Minnie one considerable consolation—a big, showy house, one of the most impressive for miles around. The couple had begun their married life in humble quarters behind the store, but during her absence he had purchased a two-story mansion (with seventeen rooms and six fireplaces) three miles south of Karnack. Built originally by slave labor and always called the Brick House, it had fallen into disrepair, but T.J., who resisted spending money on any personal pleasure, spared no expense in turning the house into one of the most elegant in the county. He put huge white columns out front—giving Minnie something to flaunt if her picky Pattillo kin ever came to visit. Even without the house, Minnie had her reasons for returning to T.J. She still felt drawn to this big, commanding man, for whom she had once bought barbells and a mat for workouts. More importantly, he provided an escape from the

infighting of Luther Pattillo's household in Alabama, where one of his stepdaughters, a widow with four children, had recently returned to live. The always festering resentment between Luther's own offspring and those of his wife Sarah could only grow, now that both parents were failing in health and questions about inheritance became more pressing. In fact, both parents died within months of Minnie's going back to T.J., and Luther, who managed to survive his wife by only a few weeks, made sure to funnel the bulk of his estate to his own blood, leaving only a pittance to each stepchild. That gave Minnie, now heiress to almost a quarter of her father's holdings, ample reason to put some distance between herself and her disinherited half siblings. Her new wealth wasn't hers to spend immediately—it came in land and revenues to be turned over later, when acres were sold and loans paid back. Even if Minnie had inherited a ready fortune, Southern ladies did not go off to live on their own. Certainly not a woman in her forties with two young sons. All through the turmoil of the divorce proceedings, the statements of Minnie's attorneys highlight the importance of money. She knew that T.J. had become a wealthy man in her absence, owner of thousands of acres of cotton-growing land. By renting to farmers who paid him back with a share of the crop, and by supplying those same folks with most of the store-bought items they needed, "Mr. Boss" held them in what even his loyal relatives described as a kind of peonage. His continuing good fortune was virtually assured by the fact that his neighbors could not avoid dealing with him—he owned the gins they needed to process their cotton. If Minnie had accepted the terms of the divorce, she would have lost a lot. On December 22, 1912, little more than a year after Minnie returned to T.J., she gave birth to a

baby girl with large brown eyes. Dr. Baldwin, living just over playmates—Stuff and Doodlebug—who preferred something more vivid than Claudia. Later, it was "deemed more respectable to assign credit to the nurse" and avoid any mention of interracial socializing. Nobody suggested that Minnie liked being back in Karnack. She still found it a dreary, lonely place, populated by people who knew nothing about Italian opera or her favorite authors. She had no close friends, and kept clear of her neighbors, who considered her "wacky." She sometimes accompanied T.J. to the store, then walked the three miles back to the Brick House alone. But more often she rode alone in her chauffeured sedan, a veil covering her face. When she went out for a walk, she loped solo through T.J.'s acres, her long skirts swishing through the grass and her reddish blond hair blowing in the wind. Local residents saw her as a dreamer at heart, a woman who yearned for life on a bigger stage than Karnack could offer. It was that deep, overpowering yearning that she passed on to her only daughter. For her sons, Minnie wanted exposure to a world beyond Texas, and soon after Lady Bird's birth, she dispatched both boys to boarding schools so distant they would find it difficult to come home, even at Christmas holidays. At first enrolled at Riordan, an upstate New York school known for its progressive ways, they were then split up, with Tony transferring to a school in New Mexico. That meant the two brothers, just entering their teens, were deprived of the comfort of each other's companionship, and their little sister saw neither of them. Minnie showed scant interest in making amends for taking the boys away from their father earlier or for leaving them with relatives while she traveled for cures and
